

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE BRITISH CONTROVERSIALIST,

AND

IMPARTIAL INQUIRER:

ESTABLISHED FOR THE PURPOSE OF FORMING A SUITABLE MEDIUM FOR
THE DELIBERATE DISCUSSION OF IMPORTANT QUESTIONS IN
RELIGION, PHILOSOPHY, HISTORY, POLITICS, SOCIAL
ECONOMY, ETC.

"DIAGNA EST VERITAS, ET PRÆVALEBIT."

Some may take exception to the form of these writings, because they are chiefly controversial: but no objection can be more futile. Our land has become glorious through controversy, and there has the mind of England put on more of might than on the battle-field of truth. The greatest works our country can boast of take this very form. What were left to us of our Hookers and Barrows, our Taylors and Miltons, if their controversial works were excepted? The truth is, whoever would have knowledge respecting doctrines and principles that are still unsettled, whether in religion or in science, must seek it through this form, or be altogether disappointed."

VOLUME III.

LONDON:

PUBLISHED BY HOULSTON AND STONEMAN,
65, PATERNOSTER ROW.

1852.

LONDON:
J. AND W. RIDGE, PRINTERS,
11, Bartholomew Close.

PREFACE.

TIME, with his steady but noiseless step, has well nigh completed another annual round, and the old man, with a genial smile, seems to intimate that we must make up this volume if we would allow him to place it in one of the niches reserved in the great temple of literature for the intellectual products of the present year. In order to secure his proffered services we cheerfully take the hint, and in a few brief sentences mark the termination of our labours for this year, with anticipatory references to their resumption in the next.

Of our controversial department much need not be said. In this volume, as in the preceding ones, great questions of deep and absorbing interest are calmly and philosophically discussed; every subject taken up is presented in various phases, by which a spirit of pure eclecticism must be imbibed by every thoughtful reader. The novel experiment, commenced in 1850, of establishing a magazine, "open to all, but devoted to *truth*," has been continued to the present time with unvarying success. We have proved by the forceful evidence of fact that it is possible for earnest men of every party to meet upon one common platform, and to discuss, in a spirit of kindness, their various opinions. In doing this we have not only established a great principle, but we have worked out details, and thus we believe we have served the great cause of truth, and promoted the highest interests of humanity.

We can also point with pleasure to the other departments of our work, and particularly to those which are specially devoted to the service of those who are pursuing a course of self-instruction and mental culture. The leading articles on "Rhetoric" are eminently adapted to such; and, with the preceding ones on the "Art of Reasoning," they will be found to constitute a body of thought and information which must be regarded as doubly valuable to all who desire to influence their fellows by their voices or their pens. The "Prolegomena" on European Philosophy will show how extensive is the field over which the projected series of papers will range, and how varied, and yet, withal, how rich, are its products, as well as the sterling ability with which the topics announced are likely to be treated. "The Inquirer" still increases in the number and importance of its queries, and in the value and appropriateness of its responsive "words of wisdom." "The Young Student and Writer's Assistant" has occupied its new positions of usefulness with great success. Having through the Logic Class and extensive communication with our readers ascertained that we had gathered around us a very large number of self-instructors, and being anxious to render them additional aid in the best possible form, we commenced with the present year two new classes for regular courses of instruction in Grammar and Mathematics. In these we immediately enrolled nearly 300 members; the majority of whom have continued steadily to pursue their studies with the most satisfactory results. We review these labours with pleasure, and rejoice in the thought that we have been able to contribute no insignificant quota to the cause of popular education and intellectual enlightenment—a nation's surest guarantee for freedom and progress.

There are circumstances connected with the history of this volume to which we may here refer, as otherwise, perhaps, no notice might be preserved of them. We mean the special efforts which have been made to bring our magazine under more general attention,

and thus to aid in increasing its circulation. In the month of August last we expressed a wish, in contemplating a northern tour, to meet our subscribers and friends in some of the towns through which we should pass. This course was novel, but not unwise. The old Lydians had a tradition which stated that one of their kings had the good fortune to discover, in the bowels of the earth, a ring which had the marvellous property of rendering him who wore it invisible to the eyes of his fellows. Such a ring all editors consider themselves privileged to wear; and we, although one of our number was contented to leave his ring in the sanctum, and appear amongst our readers in proper person, are not indifferent to the occasional advantages of this privilege. The meetings thus attended were of the most interesting and stimulating character. Mutual interest was felt and increased, and in every case energetic measures were spontaneously resolved upon for furthering the interests of this work. These meetings suggested others, and now, in nearly all the large towns in the kingdom, there have been earnest conferences amongst our friends. If it be inquired, what is the object of all these? we answer, to place the *British Controversialist* in a position of greater strength and safety, by securing for it at least the desiderated monthly circulation of 10,000 copies. That this is quite attainable we firmly believe, although the thoughtful and impartial character of the magazine may render considerable effort for it necessary. We are fully aware that we might have been more popular had we aimed at being less useful; but we do not desire to widen the range of our influence by decreasing its depth and beneficial power. We believe that there is a very large and rapidly increasing class of persons who are prepared to appreciate our journal, and we ask for its introduction, under favourable auspices, to them. We are desirous of this and its attendant results, that we may be enabled to continue our work, in all its sections, with renewed vigour, and to pursue with energy those fresh paths of usefulness that lie before us.

We are desirous, in January, 1853, of opening an Elementary Mathematical Class, a new Logic Class, with Sections for *Tyrones*, *Protectiores*, and *Seniores*, and subsequently Classes for General History and Geography, &c., and to award prizes and certificates of merit in connexion with each. The expense incurred by these improvements will be very considerable, and we cannot, of course, meet it without adequate returns. In the spirit, therefore, in which we first offered our services to the public and awaited their decision, we now submit these projects to our friends, and leave it for them to say whether we shall carry all of them out or not. We have confidence in the interest and zeal of our readers, and we leave the cause of *their own* magazine in their own hands.

But we must not lose ourselves in the contemplation of the future, nor fail to express our soul-felt gratitude for the favours of the past. Never was this more justly due, or more cheerfully and sincerely rendered. Friends, subscribers, and contributors, we thank you all! And while we solicit the continuance of your support, we promise honestly to endeavour to be still more worthy of it. We shall use our utmost efforts so to elevate the mind of society—

“That truth no more be gagged, nor conscience dungeoned.

But that all men may have due liberty
To speak an honest mind in every land,
Encouragement to study, leave to act
As conscience orders.”

THE BRITISH CONTROVERSIALIST.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. I.

THAT "the *manner* of speaking is as important as the *matter*," is a maxim as false as it is superficial, and as detrimental to the cultivation of true Eloquence as it is false. For what purpose is it that man fashions the subtle and delicate air into wise and melodious words, and gives them wings, as angels, of persuasion or command? It is that he may express Thought. We have no objection to the mere act of elaborating a cunning web of bright and exquisite words, but let these words at the same time embody and contain something that will not only charm the sense of harmony, but captivate and gratify the intellect. Let Language be constructed so as to give the greatest possible amount of pleasure and delight, but let it also furnish the mind with something that will instruct, amuse, and exalt it. Thought—thought that is the grand desideratum of our age; let that be but gained, and then it may be draped in words as lustrous as star-gleams—a lustre which will not only adorn but illumine the thought. To *think* is our first duty, to express our thoughts is the second.

We know full well, that in laying down the proposition that there is a Science of Rhetoric, we expose ourselves to the questioning of objectors. What! we shall be asked, do you wish to circumscribe, restrain, and curb Genius—that glorious inspiration and semi-divine madness? What Rhetorical art gave Homer instruction before he improvised the "Iliad"? Who taught him the principles on which the "Odyssey" should be constructed? Do not those two poems rise up like twin-born stars amid the darkness of an intellectual chaos? Before these, was not all gloom? Whence, then, gained he his light? "The thousand-souled Shakspeare," too, has he not built himself "a livelong monument" in the profoundest depths of human hearts, and when did he study Rhetoric? Where is the heart-string which he has not touched—where the passion which he has not represented—what recess of that "mighty mystery," the heart of man, has he not unlocked without its aid?

"Rise, hallowed Milton, rise, and say"

by what sage Rhetorician's rules thou wert informed how to ride

"Sublime

Upon the seraph wings of ecstasy,"

and what "*principles of composition*" did he impress upon thy glory-visioned soul? And

there is Burns, likewise, the bard who sung the homely joys, the simple loves, the keen-felt sorrows of the humbler ranks—

“ And rustic love and poverty
Grew beautiful beneath his touch ”—

pray tell us, if thou canst, from whom did he acquire the art of thought-expression? Is not Nature the best teacher, and are not her pupils better fitted

“ To snatch a grace beyond the reach of art,”

than those who are

“ In outward show
Elaborate, in inward less exact ? ”

It would be easy, indeed, to answer all these queries by others, which would bear the appearance of—ay, and possess—as much accuracy and point. One, however, will be sufficient for our present purpose, viz.:—Who are those who compare themselves with Homer, Shakspeare, Milton, and Burns, and demand equal exemption from the bondage of law and rule, upon the ground of possessing a genius of an equally lofty character? But we prefer to reason the matter, and hence we look at the subject in the following points of view:—There is a certain power of persuasion possessed by the generality of men, and exerted by them with a greater or less degree of efficacy in their every-day walk and conversation. If, then, we believe that no effect can happen without a cause, we must believe that there are causes in operation which coincide in producing this efficacy of persuasion. If these laws are discoverable—and that they are, few will, we presume, be inclined to deny—there is a possibility of constructing a system of the laws of expression; and having a knowledge of these laws, we might elaborate from them an art which would enable us to express our thoughts in such a manner as should at the same time please and instruct; at least we shall have a greater likelihood of being able to do so than if we trust to mere random and impulsive promptings; for if there are laws of Nature which declare that such and such modes of expression are expressly adapted to the production of certain effects, to know these laws, and to follow them, must be the best method of gaining these ends. A carefully-digested science, whose principles have been culled from a clear, judicious, accurate, and cautious interpretation of experience and observation, is regarded by all men as a fundamental point in any art; a systematic study of the laws by which phenomena are producible, is generally considered as indispensable to every one who desires to labour in the production of such effects; a well-defined series of canons, together constituting a theory, is admitted to be necessary to the success of any course of procedure having for its object the accomplishment of certain ends; and there is no good reason why it should not be so in the case of Rhetoric. It is true that we may be told that Genius is self-sufficient; that its intuitions are the best guides it can have; that it is possessed of a noble daring which enables it to burst the fetters of rule, and to gain a higher excellence than that produced by the careful and elaborate study of sciences and arts. If this be truth, then it is in opposition to the universal experience of mankind, which asserts, that true excellence is only attainable by painstaking laboriousness, frequency of repetition, *and acquired accuracy, skill, and aptness.* The acquirement of the happy choice of terms, *the severe economy and selectness of phraseology, the exquisite accuracy and precision, as*

well as forceful brevity of expression, the melodious harmony and pointed appropriateness of diction for which all great authors are remarkable, must be, in a great measure, the result of patiently-conducted toil, carefully-directed and assiduously-pursued study. It is not Genius but Mediocrity that finds restraint galling; and the reason of this especial disgust which Mediocrity affects for the trammels of system, may be found, in some instances, in the self-sophistry of the idler and the sloven; in others, in the mistaken idea that whatever is unintelligible is necessarily profound; in all, however, the chief reason is, that scientific systematicity is the sworn foe of ambiguous, incongruous, and mystically oracular phraseology, of carelessness and extravagance of diction, and of opacity and disjointed expression, and is distinctly hostile to the inflated and jejune conglomeration of words which Mediocrity would fainly believe to be "fine writing." Such writers do not believe that "the greatest art is shown in concealing art," but that the greatest art is shown in having no art at all. There cannot be a greater mistake. The great thoughtsman must do with his ideas what Domenichino is reported to have said he did with regard to his pictures, "I am continually painting them within myself." If

"Speech is the golden harvest that followeth the flowering of thought,"

it must only come when thought is in its highest state of cultivation, maturity, and perfection; and it must require patient toil, perseverance, and self-denial so to cultivate and mature it. If, however, it require these, it must needs be the result of art, and every art implies a method or science. Just as the painter, by the close and vigorous application of his mental powers to the drawing of geometrical figures, in order that he may gain correctness, readiness, and accuracy of touch, fastidiously rejects even the slightest deficiency between the ideal and the art-executed, and by the minutest and most painstaking exactness, gradually acquires such harmony and naturalness of expression, that the whole appears to the uninitiated eye, simple, easy, unconstrained, and artless; so ought the world's thought-painters to exercise, to educate, and to habituate themselves. "*La véritable éloquence suppose l'exercice du génie et la culture de l'esprit.*" *

We are not admirers of "that glib and oily art"—that studious aiming at the production of prettinesses and pettinesses—that exhibition of the gift of fluent speech,

"And how to talk about it and about it,
Thoughts briak as bees, and pathos soft and thawy,"

at which some affectationists aim; nor yet of that bare, bleak, barren style of writing, in which there is no play of the imagination or the fancy, but where all is as plain, as unornamental, and as dry as a series of mathematical demonstrations; but we do admire that mode of composition which, while it instructs the intellect, warms the heart, and calls the ideal into life and being—which is clear, precise, unambiguous, easy, and expressive,

"With here and there a violet bestrewn"—

which is the result of the action of Genius disciplined by Taste and cultured by Common Sense—of the conjoint and concurrent exertion of the deliberative understanding, the

* "*True elegance implies the discipline of the taste and the culture of the mind.*"—Boswell.

intuitive perceptivity of the mind, and the emotions of the beautiful and the sublime. But although this is the style of thought-expression which we admire, we may be permitted to remark, that we are not by any means desirous of insinuating that our own style is an example of what we would wish others to acquire; so far is this from being the case, that we eagerly, and as an act of justice to the science of which we are about to become the expounders, seize this opportunity of disavowing such egotistical arrogance. We are perfectly sensible of the peculiar vices of our own style, and exceedingly anxious to improve, refine, and chasten it; but a long course of reading and of study, which involved a characteristic mode of thinking, has so entwined this method of expression around our mind, as a habit, that we find our thoughts so irresistibly fashioning for themselves the vesture in which they desire to appear, that we are but faintly able to modify and alter it as we could wish. Now, though we know that there is a common proverb which asserts that "Example is a superior instructor to Precept," yet we humbly hope, that as we shall bring forward specimens and illustrations culled from the most eminent of the world's thoughtsmen, the "conjunction and the mighty magic" of their names will far out-balance the example offered by such humble, though earnest, Wisdom-worshippers as we. At the same time, and once for all to dismiss personality, allow us to say, that it is not absolutely necessary that an instructor should be in himself a perfect and unimpeachable master of the art or science which he professes to teach; his duty is rather to have a power of perceiving the perfect, understanding why it is so, explaining the *rationale* of that art or science, and leading the mind to contemplate and admire the labours, discoveries, and doctrines of the chief cultivators of that branch of knowledge or taste. Although, therefore, we shall assert with Horace, that with regard to style

"Omne tulit punctum, qui miscuit utile dulci,"*

and though the spirit of our teachings shall be similar to that of Lucian, who says, "Let your style be neither vulgar nor pedantic, but such as the unlearned may comprehend, and the scholar admire," yet we hope we shall not be considered as at all implying that our own manner of composing is faultless, but that our strictures may be applied to ourselves as well as to others, and that no defects of ours should be considered as evidence of the incompetency of such a systematic body of principles and rules as the science of Rhetoric supplies to aid, direct, restrain, improve, refine, and exalt. There is another objection urged against the study of Rhetoric, which it behoves us to notice in an introductory paper like the present, viz., that which regards Rhetoric as an ensnaring and insidious art, whose object is, not to convince, persuade, or win the intellectual assent, but to stimulate the affections or passions, captivate the taste, and by mere artifices of diction and arrangement, by mere embellishments of manner, to distract the mind, and disturb the equilibrium of the intellect,—which considers Rhetoric as calculated to be of use when we wish

"To dash maturest counsels, and to make
The worse appear the better reason."

Now it is true, that when the teachings of Rhetorical science are made the guides of our

* "*He has effected every point who has combined the useful with the agreeable.*"

practice, it becomes an instrumental art, and, like all other arts, it may be employed for the accomplishment of deleterious purposes, and the gaining of improper ends. This admission, however, instead of being regarded as a satisfactory reason for neglecting this study, ought rather to make us determine to

“Smack of observation;
Which, though I will not practise to deceive,
Yet to avoid deceit, I mean to learn.”

This is a wise resolve; for to understand the fraudulent arts which may be employed, is the best way of guarding against being misled, cajoled, or deluded, at the same time that such a knowledge will enable us to detect and expose the party who makes use of words which are merely *clothed* in Reason's garb, which are merely the spurious counterfeits of truth and wisdom.

Expression is a power—a power which all should strive to make their own. There are men whose reason can scan the wide-spread hemisphere of truth; who can feel the rapture and the joy of thought-conception; who can for a time imagine themselves emancipated from their prison-house of clay, but who are unable to give an account of the thoughts which stir within them, of the mighty joys which they have felt. These are dumb prophets—non-conductors of the sacred electricity of thought; idea-recipients, whose lips have been sealed by the finger of Silence; men who can read the oracles of heaven, but are incapable of translating them into the dialect of this nether earth. Thus the great mission of their being remains unaccomplished, simply because of the want of that self-training by which Genius is enabled to bring from the mount of inspiration the burden of the celestial harmonies, and make them audible to our “unpurged ears.” But though thought-expression is a power worthy of being anxiously striven for, and sedulously cultivated when attained, yet, it must be admitted, that there is a seductive influence frequently brought to bear upon those who have attained a masterful skill in this splendid art, which ought carefully to be avoided, viz., the likelihood of loving, thirsting after, and pursuing, present applause and honour, unmindful of the true dignity and utility of the art, of the true glory of one who devotes his powers, energies, and acquisitions, to the elevation and ennoblement of humanity. Such *ought* to be the object which every student of Rhetoric should have before him in his study of the subject; at the same time, we must admit that this is not one of the essential characteristics of Rhetorical art; *in itself* it has no moral nature. The object of speech is to express thought so as to convince, persuade, and bend the minds of others to purposes of our own; the application of this power for good or evil depends, therefore, not on the science of expression, but on the nature of the mind which makes use of this instrumentality. If that mind be subdued to truth, if it be suffused with a sense of moral duty, it will be sincere, virtuous, and truth-loving, and this instrument will be mighty and powerful for good and virtuous results. If, on the contrary, the mind be under the dominion of falsehood, if it be not under the guardianship of the moral sense, then it will be insincere, hypocritical, and disregardful of truth or righteousness, and the knowledge which this science yields will be artfully employed in the subversion of the good and the true, in the propagation of error, falsehood, and wrong. But how will this be attempted? Not by the unblushing avowal of its purpose, but by the borrowing of weapons and dress from the arsenal and wardrobe of Truth; and in this

hypocritical semblance—a demon in the disguise of “an angel of light”—going forth on a warfare in which Truth is attacked and impugned by one who represents himself as the devoted servant of Truth. That Eloquence may be prostituted to an improper end—that it may be employed in the service of vice and of falsehood—that it may be degraded to act as the advocate of injustice—that it may rouse, inflame, and agitate the passions, and add the tremor, the delirium, the madness, and the imbruted fury of the evil principles of human nature, to the misguided and misinformed intelligences of certain classes of men—are no arguments against the study of Rhetoric, but rather motives to spread more widely and generally a knowledge of the subject, so that art may be met by art, and hence the evil influence of art be rendered of “none effect.” But the chief and paramount reason for the study of Rhetoric is, that by applying principles of philosophical observation to the objects which impress and influence the finer, the nobler, the more exalted faculties of the mind, we may learn the laws which they follow, and employ similar means to produce similar phenomena. By having a knowledge of these laws, we are enabled to conform our own compositions, to a certain extent, to their dictates, as well as to use them as means of judging of the performances of others; to habituate the mind to the artistical execution of its aims, and to the analyzation of the principles upon which the mind feels, judges, and decides; and thus we impart to our own endeavours the accuracy and elevation of philosophy, while to philosophy we add the fluency, the attractiveness, and grace of the fancy and imagination, and both are gainers by the interchange. In this point of view it seems one of that series of studies which is implied in mind-culture, and which it is absolutely necessary that every one should study, whose object it is to employ language accurately in the expression of thought, and to employ the chief instrument which he has for conveying the ideas which arise in him to the intellectual and immortal spirits by which he is surrounded.

Rhetoric, according to the view of it which will be presented in the following papers, may be defined as the SCIENCE which instructs us how we may best impart information, effect conviction, induce persuasion, and communicate delight, as well as the ART of employing language most efficiently for the accomplishment of these purposes.

Grammar is the science which informs us how to inflect words correctly, collocate them properly, and arrange them methodically. Logic teaches us how to reason accurately; and Rhetoric enables us so to exhibit our thoughts to others as shall most certainly effectuate the end which we purpose to ourselves in speaking.

It will appear from the above-given definition, that there are several activities of the mind to be operated upon and excited, viz., the Intellect, the Imagination, and the Emotions, and that the excitative agencies which are to be employed in the accomplishment of these purposes are words—

“The passion-winged ministers of thought.”

Our attention, therefore, in our next paper, will be directed to the consideration of the instrument of Thought-intercommunication and Language—that agency by which the transient thoughts and words of men are preserved, embalmed, and treasured up in *imperishable signs*.

Philosophy.

IS HOMŒOPATHY TRUE IN PRINCIPLE AND BENEFICIAL IN PRACTICE?

AFFIRMATIVE ARTICLE.—I.

HOMŒOPATHY is the name by which we understand the discovery of a law of nature, by the application of which, not only actual diseases can be radically cured, but the predisposing cause of disease detected and eradicated, so that its *active* development may be prevented. I say a *discovery*, but by this I only understand that a fixed principle, already known and applied in a limited sphere, was discovered to possess a universality, and was brought to bear upon all phases of disease. Homœopathy, by rejecting means and substances which act detrimentally upon the nervous system, and tend to exhaust the essential energy, without which vitality sinks; by regulating the provision of aliment, from which it discards all medicinal and stimulating substances; by attending to the general hygiene, and by employing specific remedies against the disorders already in active progress, has the power of obviating and of eradicating the predisposing cause itself, and of effecting the ultimate cure and emancipation of mankind from bodily ills, and consequently from mental disorders which arise out of them as sympathetic results. Indeed man was ordained by nature to suffer. His ills were acquired through *ignorance*, that original sin. Science, however, it is felt, will free him eventually from those sufferings, to which his own folly and superstition have hitherto made him the martyr. I have already fully explained these things in my paper on the Predisposing Causes of Disease, published in the "Pioneer," No. 14, and the "Hahnemannian Fly Sheet," Nos. 18, 20, and 21.

Homœopathy, besides the benefits above stated, has the merit of making the physician more attentive to the exact consideration of the symptoms of disease (hitherto somewhat neglected in the investigation), by which diseases are more systematically distinguished. It also leads him to insist upon his patients attending more particularly to the rule of diet. It has already shown many physicians the non-necessity of

such immense doses of promiscuous drugs as were heretofore given, to the great detriment of all constitutions, and more especially of those whose natural weakness rendered them more constantly the subjects of such treatment, whilst it deprived them of the energy to expel the mischief thus incurred. It leads to a more certain testing and acquaintance with the specific properties of medicine, and it has promoted much valuable investigation into the province of the *Materia Medica*. It avails itself of numerous agents, which are, when comminuted, all-powerful for good, but which were hitherto believed to be *inert*. It introduces more simplicity in the dispensing of prescriptions. It directs more attention to the preparation of medicine, and keeps a strict watch on the apothecaries. *Homœopathy will in no case do positive injury*; it gives the system more time to rest, and recover itself undisturbed; and both from the definite nature of its treatment, and the security and the brevity which characterizes it, it immensely decreases the expenses of cure.

The founder of this beneficial method of cure raised himself by his genius and benevolence to the highest eminence as a benefactor of mankind. Samuel Christian Friedrich Hahnemann was born at Meissen; was educated at Leipzig and Vienna; took the degree of Doctor of Medicine at Erlangen in 1799; discovered and published his method in 1810; translated *Latin, English, French, and Italian* works of science; wrote in *Latin* and his own (the *German*) language seventy-nine scientific works. He had an immense practice, and ended his useful and glorious life on the 2nd of July, 1843, in full possession of powerful intellect, and at the advanced age of eighty-nine. The principle of cure proclaimed by him, "*Similia similibus curantur*," signifies, administer for the purpose of cure the medicine which produces on the healthy subject the group of symptoms the most similar to those produced by disease. The era of this bril-

liant discovery is scarcely forty years distant, and it has already ceased to be a novelty. None of the medical schools number so many conscientious adherents; it is practised in all civilized countries; it has its representatives in every part of the globe, and its dispensaries and hospitals in most of the capitals and larger towns of Europe and America. The works treating of Homœopathy are sufficient to fill libraries; and the most remarkable feature in them is, that they are all the development of the same principle, and have nothing common with those sad and fatal debaucheries of imagination which have rendered the medical profession an object of ridicule for philosophers, and of deception and distrust for the community. Homœopathy has no theory but the logic of facts—no principle but the law of nature; it is as evident as an axiom in geometry, and as certain as the law of gravitation and rotation of the globe. Homœopathy has rendered all dangerous disease amenable to the salutary action of its remedies. It is now well tested, and constitutes the only real method of effectually treating all disorders to which the animal organism in general is subject. Homœopathy has the power, not only of curing, but of effectually

preventing, by its *specifics*, many disorders called Epidemic, namely, small-pox, scarlatina, measles, typhus fever, cholera, hydrophobia, &c. Homœopathic practitioners, endowed by Hahnemann with the knowledge of the origin of chronic diseases, and the mode of treatment to which they are specifically subject, possess the means to eradicate and to prevent them; they make use of the same remedies that other schools do, and differ from them only in their method of preparation, dose, and application. All the so-called *separate* systems for the cure of diseases, namely, Hydropathy, Mesmerism, Galvanism, &c., are all subservient to the same law of nature upon which Homœopathy is based; and it is worthy of remark that they are all only effectual when applied according to that law. Homœopathic practitioners reject no *reasonable* method of treatment—no method of treatment by which they incur no *risk* of *unforeseen mischief*; they use all these medical auxiliaries when they are Homœopathically indicated. As to the proofs of the efficacy of Homœopathy, these are now a mere matter of statistics; our hospitals, dispensaries, private establishments, and our books, are all open to inquiry.

G. V., M.D.

NEGATIVE ARTICLE.—I.

PUBLIC attention has, of late, been much arrested by a serious commotion in the medical world; the convulsive throes which agitated the community, like the periodical ebullitions which disturb nations, served to betoken the advent of some great revolutionary movement. But, alas! it was only a verification of the old quotation—“*Parturiunt montes, et nascitur ridiculus mus.*” Like the frogs in the fable, the wonder and respect early developed for the new comer, speedily yielded to feelings of most undisguised contempt. Upon investigation, it was discovered that a German apothecary, named Hahnemann, had introduced a new method of treating diseases; after consulting popular taste, and finding it decidedly prejudiced against the nauseous draughts and boluses which the old-fashioned medical men so liberally administered, he professed to *have invented what he* denominated the *Globular Theory*; that is, instead of giving *pills by the dozen, like Morison and Co.,*

and the other champions of quack systems, he prescribed infinitesimal doses, treating cases of the most complicated character by the employment of the trillionth or decillionth of a grain of substances which previously had been considered utterly inefficacious.

There is no doubt that the great anxiety which many members of the profession have evinced to crush the new system has mainly contributed to bring it more openly before the notice of the public. Had a more judicious course of proceeding been adopted, had Legitimate Medicine stood undaunted upon her own truthful basis, instead of having to treat the nuisance as a sturdy opponent, it might have been introduced still-born into the world, and forthwith consigned, with its most illustrious progenitor, to that most appropriate domain in the regions of space—the limbo of fools. Yet, notwithstanding, we cannot but be astonished at the progress which the heresy has made, and we believe

that the readiest mode of accounting for it is in the following manner:—

The science of medicine has always been in advance of the age; indeed, hitherto it was impossible it could have been otherwise: the empirical approximations of our forefathers to the true light, only led them more carefully to veil from vulgar eyes, by mystic processes and cabalistic combinations, the wondrous knowledge they professed to have acquired. But latterly it has been different. The partial insight into the working of nature's laws, which the many now acquire as part of an every-day education, has produced its inevitable consequences. They have been awakened to the realization of the possession of a power, and that power they are determined to exert to the fullest extent in criticising both men and principles. A man feels ill, a little of what he calls biliousness; he is not going to send for a physician; no, he'll "physic himself." If he has a grain of common sense he takes a purging draught, and gets well; but, perhaps, he dabbles a little in science, and thinks he has a right to exercise his own judgment; he has heard of some specific, some nostrum with a wondrous long name, to which the usual appendage of *pathy* is affixed; he inhibits the dose, whatever it may be, and if cured well and good, another testimonial for the efficacy of the remedy; if it prove of no avail, there are five hundred good reasons which can be produced to account for its failure, and he goes the round of advertisements again, in hopeful expectancy of discovering the true panacea.

Now, we have pictured no uncommon case. Look at the columns of our papers and periodicals; there are few, if any, well-certified chronic cases of cure, and even these may be easily accounted for by the very simplest causes. But to the point. Homœopathy is our subject for the present, and we will deal with it as plainly and concisely as possible.

There are three fundamental methods of cure—the Allopathic, the Antipathic, and the Homœopathic. The two first of these are constantly employed by every practitioner in the kingdom; the last is a system which, on many accounts, deservedly ranks apart from all others.

The aphorism, "*Similia similibus curantur*," is the basis of the whole fabric. "*Like cures like*," explains the anomalies in the

action of complex medicaments, no less than in the use of the simpler therapeutic agents: to reduce a plethoric constitution, prescribe rich viands, and plenty of them; to cure the dropsy, drown your patient with water! These are obviously fair deductions; a great principle, if correct in a single enunciation, may be under the same circumstances applied, without fear of error, to more than one. But the Homœopathist may answer, "You acknowledge this truth in many of the common affairs of life; the application of snow to frost-bitten parts restores the circulation, and in burns or scalds we relieve the pain by exposure to the affecting cause, or heat." Doubtless we do; but who would immerse a snow-nipped member in spirit, or submit to the dull cold of an evaporating moisture, and expect relief? Are there not other remedies to be applied to a scalded hand of a more soothing nature than to hold it by a scorching fire?

But even granting all this, are we to adopt uncompromisingly an hypothesis founded upon imperfect deductions from a few simple facts, when the every-day experience of the commonest practitioner is directly at variance with its fundamental laws? Some of our most potent medicines are far from being Homœopathic in their action or character; agents which destroy the *Acacus Scabiei*, or itch insect, are incapable of developing that disease. Medicines which cure intermittent fever, if taken in sufficient quantity, will develop, not remitting, but constant fever—forms of disease, it must be remembered, differing considerably from each other. We could multiply cases of the same description without number, but the inaccuracy is evident. The claim to originality in the treatment set up by the Homœopathists is no less unfounded than their other assumptions; it has been practised to a certain extent from the earliest times, and is suggested by the common sense of every person who gives the subject a moment's consideration. A man has a tendency to vomit; by tickling the fancy the object is attained, the stomach is relieved. Excessive stimulus, either of meat or drink, produces internal irritation; we combat the disease by increasing that irritation to assist the expulsion of the offending matter.

But even admitting their therapeutic treatment to be feasible, or perhaps advis-

ble, we must protest most emphatically against the globular part of the business, and refuse our credence to a theory which would fain persuade us that the effect is in an inverse ratio to the cause; that though an atom too small for estimation will work the most wonderful results, dozens of such atoms would pass through the system without effect. Is it not the acme of absurdity for one moment to suppose that substances which even when administered in copious doses hardly prove efficient, when diminuted beyond the perception of our most refined senses, produce cures more than miraculous? Fancy the ignorance of the man who will assert that he can empirically prognosticate the action and effects of an agent, which but the nicest analyses of a Herapath could detect, and of whose actual presence the prescriber himself could give you not the faintest shadow of a proof! We do not despair some day of lighting upon an advertisement offering to feed large union or convict establishments upon the Homœopathic principle (pity they could not include the clothing too!); or provision packets for searching squadrons, warranted not to weigh more than a few ounces!

A medical man may carry the whole Pharmacopœia about in his pocket; nor do we see any reason why a patient should not make assurance doubly sure, and swallow all of it in a single dose, diluted to the x^{th} —1 extent. We beg to adduce a few specimens of the Homœopathic doses:—

Charcoal, 2 decillionths of a grain!

Opium, 2 decillionths of a drop of a spirituous solution!!

Nutmeg, 2 millionths of a grain!!!

Our readers may think that we are joking; we were never in more sober earnest. Any one who has a spare half hour to throw away in perusing the treatises on the system* may satisfy himself of the truth of our assertions. In the French edition of Hahnemann's *Materia Medica*, no less than 45 octavo pages are devoted to the statements of 720 symptoms produced by the one-millionth of a grain of vegetable charcoal! Among the many effects ascribed to this agent we find, "*itching of the internal angle of the left eye*;" "*itching of a wart on the*

left finger;" "*repugnance for butter*;" "*speedy loss of appetite by eating*," &c., &c. Many of its observations are filthy and obscene.

Shades of Hippocrates and Galen! if ye could but re-visit the degenerate followers of your mighty selves, and view the unfathomable abyss into which they have madly plunged the science whose birth ye cherished, and whose cradle ye rocked, would not your venerable old faces flush with resentment at the arrogant presumptions of the motley crew, and hasten to sever, in an agony of disgust, the links which connect your great names with a profession which despises and rejects your teachings?

The ordeal of experiment, no less than the tribunal of theory, has demonstrated the utter fallacy of the globulistic views; some of the members of the *Academie de Medecine* experienced, after repeated attempts, nothing but repeated failures. Andral tried it on 130 or 140 patients, in the presence of the Homœopathists themselves, yet in but a single case was he successful. The claims of imposture were unable to stand the searching test of science.

But we have a more serious charge to prefer against the supporters of the system, and one which we would in truth believe to be applicable only to a contemptible minority. When the sacred office of the pastor is debased by the introduction of the things of time and sense; when the inspired words of the Deity are invoked to sanctify the claims of a question purely scientific, the duty of the literary questor is then past; uncompromising rebuke is the only resource. We allude to a recent sermon preached with the direct object of explaining and substantiating by proof from holy writ the views of Homœopathy, and published in a medical journal of the day. We feel that the demands of our duty are satisfied by the mere notice of the subject; it is unnecessary to shock the feelings of our readers by delaying longer upon it.

The true means of resistance to the onward progress of Homœopathic and other absurdities are in the hands of the profession itself: ignorance of the laws of Physiology and Pathology clings like the gloomy mantle of night around the opening path of medical science. The existence in its ranks of men exercising its mysterious art, and wielding

* *Hahnemann's organs*; Dr. Guin's "*Pharmacopœia Homœopathica*," &c.

its weapons potent no less to destruction than to salvation, to whom its fundamental truths are as enigmatical as the riddles of the Sphinx, amply account for the rapid strides of sedition so recently manifested amongst its adherents. We firmly believe, that until the unclean thing is weeded out root and branch, and the cautery be applied to the affected parts, the contagion will spread, and gather as it goes. We may con-
 sider in the words of the most eminent physiological chemist* of our day, who writes: "How differently would the treatment of diseases be conducted if we had perfectly

* Liebig's "Letters on Chemistry," p. 13.

clear notions of the processes of digestion, assimilation, and secretion. Without just views of force, cause, and effect—without a clear view into the very essence of natural phenomena—without a solid physiological and chemical education, is it to be wondered at that men, in other respects rational, should defend the most absurd notions; that the doctrines of Hahnemann should prevail in Germany, and find disciples in all countries? Reason alone will not prevent whole nations from falling into the most abject superstitions; whilst even a child, whose mind has been duly developed and instructed, will repudiate the fear of ghosts and hobgoblins." VINCLUM.

History.

CAN THE APOSTOLIC ORIGIN AND NATIONAL INDEPENDENCE OF THE BRITISH CHURCH BE PROVED?

NEGATIVE ARTICLE.—I.

In choosing this side in the present discussion, we cannot be deemed guilty of acting from an impulse of bitterness or hostility against the English Church, because we love that communion, and our name is enrolled among its members. But those who know most of men and things, know how often it happens that great societies contain numerous individuals, who arrogate for their peculiar institution such proud titles and claims as would be instantly rejected by the more sober members. We rejoice, then, to have the opportunity to record our verdict against the proud assumption which many Churchmen have claimed for our beloved church. Nor are we deterred from recording our humble conviction by the remembrance that many great and good men have thought against us. No assumption can ever be substantiated by the number of men, however great, that may have supported it: if it were thus, then would all the lying devices of Romanism be established upon an unassailable foundation. The assumptions of societies, as well as those of individuals, must be taken to the one unerring test, that it may be proved whether they be legal or vain. When an individual

assumes kingly airs, his compeers ask him to show his credentials, and make known his antecedents. So is it with churches. When any one church arrogates to herself a proud pre-eminence above all kindred churches, she at once challenges all reflecting minds to inquire into the authority upon which she pretends to establish her claims. Thus has the harlot of Rome been hurled from the proud pinnacle of her mundane glory. Her besotted assumptions led inquiring minds to ask after her credentials; those credentials could not be found in the word of God, and they indignantly rejected that foul system of lies, and stamped Rome—"Babylon, the foredoomed of God."

The proud claims now put forward by High Churchmen lead us to inquire, where are the proofs that the English Church is the only apostolic church in this land. Comparisons are generally invidious, but when we find one set of professing Christians striving to unchristianize every professing sect who do not think with them, our duty—nay, our interest—requires that we should examine the proofs such men adduce to substantiate their assertions. We proceed, then, to notice a few of the most salient and most

frequently-adduced arguments brought forward by those who promulge these claims.

The bishops are a favourite pillar upon which this proud pretension rests. "See," say these men, "here are the veritable successors of the apostles, and how can our church be any other than apostolic?" But may not the Romanist use the same argument with the same effect? If bishops alone form a proof of apostolicity, then verily the Church of Rome is no apostate. But we must examine the bishops to find out if they are worthy of being called the apostles' successors. We are well aware, that individual abuse is no argument against a system; but a system may be examined to see if it bears the marks which justify its pretensions. Compare the English bishops and their pompous titles, their almost regal splendour, and the palaces they inhabit, with the estate of the twelve lowly men whom they profess to succeed. Or read the following, and then determine whether the English bishops give an apostolic essence to the British Church:—"The elders which are among you I exhort, who am also an elder, and a witness of the sufferings of Christ, and also a partaker of the glory that shall be revealed: feed the flock of God which is among you, taking the oversight thereof, not by constraint, but willingly; not for *filthy lucre*, but of a ready mind; neither as being *lords over God's heritage*, but being ensamples to the flock," 1 Pet. v. 1—3. Do the English bishops present this picture? Have they ever done so? Where, then, is this apostolic conduct? Must not a man have the spirit of Christ to be one of his? and must not a man have the spirit and power of an apostle to be apostolic?

Again, is there anything apostolic in beholding a bench of bishops filling the seats of a legislative hall? Is it following the pattern of him who determined to know nothing save Jesus and him crucified? Are these remarks made in an invidious spirit? They are not. We are now speaking of a system which is put forward by High Churchmen as a proof that their church is the only apostolic church in England. Our readers must determine whether such proof be *worthy of their reception*: for ourselves, we see as much apostolic proof in the lowly meeting-house, where no mitred-one ever

enters, but where the word and sacraments are duly ministered, as is to be found in the whole bench of bishops, with their appended palaces and gorgeous cathedrals. They, and they alone, are apostolic who worship that Jesus whom the apostles preached, and who draw their doctrine from the Book of Life.

Again, much stress is laid upon the interminable chain of bishops there has been in England; but the same argument is as good for Rome as for England. When were there no bishops in the Romish Church? And are we to believe that church to be apostolic because she can point to a line of bishops? Surely, surely, something more than a line of bishops is needed before we can account the horrors of the inquisition and the iniquities of the confessional holy and apostolic! The Church of Rome has her interminable chain of bishops, but she has, for ages, lost any claim to be called apostolic; consequently, a line of bishops does not impart an apostolic character—*ergo*, the English Church cannot found her claim upon her succession of bishops.

That the Church of England has no right to an exclusive title of apostolicity may be seen by her departure from apostolic usage. We are not going to determine whether the primitive Christians had bishops or not; of this we are certain—if they had, they were as unlike the bishops of the present day as two things can well be. But we shall show that, if they had bishops, our present system of creating bishops is altogether unapostolic. In the first chapter of Acts we find, that when the place of the traitor apostate had to be filled up by another apostle, he was not selected at the will of a few, but the whole church had the electing of the same: and this was ever the custom when a christian church assembled, until spiritual tyrants raised their head in the militant church of Christ. "In those early times, every christian church consisted of the people, their leaders, and the ministers and deacons; and these, indeed, belong essentially to every religious society. The people were, undoubtedly, the first in authority; for the apostles showed, by their own example, that nothing of moment was to be carried on or determined without the consent of the assembly,* and such a method of proceeding was both prudent and neces-

* Acts i. 15; vi. 3; xv. 4; xxi. 22.

sary in those critical times. *It was, therefore, the assembly of the people which chose their own rulers and teachers, or received them by a free and authoritative consent, when recommended by others.* The same people rejected or confirmed, by their suffrages, the laws that were proposed by their rulers to the assembly; excommunicated profligate and unworthy members of the church."—*Vide Mosheim, 1st Cent.* "A bishop, during the first and second centuries, was a person who had the care of one christian assembly, which, at that time, was, generally speaking, small enough to be contained in a private house. In this assembly he acted, not so much with the authority of a master, as with the zeal and diligence of a faithful servant."—*Mosheim, 1st Cent.* Such was the usage in the apostolic times. Compare the present practice of selecting bishops by the ruling authority, and the utter want of authority by the laity in the Church of England, with the usage of some of the sects, and determine which is nearest to the apostolic.

Some injudicious Churchmen fancy that their cathedral pomp, and their form of prayer, stamp their church with an apostolic impress; no words are needed to prove the fallacy of such an argument.

The way by which a cure of souls is obtained in the Church of England prevents her members from supposing that she is more apostolic than her neighbours. Can it be apostolic to purchase what is termed a living? Again, can it be apostolic that some christian ministers should have their thousands, and do but little work, while numbers of earnest, devoted men hardly receive a subsistence for their dependants? Would not the apostles scorn to have their names attached to any system which would allow such an unfair distribution of this world's wealth among a community of professed brethren? Verily, Churchman as I am, I blush to think that the sects are extremely more apostolic in this very essential thing.

Again, what is there apostolic in the prohibition which prevents episcopalian ministers from preaching in unconsecrated places of worship? What part of the writings of the apostles will warrant bishops in preventing godly ministers from preaching in a diocese because they do not hold all the opinions they consider orthodox?

But the Church of England is wrong in affirming that she can trace her descent from the apostles. High Churchmen are very bold in proclaiming that the Anglo Church is not an offshoot from Rome. Thus wrote Gresley:—"We have undoubted historical evidence of the existence of a pure branch of the church universal, governed by bishops, and possessing all the marks of a true church from the earliest time. If not founded by one of the apostles, still no doubt was ever entertained that the bishops of the ancient British Church derived their order from them in a regular manner. At the time of the Saxon invasion, the British Church was much oppressed; but when the Saxons themselves had been converted by the mission of Augustin, the two churches, that is to say, the ancient British and the Saxon, gradually coalesced into one, and, whether we trace the succession of our ministry through St. Augustin, who received his orders from the Gallican Church, or through the ancient British line, the fact of their being duly ordained and descended from the apostles, and so from Christ, is undeniable."* Here we see that this writer is obliged to trace the descent of the English Church from Rome: for it is a mere sophistry to speak of the British Church after she succumbed to Rome; when she submitted to receive the dogmas and rule of Rome, she at once threw aside her identity, and ignored her existence as an independent church. What, then, is the inference? Must we not see that our English Church is only a partially reformed church that sprung from the bowels of Rome? And can anything apostolic be born from the corruptions of Rome? It is sophistry to speak of descending from the British Church, when that church became lost in succumbing to Rome. With regard to what Gresley states concerning bishops, we refer to what we have stated above in refutation of his sophistries.

It is painful to hear mere tyros in theology, who have just received episcopal ordination, vaunting about their apostolical descent, and with their childish arguments striving to unchristianize those venerable men who, for a long series of years, under Dissenting banners, have been fighting the battles of the Lord, and have been instru-

mental in gathering in many souls to the fold of Christ. Many times have we blushed for the honour of our church to hear these boys prate. What has God done by the instrumentality of Churchmen that he has not done by the instrumentality of Dissenters? Have the islands of the sea been reclaimed from the night of dark superstition; Dissenters were instrumental in effecting the same. Where is there a herald of the cross, and the sects not represented there? Look on the right hand and on the left, to the north and to the south, and there you may see the blessing of God stamped as freely upon the labours of the Dissenter as upon those of the Churchman. Would this be so if Dissenters were not as apostolic as the Churchmen? Take away the bishops from the English Church, and a few non-essential rites and ceremonies, and what does she contain that is apostolic which christian Dissenters hold not? They have the word and the sacraments and an ordained ministry—ordained more in accordance with apostolic usage than the ministers of our own church. How vain, how childish, then, it is for Churchmen to arrogate to themselves titles and powers which are not warranted in

fact! When, oh! when, will all true Christians unweave the webs of sophistry which now divide them, and mingling in one harmonious whole, determine to drop all unmeaning and senseless shibboleths, and strive only to adorn and extend the dominion of Christ?

One word only is needful to show that the Church of England is not independent. Can that be free which is held in thrall by any other power? Acts of Parliament decide for the Church of England, and by those acts she cannot, of her own free will, amend or alter any of her laws. If her sons discover the symptoms of Popery in her constitution, they cannot at once get rid of the same, but they must wait until it pleases Queen, Lords, and Commons, to permit them to expunge the same. Hence, then, the Church of England is not free.

We have now brought our article to a conclusion; and if any can point out the fallacy of our argument, or the incorrectness of our statements, we shall thank them for their service. One thing we long to see, viz., truth triumphant, and error thrown down.

W. T.

AFFIRMATIVE ARTICLE.--I.

THIS question naturally admits of a two-fold division. We shall in this article consider the first part, viz.:—"The Apostolic Origin of the British Church." In order to simplify the subject, we shall endeavour to prove, first, *That the British Church was founded, not only during the lifetime of the Apostles, but by an Apostle or Apostles in person*; secondly, *That St. Paul was its founder*.*

First, some of the evidence that the British Church was of Apostolic Origin.

That it was the case is *highly probable*, from many considerations. First, from the very easy and frequent intercourse between Britain and Rome during the lifetime of the apostles; and secondly, and more especially, from the vast number, not only of Roman, but other foreigners, *trafficking* in Britain, *settled* in Britain, and *serving in the armies* of Britain.

Some few years after the subjugation of this island to the imperial sceptre, we find that there were so many foreigners in Britain, that in one year (A.D. 61) no less than 70,000 of them perished in an insurrection of the natives. At this time, too, so populous and rich a mart was London, that it is recorded of Seneca, the philosopher, that he amassed property in the island amounting in the lowest calculation to £300,000. At this period we learn from sacred and profane history, that Christianity spread "mightily abroad" in the world. At Rome there were zealous Christians, even in the *palace*; for St. Paul, writing from Rome to the Philippians (iv. 22), says, "All the saints salute you, chiefly they that are of Cæsar's household." That Christianity must have taken deep root in Rome is a natural inference. Heathen history tells us, that in the reign of Nero, about A.D. 64, when by public decrees search was made for the Christians, "Vast, indeed, was the multitude which was apprehended of that pernicious sect," as

* The writer is indebted to many works, but particularly to Foy's "English Church."

Tacitus and others called the Christians. Now, out of the numbers of Britons whom business or other causes would bring to Rome, can we suppose that *none* of them were converted to Christianity? Can we imagine, that out of the vast number of foreigners, not only from the west, but from the east, trading and settled in Britain, there were no professors of the "glad tidings of great joy?" Surely we cannot entertain the supposition. Again, if there were Christians in our island, is it not natural to suppose, that *some* of them would have zeal and courage enough to say a word for their Master, when they saw whole families, tribes, and provinces, given to the most shocking and revolting idolatries? The mind starts at the bare idea of a denial. Thus we see that there are strong probabilities in favour of the early introduction of Christianity into Britain. But we rest not on *probabilities*, however strong, or *opinions*, however prevalent.

Gildas, our earliest historian, who flourished in the beginning of the sixth century, has left on record the fact, "*That upon this our frozen isle, while shivering with the icy cold of ignorance, heathenism, and idolatry, the cheering beams of the true Sun—the Sun of Righteousness—shone brightly out, a little before, or about the time of, the defeat of Boadicea by the Roman legions.*"

Here, then, we have direct testimony as to the precise time of the foundation of the British Church. And it must not be forgotten, that at the time when the defeat occurred (A.D. 61), the apostles were in the midst of their evangelical career.

The testimony of Gildas is strongly confirmed by a statement of Justin Martyr, one of the earliest and most learned of the christian fathers. He declares that in his time (A.D. 140) Christianity was known in every country under the Roman sway. In Justin's time, and prior to it, Britain was a flourishing province of the Roman empire—it was filled with Roman legions, officers, and citizens—and it is quite incredible that such a writer as Justin Martyr, living at Rome, should use such strong and positive language, if there were not christian churches and christian services in Britain.

By whom the Church was founded in Britain?—We must mention at the onset, that all the fathers inform us, in general

terms, that it was the apostles *personally*. For example, Theodoret, bishop of Cyprus, says, "The apostles persuaded even the Britons to receive the laws of the crucified Lord." Again: "St. Paul, after his release from imprisonment at Rome, went straightway to Spain, and thence hastening away to other nations, carried the light of the gospel to them also." And that we may not mistake the "other nations," he adds, "That he (St. Paul), after having gone into Spain, brought salvation to the islands that lie in the ocean."

Theodoret knew of no other islands lying in the ocean than the British isles; indeed, this was their classical and geographical appellation. Eusebius, bishop of Cæsarea, the friend of our countryman, Constantine the Great, says that the apostles preached to "those called the *British islands*;" and Jerome, the most learned of the Latin fathers, says, "Paul preached the gospel in the *western parts*." Venantius, bishop of Poitiers, in the sixth century, says, "That he (Paul) crossed the ocean, and landed and preached in the countries which the Britons inhabit, and in the utmost Thule." And to mention but one authority more, which ought to set the matter completely at rest, Clement, bishop of Rome (who was St. Paul's friend, companion, and fellow-labourer), whose name (Phil. iv. 3) was written in the "Book of Life"—this same Clement says, "Paul taught righteousness to the whole world, and went even to the utmost bounds of the west." It should be remembered that the ancients knew nothing west of these islands, and hence from the time of their first discovery they were designated "*utmost*." Thus Virgil and Pliny, "*the utmost Thule*;" Catullus, "*the utmost island of the ocean*"—"the utmost Britons;" Horace, "*Britain, the utmost people of the world*;" and Venantius, as quoted above.

To these examples we might add many others, all and each of which would contribute their weight and testimony to the fact, that the British Church was of *Apostolic Origin*.

Secondly, *St. Paul was the founder of the British Church*.

We have seen, from the quotations made, that some say St. Paul proclaimed the gospel to the utmost bounds of the west, others naming Britain expressly; and it is an inter-

esting fact, that none held a contrary opinion on the subject for more than a thousand years. The witnesses who testify to its truth, commence with St. Paul's bosom friend, Clement, who could not be deceived in so plain a matter-of-fact—they speak of it with such confidence as shows that they had no suspicion of their being mistaken. *St. Paul*, then, if there be any truth in historic testimony, was the founder of the church of our early fathers.

To a truth thus demonstrated from history, little confirmation from the Bible will suffice. We turn, then, to the fifteenth chapter of the Epistle to the Romans, and we find the apostle expressing his *earnest desire and long-cherished purpose* of going from Rome into the *west*. "Whensoever," says he, "I take my journey into Spain, I will come to you."—"I will come by you into Spain." To this add the following remarkable and interesting facts:—St. Paul's release from prison at Rome agrees *exactly* with the time mentioned by Gildas when

Christianity was planted here. St. Paul was a contemporary prisoner with Bran, the father of Caractacus, and was released the *same* year. Between St. Paul's first and second imprisonment at Rome there was an interval of *eight years*. This interval, say the fathers, without one contrary opinion, "he passed in going up and down and preaching in the *western parts*." "Yea," says the Jesuit Capelli ("Lives of the Apostles"), "*this was the common and received opinion of all the fathers*."

Now, putting all these facts together—considering St. Paul's long-cherished wish and purpose, leisure time, and zeal—the opportunity he had of returning with the released captives, the celebrity of the island at the time, there would be ample ground to conclude, even though ancient writers were *silent*, that St. Paul did do what all antiquity asserted and believed—preached the gospel, not only in Spain, but also in these utmost bounds of the west—even *Britain*.

J. B.

Politics.

OUGHT THE JEWS TO BE ADMITTED TO PARLIAMENT?

AFFIRMATIVE ARTICLE.—I.

EIGHTEEN hundred years ago the Jewish nation, already shorn of its chief glories, severed by a single act the remaining bonds of its existence, and devoting to slaughter a portion of its people, surrendered the rest, with their unfortunate descendants, to long and universal oppression.

What they have since regained in part of the rights then lost has been wrung little by little from an unwilling world. Everywhere has the Jew been an outcast, and his claims held exceptive to the sacred law of justice. It is true, his frequent wealth has proved a most convenient resource when princes have had a fancy to be extravagant, but his liberty, his citizenship, his right to elect, or to act if elected,—these, the common gifts of God to all *men*, have been stubbornly denied, or if *acknowledged*, conceded only as the gradual *dawn of intelligence and reason* has necessi-

tated restitution. This policy of reducing the Jew to the moral leper of society and a mere cypher in the state, was not demanded by any excess of natural depravity, or by any disqualification arising from natural incapacity. The worst enemies of the Jew have not exhibited their own inferiority by asserting his. Philosophy and facts would have laughed the libel to scorn. Why, then, since he possesses equally with other men the dignity and capabilities of manhood, has he been cut off from its rightful honours? Why is it, that even now, when knowledge is every one's pretension, and freedom is lauded to the skies, that the question as to whether the Jew shall be admitted to civil rights, should remain as a question at all?

This is obviously the inquiry which Reason would make, were the matter left within her jurisdiction, as it ought to be. She

would point out that it would be about as proper and as clever a proceeding to discuss a Jew's claim to the sunlight as to other rights which are his in virtue of a common humanity. The fact is, our business lies not so much in demonstrating a truth as in dissipating objections to it. The right bears its own proof, and our position with respect to it is, that we deal chiefly with the *pretexts* upon which it is withheld. There is really no question till we get at these.

There can be no doubt but that the primary and chief objection to the Jew enjoying the full exercise of civil rights is, that *he is a Jew*—his very name full of associations evoking to Gentile feelings, rather than from any apprehension of the mischief he might do. We speak not here of bigotry in its worst forms, of persecution irrespective of principle, indifferent whether its victim be Jew, Methodist, or Mormonite; it is alike unworthy of attention and inaccessible to reason: but we refer to the practice of those persons who, like him of Tarsus, imagine they thus "do God service." These frown upon the Jew, deny him approach, shut him out from their assemblies, from a sense of duty. "Because," say they, "he is a Jew, we deem it right that he should be subjected to a particular kind of treatment. The ban of the Almighty is upon him, far be from us the arrogance which would nullify His decrees. God's plan determines ours. As nothing can be more evident than the fact that God is scourging the Jew, so nothing is clearer to us than the necessity that the punishment should be borne without human alleviation. The prophetic declaration, that he shall be 'a bye-word among all nations,' is a sufficient guide to our duty; and that while we serve our God the Jew can bring against us no charge of injustice, is manifested by his own engagement, pledging himself and his children to the chances of divine retribution."

It is an easy matter to show how erroneous is the assumption at the foundation of this doctrine. These persons assume what many of their forefathers, unfortunately for the world and Christianity, have assumed before them, that the judgments of God are in their keeping, and disposable at their pleasure. They emulate the angels, and, self-invested with the *powers of ministering spirits*, "deal damnation" around them in

the true satisfaction of duty-doing. For theirs is not a mere passive acquiescence, a leaving God to his own purposes and providences. Every denial of justice to the Jew is active in its character; every refusal of the right a perpetration of the wrong; every perpetuation of opinions, laws, tests, which obstruct the Jew in his attempts to attain to emancipation, is practically placing a barrier in the way of success, and must be regarded as a real and accountable act, since to perpetuate an evil that has come into our possession, and which we can extinguish if we choose, is just equivalent to creating it. Now, the error these people make in their treatment of the Jew is so apparent that it scarcely needs enlarging upon. Because, to carry out God's designs it is necessary they should know them, and then that they should possess authority to fulfil them. To know them, they must either have done what the mightiest angel whose powers they wield has never accomplished, unloosed the book of God's decrees, and made the Eternal mind their own, or they must have received a special revelation. The former of these means they will not pretend to, the latter they cannot, with any advantage to themselves. They will, indeed, reiterate the denunciations of holy writ; again and again will prophecy be on their lip, and be, with its long and terrible fulfilment, adduced as indicative of the divine will; but, even then, allowing, as we must, that the scourge was intended, whence comes *their authority* to administer it? Does this come with the prophecy? This is the important point. Has God left his prophecies in the hands of men, to be construed and consummated as custom, or caprice, or imbecility, may judge, or misjudge, of occasion; or, has he not rather reserved to himself the infliction of vengeance, sometimes using men, indeed, as instruments, unconscious instruments, in the execution of his judgments, at the same time justly requiring their *exclusive obedience* to certain laws which he has instituted for their mutual good? This is, undoubtedly, God's plan. He would have us keep his commandments, and not meddle with his judgments, therefore are we told that "*secret things belong to the Lord our God, but they that are revealed to us and to our children.*" He would have us "*do justice and love mercy,*" and has summed

up into one rule the *whole* duty of men to each other. Specifically has he warned the Gentiles to "boast not against the branches." How mistaken, then, the supposition which some of them cherish with so much satisfaction to themselves, that they are the faithful stewards of Omnipotence! They have misunderstood the nature of their Master's service, the terms of his commission. They have gone to prophecy, searching for precepts, when the keeping of precepts which there could be no misunderstanding about, was all the assistance that God had permitted in the accomplishment of prophecy. Their error arrives at palpable absurdity. They have actually been the creators of those very providences and judgments which they disavow interference with! *Non-intervention* in reference to God's decrees is their favourite boast; but when their application of the good principle undergoes our scrutiny, we find that God's decrees have been supplanted by Gentile intolerance, which reverence for the Almighty and the religion he has inculcated, demands that we denounce as characterized as much by impiety as it is by injustice.

Unless the treatment of the Jew be the result of the most contemptible ignorance, or, what is worse, of the vilest dispositions of human nature,—a supposition we should be sorry to entertain, inasmuch as it would be paying but a poor compliment to our opponents,—we are bound to believe that a great proportion of their opposition to the Jew is comprehended in, or is traceable to, the foregoing objection. It would, however, be unfair to insist that it has universal influence. To any of our opponents who demand it, we will readily accede acquittal, and supposing them to be free from any intention that their conduct should operate as a punishment to the Jew, we will take their own objection. The plea upon which they deny senatorial rights to the Jew is, that he would *unchristianize the senate*. They are jealous for its christian purity, for it is the element of preservativeness. Unluckily for them, the "salt has lost its savour." Coppock,—illustrious practitioner in parliamentary ethics!—what say you of the saintly purity of the English Commons? "I could *take a list* of the English boroughs, beginning with Abingdon, and ending with the last letter, and could put opposite—the

member paid so much for his seat. I state this to show *what the system is*." Mr. Coppock may have overrated his ability; he might fail in proving that every member has stooped to infamy like that of St. Albans; but he has disclosed enough to show a failing more general even than was suspected. Now, bribery and corruption are acts committed by the *member-elect*; they are not, like infidelity and private immorality, the faults of his private character, but are strictly acts of a capacity he is entering upon. Where, then, is the entirety of that christian character which is demanded for the house? It would, indeed, be the queerest sleight in the process of conversion ever heard of, if these men could be made collectively what they are not individually. Homogeneousness is the same in its particles. There is no such special talisman for the change of vicious elements into a virtuous whole. The christian oath which members take no more makes them Christians than do their christian names. But supposing this house were Christians, *i.e.*, that all its members were influenced by christian principles, how could the admission of a Jew affect its character injuriously? Christianity and Judaism are identical in all that concerns the purpose of a government. The rules which regulate the actions of men towards each other are the same in the Old Testament as in the New. It must be remembered, that the purpose of government is not the propagation of the christian religion, but *the enforcement of relative duties*, and these are taught by precepts which have descended unaltered from Jew to Christian, and which both have an equal interest in obeying. The use of the phrase "unchristianize," in the sense it is made use of in this question, is a mere trick. It means the violation, the overthrow of just principles; but a sufficient refutation of every such insinuation is the fidelity with which the Jews now discharge important public functions.

We have thus considered the objections of those who negative the inquiry, "Ought the Jews to be admitted to Parliament?" Trite enough, we may be told, our remarks are; but we ask in return, *Why* prolong so trite a question? Viewed apart from considerations of equity, as a matter depending upon *the representative arrangement*, it is a settled question. London and Greenwich has each

chosen a representative from the Jewish race. This is at once a final decision, else is our pet system of representation a sham. The Commons themselves have ratified this decision. And if two of the most enlightened constituencies of this nation, and the "collective wisdom of the empire," agree as touching the Jew's admission, shall the accidental terms of an oath, or an adverse vote of the Lords, be sufficient to keep him "below the bar?" Assuredly not. The generation which has so far cast off its ancient

prejudices as to hold out the hand of friendship to all the world, which sends through its electric wires its greeting to France; the enlightenment and love of freedom which have welcomed Kossuth, and raised Rothschild and Salomons to share in the honours as they do in the burdens of the state, will be deterred by no obstacles from securing for Rothschild and Salomons, and as many of their brethren as may be similarly chosen, a speedy and a free exercise of their parliamentary functions.

B. W. P.

NEGATIVE ARTICLE.—I.

THE admission of the Jew into the British House of Commons is fraught with many difficulties, and involves several very serious questions, not only of a civil and political, but also constitutional and religious, nature. Indeed, the mere attempt at such an innovation is one which threatens to separate the church from the state; to infringe upon, if not destroy, the independence of the democratic part of the British constitution; and as well to bend the necks of free-born Englishmen to the rule of those who are entirely different from them, and who openly and avowedly treat the Great Head of their church as an impostor, holding up to ridicule the faith of the nation. The subject is, therefore, one which may not be stated lightly; it requires to be looked at in all its bearings and consequences. It demands the most serious consideration from those whose office it is to decide this important question, and as well of all who have any interest in the weal of this nation, and any influence left for her constitution, or gratified for the amount of freedom and happiness enjoyed by her inhabitants. The leading questions, therefore, which would suggest themselves to the mind of a thinking man, are—1st. What is the nature of the British Constitution? 2nd. What is the Parliament House of Commons? 3rd. Is the Commons House independent of, or subservient to, the Constitution? A due investigation and consideration of these several questions may throw a little light upon the subject, and tend in some measure to assist in the final conclusion to be arrived at.

These several questions we will now consider in order.

1. The constitution of England is

"Christian;" based upon Christianity; subservient to the laws of Christ; and holds as its fundamental creed the doctrine that Jesus Christ is the Son of God, and God as well as Man. It is also composed, 1st, of a Monarch, who is bound to be a Christian; 2ndly, Lords *Spiritual* and Temporal, selected for their piety, their birth, their wisdom, their valour, or their property; and 3rdly, Commons, freely chosen by the people *from among themselves*, all of whom were originally obliged not only to be Christians, but also communicants in the Church of England. Such a constitution (unlike that of any other country), being neither entirely monarchical, aristocratical, nor democratic, secures the benefit of all, without infringing upon or destroying the independence of either. The three powers being brought to bear upon each other, operate as a check one upon another, and produce that liberty and happiness so fully enjoyed by the inhabitants of this land, preventing all the direful consequences which result from power resting solely on one class, which is so severely felt by other nations, both in the destruction of their liberties and rights as men on the one hand, or in licentiousness, innovation, and want of stability on the other. Touching the infringement upon the character or position of either of these three powers, Mr. Justice Blackstone very wisely says, "If it should ever happen that the independence of any one of the three should be lost, or that it should become subservient to the views of either of the other two, there would soon be an end of our constitution. The legislature would be changed from that which (upon the supposition of an original contract, either actual or implied) is presumed to have been

originally set up by the general consent and fundamental act of the society;" and such a change, however effected, would, according to Locke, "at once effect an entire dissolution of the bands of government, and the people would thereby be reduced to a state of anarchy, with liberty to constitute to themselves a new legislative power."

2nd. The House of Commons, as before stated, is composed of persons freely chosen by the people from among themselves, and represents the democratical part of our constitution. This proposition viewed simply, would seem to imply that the Jew, being now in some sense a natural-born subject, has a right to be chosen, and also to represent a constituency. This will, however, be met by a consideration of the next question, viz.:—

3rd. Is the House of Commons independent of, or subservient to, the Constitution?

There can be no doubt that every integral part must necessarily be dependent on and subservient to the whole. The democratical part of the British constitution must, therefore, be considered as a part of, and still dependent on, and in some sense subservient to, the constitution of the country: and as that constitution is Christian, and acknowledges Christ to be the supreme Head of the church, there can be but little room for argument to show that it is not right either for the people, who are bound themselves to be of the same creed, and in subjection to Christ's laws, to elect a Jew, or for a Jew when elected (if elected he can be considered, the people's call being to elect *one of themselves*) to represent not only those who seem to desire to bend the neck of this country to

the yoke of another people, but also the faithful and liege subjects of the gospel of Jesus Christ. Besides, look at the Jew himself. Who is he? Can he be considered by Christians as one of themselves? It is true, according to the law of this country, that he is in some sort a natural-born subject, but his own creed compels him to believe himself to be driven from his own land, and doomed to wander as a stranger in the lands of other nations as a punishment for his sin; and we as Christians are led to believe that very sin to be the rejection of Jesus Christ as the Son of God and Saviour of the world; and if he is consistent with his own creed, he is daily expecting to be called back to his own land, where, and where alone, he has any right to expect to be placed in a position of rule. The admission of the Jew, therefore, into the senate-house of this kingdom, where he would be called upon not to administer but to legislate christian laws for a christian people, and those even for the regulation of the church, while he himself at the same time denies Christ altogether, appears inconsistent both with the constitution of England and every rule of common sense, unless indeed it be wished, in the words of Locke, "to effect at once an entire dissolution of the bands of government, and reduce the people to anarchy." No; the Jew must be considered as a stranger within our gates, although we may still offer for him and ourselves the prayer of the poet:—

"May England still maintain her own position
free,
And Israel's home his own dear Canaan be."

VERITAS.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—I.

WHENEVER civilization has become sufficiently developed to call into existence the reflective powers of the mind, there seems to *have sprung up alongside of it a strong belief that, whatever the then state of social happiness, there was to be attained a*

much higher gradation of earthly bliss—a state so far in advance of that then present, as to be worthy of the greatest human exertions for its attainment. The existence of such a belief is not to be ascribed to any mania, which, as in some cases, having been

ated with some peculiar sect, has con-
l rife, perhaps, for generations, but at
has died away, and is heard of no

Philosophers, statesmen, and poets,
like proclaimed this belief, and lent
names to its advocacy, while the pre-
age in this is equally believing with
ist, and perhaps even more so.

might afford some satisfaction to the
is if we were to trace the origin of this
ative belief. The task, however, would
an easy one, and, moreover, it is not
ial to our present inquiry. Suffice it,
ore, to say, that some have referred it
n's knowledge of his own deficiencies,
is consciousness that perfection, or any-
approaching to it, can only be attained
uch perseverance and longsuffering.
s have considered it as resulting from
peration of a principle of *hope* ind-
d within us.

*visions Hope! in thy sweet garden grow
hs for each toil, a charm for every woe;
y their sweets, in Nature's languid hour,
ay-worn pilgrim seeks thy summer bower;
as the wild bee murmurs on the wing,
peaceful dreams thy handmaid spirits bring!
viewless forms th' Æolian organ play,
weep the furrow'd lines of anxious thought
f."*

we ventured an opinion of our own
this subject, we should say that this
ing after more perfect happiness has
implanted within man by his all-wise
or as a means of urging him on in that
ensive scale of improvement which is
rate and ennoble his nature, and ulti-
y prepare him for those high destinies
await him.

e theories laid down for the realization
s state of "terrestrial paradise"—so
desired alike by peasant and prince—
of course, been various as they have
been numerous. Speaking of them
ally, as they range from the "Republic"
atlantis" of Plato, to the "Utopia" of
omas More, and from thence to the
ia" and "El Dorado" schemes of the
it day, they have all been "communis-
n their tendency. To constitute man-
into one common family, with common
privileges, and property, has been
ward as the first object to be accom-
d. Having reduced all to such "com-
level," they might proceed to the for-

mation and maintenance of their social fabric,
by any of the means which the ingenuity of
the propounders of these schemes has pro-
duced in abundance.

Now it cannot be denied that there is
something pleasing—yea, even enchanting—
in the idea of a community of people all
actuated by one common feeling, and that
the promotion of each other's happiness! The
poet has found in this idea a rich theme for
his poetry:—

"O happy they, the happiest of their kind,
Whom social laws unite, and in one fate
Their hearts, their fortunes, and their beings
blend."

The philosopher, after lamenting the evils
of the past, may well have been captivated
by a theory so fair and so pleasing. Or
the statesman, stepping aside from his
legislative enactments for the suppression
of vice and the promotion of virtue, might
exclaim, "My energies are no longer re-
quired; the work of my life is superseded by
the single idea, 'Let men dwell together in
unity and love;' henceforward I rest from my
labours." We admit that we have been
sometimes absorbed and led from our accus-
tomed track while contemplating such "fairy
scenes." Our imagination has, on such
occasions, carried us to some modern "Cape
Colony," where, beneath a clear blue sky,
amid rippling fountains and sylvan bowers,
dwell a people amidst whom the seeds of
discord and social strife never yet found
shelter—whose only emblems are the "dove"
and the "lamb"—whose former toils for an
existence are now changed into a "labour of
love," and who sing, with gladsome hearts,
"Glory to God in the highest, and on earth
peace, good will toward men." Such, we say,
have sometimes been the workings of our
fancy: but, alas! how soon have our "golden
dreams" been followed by glimpses of
"waking realities!" Alas! that we should
delude ourselves with hopes which can never
be realized!

But that we may come to a more practical
understanding of the subject, we purpose
briefly to notice some of the most prominent
communistic theories which have been pro-
pounded or experimented upon. We must
here make some distinction between those
who have "theorized" only and those who
have sought the practical embodiment of

their principles. In speaking of the theorists, first we may mention Plato, whose work, entitled the "Atlantis," we have before referred to; Sir Thomas More, the writer of "Utopia," a book widely known to fame, and one which should be read by every student of social progression; Lord Bacon, author of the "New Atlantis;" Harrington, author of "Oceana;" Campanella, a Calabrian friar, who wrote the "City of the Sun," which has been appropriately described "a fantastic creation full of grandeur;" Hall, author of the "Other World;" Fénelon, author of "Isle of Pleasures;" the Abbé St. Pierre, and his "Dream of Perpetual Peace;" and Morelly, author of "Basiliade," "Code of Nature," &c. Coleridge, also, in his early days, in conjunction with several of his contemporaries, was enthusiastic in his millennial scheme, "Pantisocracy," which, however, was never reduced to practice; while Southey, and Shelley in their poetical works embody frequent dreamings of social Utopias; some of those of Shelley being exceedingly resplendent with beautiful and captivating ideas. The Greek poets, also, by their frequent allusions to the "Golden Age," seem to have indulged themselves in dreamings of a like nature. The celebrated Mr. Robert Owen, some years since, attracted attention to the communistic question by the publication of his "New Moral World;" while the most popular advocate of the system in the present day is the young and talented Goodwin Barmby, who, in 1843, founded the Communist Church; and about the same time commenced publishing his "Book of Platopolis," a work (whatever else may be said against it) manifesting considerable learning and a refined taste. In France, of late days, communistic theories have sprung up almost "as thick as mushrooms" (pardon the homely phrase!), to which some of them may be not inaptly compared. The most popular advocates there are M. Cabet (author of "Travels in Icaria"), the Abbé Constant, and M. Proudhon. Louis Blanc, we suspect, belongs to the same school, only that he endeavours to apply his principles in more practical directions than some of his contemporaries, although his efforts have, at present, proved futile.

We make this lengthy allusion to the foregoing writers with a twofold object:—*First, that our readers may be induced to*

turn to their works which may be within reach, in order to read and judge for themselves; secondly, that our opponents may not charge us with judging of all from an acquaintance with one or two. Speaking, then, generally of those we have enumerated, we hesitate not to say that, however noble may have been the sentiments with which they were actuated, their theories and their principles are far too *unpractical* to be ever really useful in the promotion of men's happiness. It is pleasing to the fancy to picture the domestic felicity which might surround the inhabitants of some far remote "Arcadia," with "its sunny skies, its blue hills, its cascades, and its shepherdesses;" but if the happiness of man is to be permanently increased, it must be by something more practical in its principles. Those blessed with affluence can rear up for themselves "model Arcadias" and "halls of harmony" in abundance. But it is for the toiling millions, the masses of mankind, those whose only wealth is in the power of their arms to labour, that we should endeavour to provide new sources of social comfort; and it is to the test of their application to this class that all schemes professing to increase the happiness of mankind must be sooner or later submitted. God has decreed, yea, has engraven upon the forehead of his people, that "in the sweat of thy brow shalt thou eat bread;" and until he shall revoke this decree, it will be worse than madness to expect success for any scheme which does not fully recognise its fulfilment.

We suspect that by this time some of our readers will begin to charge us with confining our attention to Communism in theory. In order, then, to escape from this charge, we mean briefly to glance at the various communistic societies which have endeavoured to reduce their principles to practice; or which, without having any clearly defined principles to guide them, have tried the plan of communistic residences. The first society of this sort of which history gives any details, appear to be the "Essenes," a sect of Jews. Josephus informs us, that in his time they numbered almost 4,000. They were chiefly engaged in agriculture, and had no particular town, but were scattered in groups through the principal parts of Judea. In this latter respect they differ from subsequent communistic bodies. They seem to

have paid great regard to religious ordinances, and to have looked upon all men as free and equal. We do not read that they made any great progress. Shortly before the English Reformation, the Anabaptists embraced the doctrine of the community of goods, the common family, and other communistic principles; and still earlier, some of the disciples of Wickliffe, Luther, and John Huss, imbibed similar notions, and quoted apparently high authority for so doing. Next we have mention of the Moravians and the Shakers, or, as they were sometimes called, the United Brethren and the United Society of Believers. These seem to have been the most successful of all sects of communistic adventurers. Sections of the Moravians are still to be found in Southern Asia and other parts of Europe. The Shakers have chiefly settled down in America. They both adopt the principle of common rights, and educate their children in common. They do not, however, recognise the community of women; and the Moravians pay strict attention to marriage. The Shakers, however, by their religious sentiments, are restrained from marriage, and keep up their numbers by adopted children. For the most part they are exceedingly illiterate in all but religious matters; indeed the Shakers seem to have not the slightest desire for mental cultivation. It is only within the last century that they have established the community of property; and this feature seems to have succeeded with them. In 1805 they had twenty communities; in 1847 there were seventeen, but their entire population was then estimated at only between 4,000 and 5,000. America seems a favoured spot for Utopian experimenters: in addition to the Shakers, there are sects of Harmonists, Economists, and Fraternalists. Each of these are of German origin, and by hard plodding and hard living have acquired some property, but their numbers seem in no way likely to increase. They each have religious views peculiar to themselves.

The most popular, however, of all modern socialistic sects is that founded by St. Simon, the French philosopher. The originality of his political as well as his religious views attracted considerable attention, and great exertions were made to bring the scheme before the public. Numbers of workmen

enrolled themselves as his followers, and worked at their respective occupations in special houses; "but the doctrine had no substantial hold upon their minds, and the promised amelioration came not." Next to this was the scheme organized by Fourier, another French philosopher, which was preferred by many to that of St. Simon, because the views of Fourier were more moderated. Very extensive experiments were made upon this principle, both in France and America, but in most instances they have proved an entire failure.

But to come nearer home. In 1841, a community, under the direction of Mr. Robert Owen, commenced communistic operations in Hampshire. They located themselves upon 1,200 acres of land, and had a building called "Harmony Hall." Some £30,000 was expended in the experiment, and the establishment was fitted up with every regard to convenience, utility, and even elegance, where it could be had without sacrifice of the former. The community consisted of fifty or sixty persons only, and these disagreeing on some point relative to the management of their offices, and being pressed with pecuniary difficulties, the community struggled on for a time in anything but a prosperous state, and in July, 1845, became bankrupts, and all the property was sold, the occupants of course being again thrown upon their own resources.

In 1842 the Concordists established a communitive association, under the name of the Concordium, at Ham, in Surrey. The adherents never became numerous, and the community was dissolved in two or three years afterwards.—(*Vide Chambers' Papers for the People*, No. 18.)

We have now seen that in practice Communism has proved what we stated of it in theory—too *visionary* to be productive of really beneficial results. Where it has met with any success, it has been by the hard plodding of its adherents, and by their *remaining in ignorance*, which circumstances must necessarily detract from their happiness.

We have investigated the present question, not with the eye of a sceptic, but as those who would rejoice to be able to discover any plan for the amelioration of man's social condition, and who would earnestly seek to hasten the time when

"No sigh, no murmur, the wide world shall hear:
From every face be wiped off every tear.

Peace o'er the world her olive wand extend,
And white-robed Innocence from heaven
descend.

When discord, strife, and enmity shall cease,
And man meet man in amity and peace."

The conclusion at which we have arrived on this subject may be thus summed up:—

1st. That Communism, in theory, has never shown itself adequate to meet the wants of, and promote the happiness of, man.

2nd. That in practice it has proved a failure, as shown in the many attempts

which have been made under various names and circumstances, nearly all of which have been productive of disappointment and misery.

3rd. That from man's nature it is impossible for him long to remain happy in a state of Communism, unless imbued with a high sense of moral and religious rectitude, in which case he would be happy without resorting to this alternative; and, indeed, under such circumstances would be very unlikely to resign himself to such a state.

Our arguments on this last point we may present in a future paper, and in the meantime leave the whole question in the hands of our readers.

C. W., Jun.

AFFIRMATIVE ARTICLE.—I.

BEFORE entering upon the question in hand, it may be well to define the principal term used in it, lest we should be found sustaining one thing while our opponents are engaged in battling with another.

By "Communism" we understand that principle which would render common property to the entire human family the earth and all things which from time to time are produced from it, whether they be animal, vegetable, or mineral, and which would, at the same time, render the production of them common.

Communism, then, on the one hand, enjoins all to labour; while, on the other, it maintains that those who labour ought to be permitted to eat. Its texts are, "In all labour there is profit;" "He that will not labour, neither shall he eat."

In attempting to maintain the affirmative of the question at the head of this article we shall endeavour to show:—

1st. That the earth, and all that is produced from it by the labour of man, ought to be common property.

2nd. That every able-bodied man ought to perform his share of labour.

3rd. That a community of labour, and its results, would be for the happiness of mankind in general.

We say the earth ought to be regarded as common property, and for this reason:—No man can establish and maintain an equitable right in any portion of the earth. "For if one portion of the earth's surface may justly become the property of an individual,

then other portions of the earth's surface may be so held; and, eventually, the whole earth's surface may be so held, and our planet may altogether lapse into private hands. Observe, now, the dilemma to which this leads. Supposing the entire habitable globe to be so enclosed, it follows, that if the landowners have a valid right to its surface, all who are not landowners have no right at all to its surface. Hence such can exist on the earth by sufferance only. They are all trespassers. Save by the permission of the lords of the soil, they can have no room for the soles of their feet. Nay, should the others think fit to deny them a resting-place, these landless men might equitably be expelled from the earth altogether! If, then, the assumption that land can be held as property involves that the whole globe may become the private domain of a part of its inhabitants; and if, then, by consequence the rest of its inhabitants can exercise their faculties, can exist even, only by consent of the landowners, it is manifest that an exclusive possession of the soil necessitates an infringement of the law of equal freedom. For men who cannot live, and move, and have their being without the leave of others, cannot be equally free with those others."—*Social Statics*, by Herbert Spencer.

But let us take another view of this private right in the soil; and it will be found equally indefensible. God made the earth. It has been given for the use of man. As raw material, then, it contains in itself an intrinsic value, for in it are contained all the

wealth. But men, by appropriating to their individual use, appropriate value which it intrinsically contains; that value was stamped upon it by the maker of it; and being the work of an individual, but of the race, it is the property of the persons who appropriate it for their own use, and demand compensation for the intrinsic value of their fellow-men of that which was designed for their use.

Not only has man asserted the right of dominion to the earth, but also to the products produced from it by the labour of man. Some men, in their labours, discover truths which are of the greatest importance to society at the present time, by the development of which the world is destined to be blessed to the end of time. These truths are, for the most part, of such a nature, that, if applied to the benefit of the world, they cannot permanently be kept secret. It is proved at once that they were discovered for the world, and not for the benefit of any solitary individual. Many of the mechanical truths have been discovered by various men at different times. These, however, have not been rendered the property of the discoverers for a long time, in order that they might be made available for the labour and expense of perfecting the discovery; and the considerable loss to the community which would be deterred, for the more time in which the truth until the end of time, owing to the rent which is called upon to pay for it to the holder in the form of enhanced price.

It is maintained that the mere discovery of a truth no more renders that truth the property of the person discovering it than the discovery of a planet renders it the property of the astronomer. The very fact that it is impossible for the discoverer to claim the exclusive benefit of the truth he discovers, shows that it belongs to the world; and it is not private property.

It may be asked, Ought not the discoverer of a new truth in science which is destined to bless the world to the end of time to be rewarded for his discovery? Undoubtedly he ought; and in a state he would be, by reaping, in

common with others, the advantages of others' discoveries and of others' labours. This, however, is a very different matter from claiming an absolute and exclusive right in the discovery which he has made. Columbus might justly claim to be rewarded by the parties who were benefited by his discovery, but certainly Columbus had no right to claim America as his own. The truth, like the continent, was God's work; and, as such, was designed for the race. The discovery was the reward of the man, "and the labourer is worthy of his wages." What we maintain is, that it is not proper for the individual to concentrate in himself advantages which were designed for the race. If it is not in accordance with the rules of equity for a man to reserve to his own exclusive aggrandizement a principle which, probably, after immense labour, he may have discovered, it can hardly be considered as consonant with justice that a person who has rendered no service whatever to society, and whose only recommendation is that his father or grandfather managed, by fair means or by foul, to save a large sum of money, the result of the labour of himself or of those about him, should be permitted to live from year to year on the proceeds of the labours of his fellow-men, without doing anything to add directly or indirectly to the common stock, or in any way making a return to the community for what he has received. True, it may be said, "he lives upon the interest of his money;" and "money," it is said, "begets money." We grant it, money does beget money; and in the present state of society it seems needful that it should do so. As, however, we are talking about a state which involves a radical change in society, it is but natural to inquire, Ought mere money to beget money?

What is money? Money is wealth, or its representative. How comes a large quantity of money in the hands of a single person? If he has come by it honestly, he has received it in exchange for services rendered to society, either by himself or by some of his progenitors. If dishonestly, he has merely cheated the public out of what ought to have been the reward of service. We will suppose the first to have been the case; then the question naturally comes, Was the service which he rendered to society finite or

infinite? For if the service was finite, the reward should be finite; if infinite, the reward should be infinite. But the reward in the present case is infinite; the man was rewarded in his lifetime. Suppose the services were rendered by a progenitor, he lived, and lived at the expense of the public in exchange for his services: but he is dead, and now the reward has devolved upon his children, and may be continued to the thousandth generation. There is no limit as to time; hence we say the reward is infinite: but was the service infinite? It may justly be questioned whether any service which man can render to his fellow-man is infinite. As it regards the mass of those services which one man renders to another, we think it must be conceded that they are not infinite. Here is one man who furnishes the ladies with an article of dress or ornament; another supplies people with good tea; another furnishes smokers with tobacco, &c.; it certainly cannot be said of any mere merchant or shopkeeper that he renders the public an infinite service, a service which merits luxury and enjoyment for himself as long as he lives, and for his sons through endless generations after he is dead; and yet it is to these classes of persons that, for the more part, belong the men of capital throughout the land. It is from these sources that large portions of capital have been derived, as far as individuals are concerned.

If, then, capital, like the soil and discoveries, can be shown, as above, not to be private property, i. e., according to equity, it follows that labour, too, ought to be common property. For what is capital but accumulated labour? Nay, the very fact that the truths in science which from time to time are discovered, are designed to be the property of mankind generally, when taken in connexion with the circumstance that the discovery of these truths is generally the result of immense labour, is sufficient to show that mankind are called upon mutually to aid each other. For if the scientific man is required to sacrifice the result of his labours for the benefit of men in general, it is but reasonable to suppose that men in general ought to make some return for the *boon conferred*.

2nd. Every man who is able to work ought to perform his share of labour.

Suppose there were no rich men and no poor men, as would be the case if all men laboured for, and partook of, one common stock, it is evident that one member of the community would be as much bound to labour as another, for none would be regarded as having anything that he could properly call his own, all would belong to the community; and if none worked, all must suffer want.

But even irrespective of a communistic state, this truth, that all men who are able ought to labour, appears to be written upon man's nature. Man's health and happiness are bound up with labour; hence we find that many of those persons who are too rich, or too proud, to engage in any useful employment, engage in employments which are not useful; such as hunting, shooting, riding, &c.; while those who refrain from such exercises scarcely know what it is to enjoy good health.

3rd. A community of labour and its results would promote the happiness of mankind in general. The rich *must* labour; why not, then, be engaged in some work which would be for the good of the community—something which would make the world richer? Surely it would be far better for rich men themselves if they were from time to time engaged in doing something useful rather than in merely consuming wealth and murdering time.

The poor *must* labour; he knows it; he is oftentimes oppressed with it; it would be a blessing to him to be rid of a little of it, only that unfortunately he does not know how to spare a single stiver of the small pittance which he receives in return. There is no question, then, that the passing of a portion of his load to the back of his more able friend would to him be a real blessing.

But a community of the results of labour would be for the happiness of mankind generally.

Suppose that a wealthy man were secure from want, which he would be in a communistic state, it would be in many cases a real blessing to be freed from the anxiety which his wealth entails. The cure, the corroding agitation, which attend the possession of wealth, are oftentimes as great, if not greater, than that of its collection. How is it to be invested so as to yield most, and at the same time be secure? Who is to be

trasted with the investing of it ? And, after it has been invested, the rate of interest which it produces, are questions which are for ever agitating the mind. And then, after a while, the rich man, as well as the poor one, has to die, and whatever may be the nature of his prospects for another state of existence, he must first dispose of his property, or even his own children will curse him when he is gone. A lawyer is called in, and perhaps the last thought which passes through the poor wretch's mind while standing on the confines of a state in which his single interests are of more importance than the merely temporal interests of all the world besides, is one of pounds, shillings, and pence. How happy is the death of him who has nought to leave behind compared with this ! Communism, however, would entirely dispense with such scenes, for the very good reason that no one would have aught to leave. We need not say that the change would improve the condition of the poor man : instead of an empty cupboard, he would have enough, with the only condition of doing his share of labour : and when either too ill or too old for this, he would be assured of a comfortable and ungrudging maintenance from the common store. How different would be the position of the producers of wealth under such circumstances from their position at present !

But Communism would be advantageous to all, inasmuch as there would be no object to answer by mere selfishness. Selfishness would, to a considerable extent, cease

to exist, or be held in abeyance ; and with it a vast number of those crimes which it has been the fertile source of from the earliest period. The powers, both of body and mind, which men possess would be more fully developed. Instead of children being sent into the field to labour at an age as early as possible, they would be placed under the care of suitable teachers, and well educated ; so that, when called upon to labour, they might do so with intelligence and skill. And as there would be an abundant supply of food and other accommodations forthcoming from the general stock, children might be expected to grow up, for the most part, robust and strong. Indeed, as the production of men in the highest state of perfection would then be regarded as the most important science, the fullest development of the powers of man, both physical and mental, might be anticipated.

The last advantage which we shall name is this :—Under a communistic state the increase of the productive powers would not be calculated to produce jealousy. On the contrary, whenever any discovery was made, or any useful invention perfected, all would rejoice, for all would be directly benefited. Every useful invention would *decrease* the amount of manual labour, and at the same time *increase* the amount of enjoyment of the community at large.

These, and many other similar reasons, may be adduced, all of which tend to show that Communism would promote the happiness of man.

U. M.

It is, perhaps, amazing that the strongest minds are capable of being upset in an instant. A man may have a perfect command over his features ; he may have an equally perfect command over his nerves ; but he cannot have a perfect command, nor anything like a perfect command, over his mind. He may be able to stand and walk erect ; he may be able to maintain the steadiness of his eye, and the firmness of his voice ; he may be able to suppress every show of emotion ; but he cannot suppress the emotion itself. He may have in full bloom what is technically termed "moral courage,"—for technical the term may be said to be, seeing that physical courage is hard to be defined ; he may be extremely calm and collected ; he may conceal effectually his feelings from others ; but from himself they will not be concealed. Within his own breast they are in full operation ; their influence may rack him, although the effect be unseen.—*Anon.*

There is room enough in human life to crowd almost every art and science in it. If we pass "no day without a line"—visit no place without the company of a book—we may with ease fill libraries, or empty them of their contents. The more we do, the more we can do ; the more busy we are, the more leisure we have.—*Hazlitt.*

The Societies' Section.

PUBLIC SPEAKING.

HAVING in our former volumes described at considerable length, and with a good deal of minuteness, the method of representing outwardly the several passions, feelings, desires, emotions, sensations, &c., which can affect the human mind, we now proceed to offer to our readers a few general remarks, which we hope may be found serviceable in enabling such of them as aim at the attainment of excellence in the Art of Speaking to succeed in their endeavours.

Our first remark shall be one, the attending to which you will find is all-important, viz., Be natural; feel yourself what you endeavour to enforce upon the minds of others; be earnestly zealous, and avoid affectation. If this be done, you will find that the contagion of emotions affects the mind of others by that sympathetic connexion which the expression of true passion invariably produces. The public have now learned to believe, with good old Æschylus—

“ Words are the counters which men cheat withal ;
But look—the speaking eye—the quivering lip—
The stricken heart, that sends up to the cheek
Its crimsoned flush—these only will I trust,
And these no proofs of speech can e'er gainsay.”

If a speaker is thoroughly impressed with the importance of the topic upon which he speaks—if he is really sedulous to persuade and convince, rather than to cajole and please—if his whole soul is wrapt up in the truths he is about to utter, then he need not fear, for he will be earnest, he will be natural, he will convince, and he must please.

2nd. Endeavour to correct that fluttering of the heart, confusion of mind, and ringing in the brain, which is apt to overcome young speakers, from their tendency to believe that the members of a meeting

“ Make up in number what they want in weight,”

and thus become

“ A many-headed font of wisdom.”

Men do not become preternaturally wise merely because they are “in public meeting assembled.” Each man is as strictly individual then as in his own house. To believe otherwise is to take measures to disconcert one's self—is to lay up a store of thoughts calculated to occasion absurd bashfulness, timidity, fearfulness, and consequently to produce failure. Nothing is more correct, so far as public speaking is concerned, than that “the fear of man bringeth a snare.” You must believe that you are superior to the public before you venture to instruct the public; and should you stammer through your speech in broken, abrupt sentences, through faintness of heart to fulfil your mission? It requires intrepidity of opinion and independent sturdiness of thought to tell the people home-truths; and there is nothing else of which they stand so much in need as men of such a stamp.

3rd. Study conciseness of expression, perspicuity of thought, and precision of language.

Do not learn to play with your subject, and “talk about it and about it,” but get *to the point, and keep to it*. Do not attempt to set every sentence of a speech in jewels. *To make every sentence equally sonorous, brilliant, smart, pithy, &c., is the most certain*

of causing the speech to be felt as bombastical or monotonous. It resembles a sea in a storm; a sky of continuous and never-ending blue; a trade-wind always blowing; a changeless sameness, which cannot but fall upon the sense, and weary the soul. The consecutive nature of thought, accuracy of statement, purity of expression, choiceness of use of words, are the chief points deserving of attention; gain these, and all other qualities will follow. A public speaker should possess the power of launching forth into fire, flashing, burning, sarcastic invective, but should seldom employ it; should train himself to the perception of character, and adapt his language and style to the occasion on which, and the parties to whom, he speaks; should have a vein of drollery and wit, which should be very sparingly used; but he should never condescend to be the occasion of "the laughing laugh of rude joke-catching ignorance."

Dr. "Every one must have remarked, that whatever impressions are intended to be placed on the mind of man, are always best received when addressed to his heart, through the most common associations. Whether we wish to explain, to convince, to touch, or to amuse, we must refer to something that is habitual and pleasing; and therefore the use of figures in eloquence is not so much to enrich and to deck, as to find admission to the soul of the hearer by all the paths which its own habits have rendered most easy of access."—*P. R. James's Darnley*, p. 133.

Speech was not given "to conceal our thoughts," but is, or ought to be, the expression of the mind. The mind of man, if powerful, can exercise a glorious dominion; but the most captivating sovereignty which can be offered to it is to utter its thoughts in words, and to go forth amongst men as a ministrant of gladness, instruction, and purity, an exciter of noble deeds, and high and holy aspirations;—a dominion this which rules the spirits of men, regulates their impulses, governs their thoughts, and is the real monarch of men's actions; a dominion this so grand, that man may well labour hard for its attainment. But it is remembered that a fearful responsibility lies with him who attains this monarchy of words. If his eloquence be used in the cause of truth, justice, and right, in condemnation of falsehood, oppression, and wrong; if the cause of progress, and love, and good deeds, find him an ally; and the retrogressive, the stationary, the fiendish, and the hate-engendering find in him a strong and a determined foe, it is well. But perfect eloquence may sometimes employ the deepest pathos, the mightiest agitations of thought, the fiercest torrents of invective and sarcasm against the true and the good; may use the guise of truth, and wrap itself in the garb of an angel of light, while it advocates the wrong, and insinuates calumnies as if they were sparks from the throne of heaven. It is true that the influence of this Satanic cast rules but for a moment, and that the good and the holy must ultimately triumph; but woe be to him who retards the world's progress even for a moment, who sows such tares in human souls as shall produce a harvest of distress. Let not then the seductions of present applause, the love of momentary reputation, cause you to cast dark shadows over the souls of men. Cherish in your heart the love of virtue, earnestness for the cause of truth, clearness of thought, transparency of diction, graceful and becoming delivery, a free, fluent, and ready delivery, a pure heart, a spotless character, a mind unclouded by falsehood, a soul strong in the cause of progress, unflinching in its advocacy of right; educate yourself; think, act, speak, and fear not; for attention to these things constitutes the noblest and most important part of the Art of Public Speaking.

THE IMPORTANCE OF A RIGHT SELECTION OF BRANCHES OF STUDY.

FROM the limited powers of the human mind, and the restricted time which is usually devoted to intellectual culture, it is important that a selection of objects should be judiciously made from the numerous pursuits of literature and of science. That such a selection should be made with a distinct reference to the engagements of future life, it is readily conceded; but with a view to ultimate success, those engagements should be, in the order of time, a secondary, and by no means a primary, object of attention. In a liberal education there is much which is preliminary. No superstructure should be attempted till the basis be rendered broad and firm. The first object of solicitude should be to give vigour and expansion to the faculties of the mind; and whatever pursuits are best adapted to secure this end should be selected by the instructor, and by the learner should be regarded with interest and prosecuted with ardour. Let him not imagine they are of inferior importance because he cannot discern any direct connexion with the leading object of his professional career. Let him rather inquire into their tendency to subject his mind to a salutary discipline, and to form those habits of thought and study, by which his future progress may be directed and facilitated. The student in theology, for example, may perhaps entertain doubts with regard to the utility of studies in *mathematics*, or in *the philosophy of the human mind*; yet it is not difficult to exhibit the direct and powerful tendency of these pursuits to generate habits of incalculable value to those who, in the discharge of their professional engagements, will find occasion for the exercise of accurate discrimination, and the power of conclusive reasoning. Could it even be shown that the researches of mathematical science, and of mental philosophy, would impart but little information of real value, still it might be contended, that the advantages accruing from the very efforts of intellectual energy which they call forth, must secure to the student an ample remuneration for his expenditure of time, and to the tutor a full justification of the course prescribed.

Such was the importance attached to *mathematical* studies by that able reasoner, the late Bishop Watson, that he regarded an initiation into the processes of geometrical demonstration as incalculably advantageous in promoting mental discipline. He stated it to be his deliberate opinion, that were the attention restricted even to the first book of Euclid's *Elements*, a familiar acquaintance with its reasonings could not fail to render substantial benefit to the mind of the learner.

In recommending a vigorous application of the mind to the solution of a question of difficulty in *intellectual philosophy*, the late distinguished professor of moral philosophy in the university of Edinburgh* thus urged and encouraged the efforts of the students:—

“In some former *severe* discussions like the present, I endeavoured to extract for you some little consolation from that very fortitude of attention which the discussion required, pointing out to you the advantage of questions of this kind, in training the mind to those habits of serious thought and patient investigation, which, considered in their primary relation to the intellectual character, are of infinitely greater importance than the instruction

* Dr. Thomas Brown.

which the question itself may afford. 'Generosa animus labor currit.' In the discipline of rowing, as in the training of the Athlete, it is not for a single victory which it may give to the youthful champion that the combat is to be valued, but for that knitting of the joints, and hardening of the muscles, that quickness of eye and collectedness of ear, which it is forming for the struggles of more illustrious fields."—*Durder's Mental Discipline*.

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

The Shapsteadbury Society, London.—This is the title of a small society of Christian young men, and has for its object the intellectual, religious, and the improvement of its members. The ordinary business consists of discussions, essays, doctrinal and musical exercises. The meetings are held weekly in St. Dunstan's Infant Schoolroom, Fetter-lane, Finsbury.

Ordnance Literary and Scientific Institution.—The members and friends of this Institution having held their first annual meeting. The chair was occupied by Mr. Richard Walmesley, and one of the secretaries read a report, from which it appeared that the existence of the Institution was owing to the active exertions of a few gentlemen of the town. The report, on the whole, was encouraging, and showed an income of £200 for the first year. The officers and committee for the ensuing year were subsequently elected, and other business transacted.

Salisbury Mutual Improvement Society.—The society has just commenced its third session, meeting every alternate Friday. The second Friday in the month is for the delivery of lectures, and the fourth for discussions. The committee have made arrangements for the delivery of another course of public lectures. The success of former series has led them to propose a longer and more varied course, including lectures from the Royal Polytechnic Institution, London. There are about forty members present. President, Rev. G. W. Clapham, vicar; president, J. E. Bernard, Esq.

The Nelson Association, Brunswick-street, Edinburgh.—The second anniversary of the society was celebrated in their usual place of meeting, St. Stephen's School, Brunswick-street, on Tuesday, November 4th, 1861. The room was tastefully decorated for the occasion with laurels and evergreens, and at seven o'clock the members with their friends, sat down to supper of tea and coffee. The chair was afterwards taken by the Rev. Mr. Nelson, of New Ebb, late minister of St. Stephen's School, on the president and founder of this association, who delivered an interesting address on the advantages of an early religious education, and the results which flow to young men who pursue a course of religious, moral, and intellectual improvement. Addresses were afterwards delivered by various members of the association, on 'The Claims of Religion on the Education of Young Men, &c., &c.,' and the evening was enlivened by appropriate songs and recitations. The meeting closed at ten o'clock, a meeting well pleased with the arrangements. The meeting had forward with hope, that during

the coming year their exertions in carrying out the objects of the society—the religious, moral, and intellectual improvement of its members—may be attended with success, and that it may continue to be a prosperous society, advancing the cause of knowledge, virtue, and religion.

Boston Albert Improvement Club.—The first session of this society was held on Thursday, November 13th, 1861. About forty persons sat down to tea. After tea, Mr. A. Cress was called to the chair and the applause of the meeting. He said that he understood the society only came into existence during that year—a year big with important events, and he trusted that its formation would not be one of the least important events for influencing the future advancement and welfare of Boston. The society, though young, showed every appearance of strength and vigour and had elements within it which would cause it to continue to flourish, and to bear good fruit. The chairman proceeded to remark on the advantages of Mutual Improvement Societies, and called upon the secretary to read the report for the past quarter, from which it appeared that about twenty had been handed to the committee. The report had been held and the number appeared rapidly to increase. The committee intended further steps to be taken, such as the establishment of a good club reference library, a works on logic, language, science, &c. The report also mentioned the establishment of a postal communication with certain views on Lancashire with respect to an association for mutual instruction and community. The report having been read, was followed by the retiring address to be given by Mr. G. West. A number of amendments were introduced and interpreted with great and reading of "Burns' Cotter's" by D. Saunders, and an original book (president), were especially members' approbation. The off in a very agreeable manner, to a close about half-past ten, singing the National Anthem, with Burns' new and admired

Worcester.—Smith Church Association.—The celebration of the anniversary of this association took place on Friday evening, September 4th, 1861, at 11, Main-street, Worcester. The meeting was well attended, and the evening well passed with the arrangements. The meeting had forward with hope, that during

ciation, having been called to the chair, addressed the meeting (which was numerous and respectably attended) in a few words, congratulatory of the society's attaining its second anniversary, and of the amount of intellectual work done by its members during a period of *two years*; and concluded by calling on the honorary secretary, Mr. John Cook, to read the report for the past year, which stated that from September, 1850, to July, 1851, ten subjects had been discussed, viz. :—

1. Was the execution of Charles I. justifiable?
2. Has the discovery of America been beneficial to the world?
3. Was the banishment of Napoleon Bonaparte to St. Helena justifiable?
4. Has the discovery of gunpowder been beneficial to mankind?
5. Is the character of Queen Elizabeth deserving of admiration?
6. Ought Papists in a Protestant country to have the same privileges as where the Pope's authority is recognised?
7. Had William the Conqueror any right to the British throne?
8. Is war, under any circumstance, opposed to Christianity?
9. Had Charles Edward, the Pretender of 1745, any right to the British throne?
10. Was the execution of Lady Jane Grey justifiable?

Six essays had also been read by members of the association on the following subjects :—

1. On chirography, and the benefits derivable therefrom.
2. On music.
3. On the rise and progress of language.
4. On man, the superior of creation.
5. On man's happiness.
6. On decision of character.

On the 14th of August last, a lecture on astronomy was delivered to the association by the Rev. James Scott.

The report was unanimously adopted, and ordered to be placed on the minutes of the meeting.

The following resolutions were then moved, seconded, sustained, and unanimously carried :—

1. "That as our interests as intelligent beings are greatly promoted by the cultivation of the mind, the prosperity of our association ought ever to be a matter engaging our warmest consideration."

2. "That being alive to the importance of a well-disciplined and informed mind, the members of this association are determined, by God's help, to increase their efforts to secure those advantages which always result from a vigorous and persevering pursuit of knowledge."

3. "That while it is to be regretted that there is so much indifference manifested in this colony with respect to Mutual Improvement Associations, the members of this society ardently hope, that the time is not distant, when many, having the welfare of the natives at heart, but who have hitherto kept aloof from such institutions, will, by their countenance and support, give an impetus to the noble work of mutual improvement."

4. "That while the cultivation of the mind is a duty incumbent on all men, it is especially so with Christians, who are the servants of that God, one of the principal features of whose character is intelligence."

5. "That this institution, being based on christian principles, is an innocent, a lawful, and yet a powerful means of advancing the intellectual and moral welfare of young men in general."

The business of the association being now brought to a close, the rev. patron vacated the chair, which was taken by the vice-patron, the Rev. Charles Rattray, and a cordial vote of thanks to the former was passed unanimously. The friends invited and members of the association then sat down to a richly-furnished repast, after which they separated, highly gratified with the proceedings of the evening.—J. C. D., Jun.

Yeadon Mutual Improvement Society.—On Wednesday, November 5th, the members of this society held their sixth annual soiree, on which occasion upwards of 400 persons took tea together in the old chapel schoolroom. The room was tastefully decorated. After tea, the chair was taken by the Rev. Robert Holmes, Baptist minister. The report of the society was read by Mr. J. K. Brown, secretary, and addresses were delivered by the Rev. Jos. Shaw, Independent minister, Rawden, Mr. A. Dick, W. E. Forster, Esq., Mr. P. Slater, and several other members of the society. It appeared from the report that the society was in a very flourishing condition. During the past year twenty-four members had been enrolled, making a total of ninety-six *bona fide* members. Ten lectures had been delivered during the year, and the attendance had been very good. During the year seventy volumes had been added to the library, making a total of upwards of 300, while the number of issues during the year amounted to upwards of 1,300. The treasurer reported a balance in favour of the society.

The Kilmarnock Young Men's Biblical Association.—In the beginning of last month, fifteen young men in this town met for the purpose of forming a society for the moral and intellectual improvement of its members, by means of essays and extracts on subjects connected with scripture. Rules were drawn up, for some of which we are indebted to your "model rules," which were introduced to their notice. The society is formed on principles similar to those of "The London Young Men's Christian Association." The opening lecture was delivered by the president, John Stewart, Esq. The second lecture was delivered the following week by Mr. William M'Whirter on the subject—"The claims of the Bible upon our careful and prayerful study." It was a rich treat; learned, beautiful, neat, and elaborate address. The members then began to give an essay, or extract, each week in rotation. The first was on "The present condition and future prospects of man." The second was read last night; its subject—"Timothy." The essays are restricted to twenty minutes; and then the members are allowed ten minutes each to make remarks upon them, and upon the subjects of which they treat. Our society now numbers about thirty members, and all seem well pleased with what has already been accomplished, and are full of hope for the future, anticipating a rich harvest of lasting good in the developing and expanding of their intellectual powers, and in purifying and elevating the moral natures. I am sure you will be highly gratified to hear of another society having been formed for the improvement of young men, to whom you feel so deeply interested.—R. K., Jun.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

65. Would some of your correspondents kindly inform a "Subscriber" what would be the expense of being articulated to a solicitor, and what would be the relative proportion of time spent at the desk and at study?

66. I am desirous of becoming proficient in Mental Arithmetic, and should esteem it a favour if any of your numerous readers would direct me to the best method for attaining this object.—C. Y.

69. Remembering the answer given by a learned man as to how he became possessed of so much knowledge, "by not being afraid to ask," I venture to solicit a reply to the following:—What are the peculiar doctrines of Pantheism and Rationalism?—REPUBLICAN.

70. *Carthaginian Names*.—The Phœnicians and Carthaginians (and indeed all the great nations of antiquity) gave names to persons partly formed of the names of their several divinities; hence, *Abibal* signifies *Beal* is my father, or my father is *Beal*; *Ethbeal*, with *Baal*; *Asdrubal*, help or assistance of *Beal*; *Hannibal*, grace or mercy of *Beal*. These examples have been collected from Gesenius, &c., and the following two names, mentioned in C. Crispi "Sallustii Jugurtha," cap. vi. sect. 5, are evidently of the same class, viz.:—*Adherbal* and *Mastanabal*. What is the composition and meaning of each name?—G. W. H.

71. In Lord Byron's lines to Inez, in the first canto of his "Childe Harold" occurs the following verse:—

"It is that settled, ceaseless gloom,
The fabled Hebrew wanderer bore;
That will not look beyond the tomb,
But cannot hope for rest before."

Could any of your correspondents kindly inform me to whom Byron referred in these lines?—FIDELIS.

72. Will any of your correspondents inform me of the best method of acquiring facility in the execution of Pianoforte Music? I have been in the habit of practising for three or four hours a day for the last two years without attaining skill above mediocrity.—T. A.

73. How should a person begin and pursue the study of Botany, who is entirely ignorant of it? and can he hope to succeed without the aid of a teacher?—A. B. M.

74. Will any of your correspondents inform me of the best method of studying Euclid, and whether it is necessary to draw all the diagrams, or merely to read and understand the propositions?—C. M.

75. "Clericus" is engaged in the scholastic profession, and is very anxious to gain admission into St. Bees College, Cumberland, with a view to his entering the ministry; but, unfortunately, he lacks the necessary pecuniary qualification, and would, therefore, feel greatly obliged to any correspondent who can demonstrate to him the *vanity of the stage*, "Where there's a will there's a way," by suggesting to him some plan

of effecting a project so very desirable to him, under existing circumstances.

76. I am quite unaccustomed to composition, and for that reason may express myself obscurely in endeavouring to make known my wants. 1st. How shall I attain fluency of language? Cicero and Pliny, I perceive, advise the translation of good works from one language to another. Greek and Latin I do not understand; French and German I do a little. 2nd. How shall I secure a systematic arrangement of ideas? 3rd. Would the study and committal to memory of the finest orations of Cicero or Demosthenes in their English garb be of service, or would the attentive reading of some of our own poets be more so? If it is thought that composition would be preferable to translation, I shall enrol myself as a subscriber to your "Young Student and Writer's Assistant."—H. T. M.

77. Will some of your correspondents inform me of the best work by which I may obtain a sound and true theory of Mental Philosophy, based on the physical nature of man, and embracing the subjects of life; mind, its dependence on, and independence of, organization; sanity of mind; morbid impulses; thoughts, and feelings. I have seen Johnson on "Life, Health, and Disease"; Combe on "Physiology"; and Knight's edition of Southwood Smith's "Philosophy of Health." In the preface and end of this last work it is stated, that it is intended to be introductory to an account of the physical and mental powers of man: can you inform me if this work is published? In Chambers's "Wonders of Human Folly," Upham's "Outlines of Imperfect Mental Action," and Sampson on "Criminal Jurisprudence," are recommended: would either of these aid me in attaining the object I have in view?—P. S.

ANSWERS TO QUESTIONS.

61. *Musical Advice*.—Should H. W. H. be able to avail himself of a good master, and devote several hours daily to practice, he might no doubt arrive at great proficiency in playing the pianoforte, as he must possess an ear for music, otherwise he could not keep in time and tune in joining in singing.—H.

64 and 66. *Admission to the English Bar*.—Having seen the question of D. G. B., I beg to offer a few suggestions, such as he may find of use. As I am in the legal profession he may depend upon what I say as actually true.

D. G. B. should have specified which Bar he desired to know about, the Chancery or Common Law; but as I am thoroughly acquainted with the first-named, my remarks will bear upon that division only.

D. G. B. may, perhaps, be aware, that a good college education is nearly indispensable for a young advocate; and, besides, if he has not been to one of the universities, his course of reading with an admitted barrister must be of much longer duration.

The first step, then, is to become a member of one of the Inns, by entering your name on the books of the society you select. There is Lincoln's Inn, Middle and Inner Temple; Gray's Inn is nearly an obsolete one now.

You then become pupil to an equity draughtsman, with whom you stop six or twelve months. If you think by hard study (which all embryo lawyers must practice) that you will be tolerably proficient in the technicalities of the profession at the end of six months, you pay the gentleman you read with fifty guineas. If you require double that time, you must also double the fee.

The expense of entering your name on the books of a society, "eating your terms," &c., is about 120 guineas. The Society of Lincoln's Inn requires you to enter into a formal bond.

It is, of course, obvious, that only a moneyed man can become a barrister, because there is much expense—the expense of entering your name, of eating your terms, of paying your pupillage fees, of taking chambers, and of purchasing a library.

I forgot to say, that after eating your terms for about eight months, you are "called to the bar," and this irrespective of your legal acquirements.

Next, as to the "plan of study." This is all-important. The really good lawyer should aim, not only at a perfect knowledge of the English law, but also tolerably to understand that of old Rome, and especially that of Scotland; for when the advocate goes before the House of Lords, a knowledge of the latter is frequently required.

The art of preparing bills, answers, demurrers, exceptions, pleas, &c., will all be taught him by the gentleman D. G. B. reads with. The standard work here used, is Van Heythusan's "Equity Draughtsman;" but this chamber business has been much abridged by the last orders of Lord Chancellor Cottenham, by which short claims are now used instead of bills in many instances.

The very best books that D. G. B. can purchase are the following, to be read in the order they are placed:—Sydney Smith's "Chancery Practice," two volumes, last edition; Sydney Smith's "Hand-Book"; Bowyer's "Lectures at the Temple"; Bowyer's "Constitutional Laws of England"; Shelford on "Mortmain"; Roper on "Legacies"; Roper on "Husband and Wife"; Mr. Justice Williams on "Executors"; Sugden on "Vendors and Purchasers" (Dart's Abridgment is a very good one); Spence's "Principle of the Court of Chancery"; these and many more will D. G. B. require.

In conclusion, I beg to say, if D. G. B. would furnish any address where a letter could be sent, I would willingly forward to him a more explicit letter of suggestions than this; and having a practical knowledge of the law myself, my hints might show him the shortest method of acquiring its rudiments.—JUSTINIAN.

65. *Electro-Biology and Braidism*.—Electro-Biology is a designation recently applied to the mesmeric phenomena by Dr. Darling and other lecturers, and means, literally, the electric doctrine of life. This doctrine they infer from the means they use to produce the hypnotic or mesmeric state; viz., fixing the attention of each patient upon a small disc of zinc and copper, which he is made to place on the palm of one of his hands. Mr. Braid, of Manchester, maintains that a similar effect would be produced by lengthened gaze upon any object, and that, therefore,

there is nothing of an electric nature connected with it. He says, "The true cause of this 'vigilant phenomena,' is not a physical influence from without, but a mental delusion from within, which paralyzes their reason and independent volition, so that, for the time being, they are as mere puppets in the hands of another person by whom they are irresistibly controlled, and can only see, or hear, or taste, or feel, or act, in accordance with his will and direction. They have their whole attention fixed upon what may be said or signified by this superior power; and, consequently, perceive impressions, through the excited state of the organs called into operation, which they could not perceive in their ordinary condition." After detailing a number of experiments made by himself on patients in the waking position, he adduces the following:—"In like manner, several other patients whom I took into the dark closet could see nothing, until told to look steadily at a certain point, and they would see flame and light of varying colours proceeding from it, which predictions were speedily realized, whilst they were wide awake, and with nothing but bare walls toward which to direct their eyes. Not only so, but I have, moreover, ascertained that, even in broad daylight, a strong mental impression is adequate to produce such delusions with certain individuals of a highly imaginative and concentrative turn of mind. This fact is beautifully illustrated in the case of a gentleman, twenty-four years of age, who had suffered severely from epilepsy for eleven years. When taken into the above closet, and tested as the latter, he likewise saw nothing, till I suggested that he would see flame and light; after which prediction he very speedily saw it accordingly, not merely where the magnet was, but also from the other parts of the apartment. Now this patient, and the two last referred to, when taken into the closet after the magnet had been a long time removed to a distant part of the house, still saw the flames—a clear proof that the whole was a mental delusion, arising from an excited imagination, on the point under consideration, changing physical action."—A. C.

67. *The Law—Solicitors*.—In answer to a "Subscriber," the first and certain expense of his being articulated to a solicitor is £120 for the stamp upon which the articles are engrossed. The premium to be paid for instruction, &c., varies in nearly every case. If you wish to be articulated to a solicitor of good standing, and to board and lodge in the house during the five years of articles, £500 would not be out of the way. If you have taken a degree at either of the universities your term of articles will be three years only; and during the last session of parliament an act was passed extending this privilege to certain students therein enumerated. In such case your premium would be proportionately less. With respect to the relative proportion of time at the desk and at study, this will depend, first, upon the arrangement made at the commencement; secondly, upon the extent of business in the office; and thirdly, upon your own inclination. If you desire to understand not merely the theory, but the practical and mechanical branches of your profession, you will not mind sitting pretty closely at the desk, at least during the first year or two of your term. You will still find time for your studies, and will understand them better for seeing some-

thing of the practice. As a general rule, with
to divide your time almost equally between
two impositions would be unprofitable. On
any circumstances much depends upon your
On your estimation as whether you will be
some collection of cheap duty but this will
required by the particular courts in which
have to qualify as a practitioner. You may
draw £40 under this head. At present there
further annual duty payable for removal of
filings—on conveyance returns £2 on these
landed, £12 per annum. For the first three years
of practice, half these sums. If you will allow
your of gratuitous advice assuming that you
young are desirous of having a thorough know-
ledge of the law, and your resources are not large
you will endeavour to enter a respectable ad-
vocate's chambers, at a nominal, or even, at first,
remuneration. He industriously endeavours
to obtain everything you are and do and at
the same time you have resorted to your simple
case to justify it, apply to him for your advice
and if he be a gentleman he will meet you at
the library your services have deserved. If
if he be not, there of course, you will
desire to stay with him, but will seek for
any desirable engagements. It is no disgrace
to profess that many of its brightest men
than have thus entered the ranks. Why then
I've not made another?—C. W. Jan.

(3) *Mental Arithmetic*.—Allow me to direct attention of C. Y. and others who participate in same, to the following valuable remarks mental arithmetic by Professor Lieberman.

There are two sorts of special arithmetic. The first consists in the actual performance of a manner different from that which used in the paper and more fitted to the use in which computation and manual version are put together. It should never be forgotten if the question is the thing to be principally obtained. The second consists in the substitution of some rules in particular cases (such as carrying in the particular numbers to be used in the method) when the above rule is an error. The paper rule for the paper process is for a third case, but, in essence of being slightly performed, which the common rule is not, it is the character of belonging to special arithmetic. As an example of the first sort, take the addition of 45 and 47. In doing this correctly the 10 and 00 should be added first, and 100 retained, 25 and 7 should be then added and 120 and 25 together. Or else, 45 and 50 should be first added together, giving 100, and 7 then added, giving 107. This process put down on the paper would cause more writing than the common one. As an example of the second sort, take the rule of subtracting the price of a pound from that of hundred-weight, — or two-pence and one-half for every pound owing to the price of a hundred weight. Thus 2 lb per cwt. is instantly 39s 6d, 3 lb per lb. 2 lb 10s per cwt. is 37s 9d, 4 lb per lb. This process is as much of a substitution on the matter as it is in the method.

The first mark of spiritual enlightenment has been to this question, and it would seem as if what the man of it is to the catholic returned to were the men of the people's own thoughts applied to a clear perception of the meaning of what he is about. If, as probability, the catholic which is most easy to be said and not done is to be done, it is to be done.

people are, when instructed in an intelligent manner, free persons for themselves, many workers know the following to the evidence of Mr. Wood, in his "Account of the Edinburgh Agricultural School," though it would have been more satisfactory if the same previously given to the subject had been stated — "They will multiply such a line of figures as

7 6 5 4 3 2 1 0 9 8 7 6 5 4 3 2 1 0

by 9, 8, or any other figure, in less than the sixth part of a minute. From such a line they will subtract another of the same length in the ordinary way in about seven seconds, and if allowed to perform the operation from left to right while the question is under discussion, though it should be directed with a rapidity which would not permit ourselves to take down merely the original figures, they will present the whole operation both question and answer in scarcely one second from the time of announcing the two figures. In addition, they will work up or on lines of eight figures each, in the ordinary way, in less than one third of a minute, and if allowed to perform the operation while the question is dictating in about three seconds. All other calculations they perform with proportional celerity. These modes of working during dictation (where allowed, are suggestions of their own, in their zeal to surpass each other, and not taught by the master.

We turn to the second sort of mental arithmetic : that to which the processes are only mental as being more easy and therefore being better on paper than the usual ones as well as possible without it. Of all the aids to abbreviated computation there is nothing like the ready knowledge of decimal fractions, and of all the advantages of decimal fractions, none is so conspicuous in commercial arithmetic as the use of the decimal parts of a pound. It will be worth while to re-arrange and extend this mode of operation, which sets the advantage of a decimal currency in a strong light, showing that it is better on our savings banks to have a rule by which to go out of it into decimals and working the question in decimals, to return the answer into ordinary denominations than to remain in those ordinary denominations and work the question by them.

[illegible]

For the fourth and fifth places of decimals, fill both with 0 for every further place the last answer and 1 space for every 99 in the result, or, if found more easy, for every three halfpence in the things used. Thus for $\frac{4}{9}$ the fourth and fifth places are $10 \div 9$ or $79 \div 9$ or 73 for $\frac{4}{9}$, $10 \div 1$ or 99 for $\frac{4}{9}$, 32 for $\frac{1}{3}$ of $\frac{4}{9}$.

For all decimal places after the 9th, let the number of nines show the last three halves of a centimeter. Let 0 be a denominator and use its figure in this fraction reduced to a decimal. These can be turned to the head, and will then be remembered, easily —

1 - 10000, No.	1 - 10000, No.
1 - 10000, No.	1 - 10000, No.
1 - 10000, No.	1 - 10000, No.

It is not often, perhaps, that more than five decimals are wanted, and three will most frequently be sufficient; but those rules are valuable by which, in case of need, approximation can be extended. A very little practice would enable any one to use the preceding rules so as to write down at once, to any extent required, any decimal of a pound; instead of £176 13s. 10½d., for instance, to put down £176.6947916666, &c. Considering the very great facilities afforded by this rule, which are more than those who have not tried it have any idea of, it would be worth while to save trouble yet further by learning the multiples of 4 up to 23 × 4 or 92, and those of 1½d. up to one shilling.

The inverse rule, to turn a decimal of a pound into money, is as follows:—A pair of shillings for every unit in the first place; a shilling for 50 (if so much) in the second and third places; a farthing for every unit left in the second and third places, after abatement of 1, if what is left be 25 or upwards. Thus £.477 is 9s. 6½d., and £.217 is 4s. 4½d.

The labour of questions in commercial arithmetic is much more than halved by the use of the preceding rule, and the risk of error reduced in proportion. It is not easy to make those believe this who have grown up in the use of the ordinary methods. We shall point out a few of the advantages attending the transformation, in rendering questions capable of being solved mentally, with ease and dispatch.

The two great modes of estimating fractions of a sum, namely, the number of shillings, &c., in the pound, and the per centage which the part is of the whole, can be reduced to one another, or either mode compared with the other, almost instantaneously. Suppose, for example, it is required to know how much per cent. of his debts he can pay whose assets are 8s. 7½d. in the pound. The regular book-arithmetician would proceed as follows:—

As £1	:	8s. 7½d.	::	100
20		12		415
<hr/>				
20		103		960)41500(43½ per cent.
12		4		384
<hr/>				
240		415		310
4				288
<hr/>				
600				22

The one who is used to shorten his rules will say that 8s. is 40 per cent., and 8s. 6d. 42½ per cent., and will perhaps rest satisfied with that approximation. But the method we advocate enables us to write down at once .432 as the fraction which 8s. 7½d. is of a pound, and thence to name 43½ per cent. as the proportion required. If still greater precision be demanded, the advantage is still greater; for .43229 gives £43 4s. 7d. per cent.

With regard to most rules of abbreviation there is this to be said, that however convenient they may be, each in its place, they will be so seldom required that they will be forgotten: so that, when an occasion for the use of any one of them arises, one person will have finished the question in the ordinary mode, while another is recovering the abbreviated rule. It is only with respect to processes which are sure to be often wanted that such rules are therefore worth their trouble: each kind

of business has its own cases, which need only be learned by those who are to attend to that business. In the books of arithmetic there is the fault of presuming that every person is to learn every variety of commercial rule *by rote*; compound interest and the determination of the price of a mixture from that of the materials are supposed to be equally necessary to all, though the subdivision of business makes it as certain as any thing which can be predicated of two rules of arithmetic, that no one who requires one of the above rules will require the other. A mistake of the same kind is very likely to be committed in teaching rules of abbreviation.

The time is not yet come for a very extensive use of tables in mercantile affairs; nor can it come until a decimal coinage is established. When the present coinage has become matter of history, it will not be the least amusing anecdote connected with it, that the great financiers of the nation were so much afraid of the fractions of their own money, that they preferred to lose eight pounds out of three hundred in the collection of a tax, that it might be *exactly* seven pence in the pound, rather than let it be three per cent. It is obvious enough that the income tax was meant for the nearest approximation to three per cent. which would give an exact number of pence in the pound; and it was supposed, for example, that in calculating the tax on £587, the first of the following calculations being the easier would be substituted for the second or more difficult:—

587	587
7	3
<hr/>	
12)1109	17,61
	20
20)342-5	
	12,20
£17 2s. 5d.	12
<hr/>	
	2,40
	4
<hr/>	
	1,60

Answer £17 12s. 2½d.

But, in truth, had the rule for procuring the decimal parts of a pound been well known, it would have been easier to do the second than the first, as follows:—

587	
3	
<hr/>	
1761	17610 = £17 12s. 2½d.

If any person not much accustomed to computation, and feeling its difficulty, should endeavour to mend his habits by the practice of the foregoing recommendations, we warn him that he will have his period of difficulty, during which he will not be able to see that he gains anything. He has to acquire what he probably never aimed at before, quick and ready habits of doing a few simple things. Without resolute determination he will do nothing; if he feel that he is not of the nature of those who face difficulties and conquer them, he had better not proceed to the trial. There is no use in disguising the fact that persons of ordinary memories never become good computers without hard work and steady perseverance; but, on the other hand, it must be allowed that long

practice is not necessary. As far as mere computation goes, there is no reason why excellence should not be attained in six months. Almost any person may become such an arithmetician, that his figures are as steady as the laws of the Nile and Persians, years and years before an active student in algebra will attain as great a chance of uniform correctness in the use of the

signs + and —. And as a quaint Hindoo writer sets off thus, "He who distinctly and severally knows addition and the rest of the twenty logistics, and the eight determinations, including measurement by shadow, is a mathematician;" so we will end by saying—He who can easily, rapidly, and accurately add, subtract, multiply, and divide, is a computer.—A.C.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XI.

1. With what is the Mind of Man naturally filled?
2. What is Observation?
3. What is Hypothesis?
4. What is the part which Induction occupies in Ratiocination?
5. What is Theory?
6. How do these unitedly operate in the investigation of Truth?
7. Give examples of their united action.

MATHEMATICAL CLASS.

Design of Class.

It may be well to state at the outset that this class is especially designed for the benefit of young men and others who are desirous of obtaining a knowledge of mathematics, but who have not the advantage of a living teacher. If, therefore, the exercises and solutions are found to be of a character so simple as to yield comparatively little pleasure or profit to the advanced mathematician, he will have the kindness to bear in mind that the class has not been opened for his especial benefit.

The plan which the teacher of this class intends to pursue is as follows:—

1. To prepare, from time to time, a number of questions in Arithmetic, Algebra, Geometry, and Mechanics, which involve important principles.
2. To receive from the members of his class solutions to the questions; which solutions, if correct, and provided they come within certain rules of correspondence (given on the wrapper of the present number), will be acknowledged.
3. To publish, from time to time, the best solutions which he may receive, with such notes as he may think calculated to render the solution more perspicuous.
4. It will be his privilege annually to award certificates of merit, printed on beautifully embossed cards, in gilt frames, to the three best in each of the following divisions:—
 1. Arithmetic and Algebra.
 2. Geometry.
 3. Mechanics.

In order that members may be the better able to judge of their own proficiency as compared with that of other members, the teacher proposes, when acknowledging correspondence on the wrappers, to connect the numbers of the propositions which each person is successful in solving with his initials.

QUESTIONS FOR SOLUTION.—I.

Arithmetic and Algebra.

1. There are said to be 1,500,000 tons of iron smelted per annum in Great Britain; the specific gravity of cast iron is 7.248. Required the side of a cube that would contain that quantity.
2. There is a rectangular field, the length of which is 950 links, and the breadth 870 links; included, however, in this admeasurement is a ditch which equals one-twentieth of the whole, and extends half round the field. Required its width.
3. A certain man found gold coins of the respective values of 27s. and 21s. each. Now, for every two that he found of the greater value he found three of the lesser value; and the entire worth of what he found was 64l. 7s. How many did he find of each?
4. A general distributed to 9 captains, 12 lieutenants, and 135 common soldiers, the sum of 1,799l. 17s. To every lieutenant he gave twice as much as to a private soldier, and to every captain three times as much as to a lieutenant. How much did each receive?

Geometry.

1. The sides of a triangular field are 1,290, 1,390, and 555 links respectively. Required the perpendicular, and an explanation of the principles upon which the operation is founded.
2. The area of the Exhibition building is 1,848 by 408 feet. Required the diameter of a circle containing an equal area.

Mechanics.

1. Required the units of work necessary to turn a block of granite in the form of a cube on to its edge, supposing its side to be 7 feet, and a cubic foot of it to weigh 170 lb.
2. How many feet of water will an engine of 70 horse power raise per hour from a depth of 120 fathoms? Explain the operations in both cases.

Notices of Books

The Degrees of Knowledge By Thomas
Dun. L.L.D. Dunbar & Allen

This is the first of a series of lectures to young men in connection with the Dundee Literary Bazaar. I wish and it is well worthy of the publicity which, by the aid of the printing press, has been given to it. The venerable lecturer dis- cusses upon the progress of literature and science in past ages, and takes a glorious though not always truthful view of their position in the present. He next dwells upon the means to be used to reap the great mass of quality from their present state of intellectual degradation and dis- cusses in a suggestive and somewhat conservative manner the importance of making intellectual efforts through institutions and young men a condition for national improvement.

We considered the following argued to the effect that of those who say that the objectives of the people is accomplished, so that there is no more will be effect contributed to the matter.

There is perhaps no country in the world, excepting Switzerland and the States of America, where the body of the people are better educated or more intelligent than in Scotland yet we need not go far either in the one or in the country to be convinced that the most advanced and improving notions and the general ignorance respecting many important subjects continually diminish with human improvement and progress among the great majority of the population. Of the millions and a half of inhabitants who constitute the population of this part of Great Britain there are not perhaps 11,000 of the enlightened part of the whole whose knowledge extends to any subject of importance beyond the range of their daily avocations. With respect to the remaining 1,070,000 it may perhaps be said with propriety that of the five hundred millions of the world they live in, of the same human constitution and needs which demand no culture and the vigorous action of men and animals by which it is interested of the nature and properties of the atmosphere which surrounds them, of the diseases which have been made suggestive by light, heat, electricity and magnetism, of the general laws which regulate the existence of nature, of the various combinations and effects of chemical and mechanical powers, of the machine and workshop of the planetary and the every where of the principles of legitimate management of just arrangements of the earth and man's power, even of the Supreme Being, of the genuine principles of moral action and of many other subjects interesting to a rational and immortal being they are almost as entirely ignorant as the wandering Tartar, or the nomadic Indian.

(1) (b) (3) (ii) of human beings which people the globe we inhabit, there are not perhaps 5 (b) (3) whom words are truly enlightening in that ought to be the province of natural persons for their own sake or from a pure love of wisdom. Independently of the knowledge required for their domestic professions and employments, let us their conduct from the mind of rational creatures for knowledge of those who have acquired a mastery of learning with no other aim than to

give a substitute, or to apply distinctions and points. And if this rule be admitted, I am afraid that a greatly mistaken view of human physiology, chemistry, literature, and even some natural and political sciences, and metaphysics would be applied to give the list of errors of science and natural sciences the truth. Assuming this statement, it will follow that there is not any intelligent act of the human race that passes his life as a rational creature being, employing his faculties in those trains of thought and action systems which are worthy of an intellectual nature. For us to be so the attention of mankind is universal anxiety to improve mankind to greater sublimity, and in gratifying the universal appetite of their nature they can be employed as little exposed to dignity to the lowest orders of animal existence.

The doctor does not share with those glowing expectations, but gives wing to his imagination, and presents at least a dazzling prospect of future glory. He says:—

"I beheld in the prospect of future ages the most magnificent changes in the improved lands of the hemisphere and of the physical world. I beheld the surface of the earth as no distant period situated with vegetation and architectural beauties: our deserts transformed into fruitful fields; our mountain dreariness our gardens producing the fruits of every clime; our highways broad and spacious; and at the distance of every quarter of a mile furnished with arms and towers; not the shadow and rudeness of the passing traveller; our electromagnetic lines and towers; the cities of pyramids and towers; our streets and our land open to the light of heaven; and our customs streets expanding into spacious squares; channelled with the solar beams and with pure, prosperity, and compassed with the refreshing breeze; our densely crowded cities almost completely demolished and new cities arising from their ruins, on noble and expansive plains corresponding to the extensive state of the human mind."

I behold the dominion of the earth transferred by the hand of groves and industry by the rolling down of torrents the driving of machines, and the universal cultivation of the soil the thousand batts of hedges wound by the plough, the ships and the forest-lightnings directed by the hand of art, to play in harmonious correspondence in the region of the clouds I behold locomotives, steamships, steam railways and all brilliant thoughts in production transporting multitudes of human beings from one city to another, from one ocean to another and from one continent to another with a degree of velocity which has never yet been attempted I behold the age devoted to the dignity of his intellectual nature no longer running the desert wild and uncultivated like the harem of gipsy throwing aside his scuffle-bow and his knife and directing his faculties to the improvement of his spirit, and to the most sublime arrangements I behold men of all nations and conditions cultivating a harmonious and friendly intercourse the sons of New Holland, America, Germany, and Madagascar, visiting the British Isles with the greatest

lets of their respective countries, and holds literary correspondence with the directors of philosophical and missionary institutions on the subjects of christian and scientific instruction.

"I behold the scenery of the heavens fully explored, and new prospects opened into the vision of the stars, the geography of the sun brought to perfection, and scenes of the eastern and western of its inhabitants exhibited; see the nature of comets ascertained, the origin of the various phenomena which appear on the surface of the planets explained, the constitution of the sun, and the nature of its spots defined, and the sublime scenes connected with new and variable stars, double and triple stars, or the thousands of nebulae dispersed throughout the system of boundless space more fully displayed."

"I behold the ministers of religion expounding to thousands of intelligent worshippers: higher themes and more elevated subjects than those to which they are now accustomed; instead, not confining their attention to a few fragments of the christian system, and a few points of religious contemplation, but taking a whole of divine revelation for their text-book and drawing their illustrations of it from all kinds of history, and from all the diversities of the universe."

"In fine, I behold the human soul elevated and refined, and endowed with multifarious knowledge, dropping its earthly tabernacle in the dust, and in another and a happier region of existence, pronouncing celestial investigations: a new empire opens, contemplating the creation of other worlds, exploring the wonders of divinity and omnipotence throughout the infinity of universes, rising nearer and nearer to deity, expatiating amidst objects of love and transcendence, and beholding new scenes of grandeur and sublimity rising to view in boundless prospect, while ages, numerous as the drops of rain, are rolling on."

Logic for the Million, a Familiar Exposition of the Art of Reasoning. By a Fellow of the Royal Society. London: Longman, Brown, Green, and Longmans.

We have never been favourable to writing down to the people, and we are always inclined to look on any eye of suspicion at the thought of "tailoring" which issues from the press. We have faith in the possibility of acquiring knowledge cheap through hard labour, diligent efforts, and constant perseverance. "Lightly come, lightly go" is no true education as in other every-day matters. Were we inclined to admit of any exception to this rule, the work before us would make our exception. It is not a regularly digested and scientific treatise on the subject, nor is it a popularized view of the science, but a series of original and selected remarks upon a few of the chief aspects of argumentation. Should any scholar of guiding a class, peripatetic, and a similar view of the objects of the science of reasoning take up this book, he will be grievously disappointed, but to any one who has acquired a knowledge of the methods and forms of logic the work will be found valuable. It is a very large collection of the very best specimens of argumentative discourse, and as a sequel to the

study of any of the more rigid and abstract works on the subject, would be of much service. As such we can recommend it to our readers. A logic in the sense of a systematic and classified series of directions upon "the right use of reason" and the "conduct of the understanding" is certainly in, but in the more strict and legitimate signification of the term viz. an exposition of the form and manner of all true thinking it certainly is not. To each of our readers we have studied the series of papers on the "Art of Reasoning" which have appeared in this periodical, the examples contained in them will form an agreeable and useful process upon the accuracy of the rules laid down for their guidance.

Reason and Faith, their Claims and Conflicts. By Henry Rogers. London: Longman, Brown, Green and Longmans.

This is one of the books suited to the wants of the times. Learned, acute, philosophical, and popular in its style, it is a treasure which demands the attention of every sincere inquirer into the truth of Christianity. We recommend every reader to purchase and study this most excellent little treatise. It deals in a most lucid and masterly manner with some of the prominent kinds of modern unbelief especially with the self-styled rationalism of the mythic school of the christians. The following beautiful little epigrams will illustrate the position which the author occupies.—"We should represent Reason and Faith as twin born; the one, in form and features the image of manly beauty,—the other of feminine grace and gentleness, but to each of whom is allowed a red privation. While the bright eyes of Reason are full of piercing and restless intelligence her ear is closed to sound and while Faith has an ear of exquisite delicacy on her sightless eyes she like them towards heaven, the sunbeam plays in vain. Hand in hand the brother and sister in all mortal love pursue their way through a world on which like ours, day breaks and night falls alternately. By day, the eyes of Reason are the guide of Faith, and by night, the ear of Faith is the guide of Reason. As it went with those who suffer under each privation respectively, Reason is apt to be eager, impatient, impatient of that instruction which too inflexibly will not permit him readily to apprehend, while Faith gentle and docile, is ever willing to listen to the voice by which alone Truth and Wisdom can effectually reach her."—Pp. 2, 3.

Little Henry's Holiday at the Great Exhibition. By the Editor of "Pleasant Pages." London: Heinemann and Bohn.

The Great Exhibition is now closed, but its distinguished wonders will long remain the topic of frequent fire-side conversations, and in *choix d'expressions* will become as familiar as household words. The young who were privileged to visit it will delight to be able to talk of it intelligently and those who did not see it will be glad to get a good description of its contents. To both of these classes the little book before us will be very acceptable, and we shall be disappointed if "children of a larger growth" do not read it with anxiety and pride. It has already been highly honoured by Her Majesty having directed it to be placed in the hands of the youthful members of a royal family.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. II.—THE PHILOSOPHY OF LANGUAGE.

MAN is not only a thinking being, but also a thought-utterer. The union of ideation and speech completely differentiates him from all the other animal species, and constitutes the distinguishing characteristic of human nature. "Without speech, knowledge would have little value; and without knowledge, speech would have but little weight." Thus Reason and Language are mutually reactive. "*Credunt enim homines rationem suam verbis imperare; sed fit etiam ut verba rim suam super intellectum retorqueant et reflectant.*" * "Speech is the great instrument by which man becomes beneficial to man; and it is to the intercourse and transmission of thought by means of speech, that we are chiefly indebted for the improvement of thought itself. Small are the advances which a single unassisted individual can make toward perfecting any of his powers. What we call human reason is not the effort or ability of one so much as it is the result of the reasoning of many, arising from lights mutually communicated, in consequence of speech and writing." † Without Language,—Society, Civilization, Government, Science, Philosophy, Art, Literature, Friendship, Love, Home, and Country, with all their advantages, associations, pleasures, and relation links, would be blotted from the category of human experiences. Animal gregariousness, isolation, and barbarism, would be the unpleasant destiny of humanity. To Language and Reason combined man is indebted for his progressiveness and refinement. By this man imparts knowledge to his fellow-man—communicates pleasure—awakens hope—excites to action—elicits aspirations—transports with joy, and electrifies the soul in all its manifold powers and capabilities. By it man receives a multiplied existence, and is enabled to live in the society and enjoy the converse of the illustrious of all ages and countries.

How mighty, also, are the powers of speech when wielded by intelligence and moralism! We need not listen to the Orphic fables for illustrations of the power of speech, when

"Words are with the love of truth and hues of grace
Arrayed."

Demosthenes, by the utterance of "words which were weapons," exciting the ardour and patriotism of the Grecian people, and rousing them to arms against the invading Philip—Cicero, in the senate and on the forum, swaying all intellects and governing all hearts—Peter the Hermit, kindling with frenzied enthusiasm the populations of Europe, and calling them forth to the Crusadic wars—Luther, "the solitary monk who shook the world," causing the flood-tides of passion to rush across the souls of men until they snapt asunder the fetters of the all-potent church like stubble-withes, and became free from the soul-

* "For men believe that their reason governs words; but it also happens that words retort and reflect their force upon the intellect."—*Bacon's Nov. Org., Aph. 60.*

† "*Bair's Lectures on Rhetoric and the Belles Lettres,*" p. 1.

tyranny which bound them—Fox, Sheridan, Burke, Chatham, Chalmers, Hall, Wilberforce, and Peel—are historic examples known to all. When the gigantic intellect, the flashing eye, the enthusiasm-knit frame, the living voice, and the rugged, vigorous, passion-filled periods are all united, how grand the effect—how great the influence! And even when the voice is dumb in death, Language secures to man a semi-immortality. “Language is the instrument by which Socrates brought wisdom down from heaven to earth; and Newton made the heavens themselves, and all the wonders they contain, descend, as it were, to be grasped and measured by the feeble arm of man. But its noblest benefit is the permanent transmission of thought, which gives to each individual the power and wisdom of his species, or rather—for the united powers and wisdom of his species as they exist in myriads at the same moment with himself upon the globe would be comparatively a trifling endowment—it gives him the rich inheritance of the accumulated acquisitions of all the multitudes who, like himself, in every preceding age, have inquired and meditated and patiently discovered; or, by the happy inspiration of genius, have found truths which they hardly sought, and penetrated, with the rapidity of a single glance, those depths of nature which the weak steps and dim torchlight of generations after generations had vainly laboured to explore. By that happy invention which we owe indirectly to the ear, the boundaries of time seem to be at once removed. Nothing is past, for everything lives as it were before us. The thoughts of beings who had trod the most distant soil, in the most distant periods, arise again in our mind with the same warmth and freshness as when they first awoke to life in the bosoms of their authors.”—*Brown's Lectures*, xx. Men's transient thoughts are by it enshrined in the page of Literature, and his soul still operates on the destiny of his race. To Language the historic narrative owes its precision and attractive grace, Philosophy its delicate distinctions, Argumentation its point and subtilty, and Poesy its beauty and refinement. It cannot be unimportant, then, to investigate “the Philosophy of Language.” This includes two primary questions—What is the nature of Language? and What its origin? To each of these we shall endeavour to present brief and intelligible replies. Let it be understood, however, that we do not profess, in this article, more than to compress into small space the essence of the labours of the most eminent men, by whose diligence such inquiries have been prosecuted.

THE NATURE OF LANGUAGE.—Language—a term derived, through the French “*Langue*,” from the Latin “*Lingua*,”—in its original acceptation signified the power of employing *the tongue* in the production of speech. It is now, however, more generally applied to *the whole means by which men intentionally express their ideas and emotions*. These may be thus classified:—

Language	{	Natural	{	Cries, Gestures, and Modifications of Countenance and Voice.
		Artificial		
			{	Speech.
				Painting, Sculpture, Hieroglyphics, Writing, Mute Signs, Telegraphs, Emblems, Writing, Symbols.

Language being the sign of the thoughts and emotions which pass and repass through the human mind, it becomes us to understand well the use of the representative *media which are devoted to the expression of our ideas*. This cannot be done unless we are *acquainted with their nature*. To understand this, then, we must endeavour to discover

the peculiar office and duty which it has to perform. But as speech is the most useful and necessary system of idea-signs, we shall, for the present, confine ourselves to the consideration of Word-Language.

Words have been variously defined; by Aristotle, as "sounds rendered significant by compact"—by Priscian, as "the least part of a properly-constructed sentence, understanding a part to be such in relation to the meaning of the whole sentence" in which it is employed—by the Port-Royalists, as "sounds distinct and articulate, which men have taken as signs to express what passes in their minds"—by Hobbes, as that "which may raise in our mind a thought like to some thought we had before, and which being pronounced to others, may be to them a sign of what thought the speaker had or had not before in his mind"—and by Harris, as "the smallest parts of speech." In all these we observe this great fact presented to the mind—that words are idea-symbols, the indications of impressions made upon a thinking essence; thus—

"As the vapours lie
Bright in the outspread radiancy,
So are men's *thoughts* invested with the light
Of Language."

But though the *sense* of any single word is the *idea* which it symbolizes, the *sense* of two or more words collocated syntactically is not that of the two or more ideas indicated by the terms employed, but of the ideas involved in these terms *and a relation*. "Language is not a simple collection of isolated words; it is a system of manifold relations of words to each other." It is not, therefore, the mere exponent of thought, but is at the same time, as Lord Bacon remarks, "the sensible portraiture or image of the mental processes."

The ultimate analysis reduces Language to idea-signs; but each idea is acted upon by the mind in the process of naming; therefore Language *implicitly* contains the true representation of the operations of the mentality and the development of thought. It is semi-spiritual, semi-material—at once a transient agitation of the air, and the incarnation of the human spirit in its noblest moods. The nature of Language, then, informs us, that—

- 1st. It is a system of idea-symbols.*
- 2nd. It is the product and representative of the active intelligential faculties.†
- 3rd. It is in a great measure arbitrary, and consequently depends on the will.
- 4th. Words are not reasoning, but the instruments of thought-development.
- 5th. Without power to comprehend Language—i.e., intelligence—signs would be valueless.
- 6th. The mind is qualified to make the minutest distinctions, and is capable of increasing the significancy of terms by connecting together a number of ideas and feelings in the same idea-image.

* "Seeing names (i.e., words) ordered in speech are signs of our conceptions, it is manifest they are not signs of the things themselves; for that the sign of the word stone should be the sign of a stone cannot be understood in any sense but this, that he that hears it collects that he that pronounces thinks of a stone."—Hobbes's *Computation, or Logic*, chap. 2.

† "Parrots, and several other birds, will be taught to make articulate sounds distinct enough, which yet by no means are capable of Language. Besides *articulate sounds*, therefore, it was further necessary that man should be able to use those sounds as signs of internal conceptions, and to make them stand as marks for the ideas within his own mind."—Locke's *Essay*, book iii. chap. 1.

7th. The rapidity and ease with which the mind seizes upon the significance of all these abbreviations, and combines them, is evidence of the wondrous speed of thought, and the influence of the suggestive faculties of the mind.

8th. The power of distinguishing most accurately between the nicest and most delicate shades of sensation is possessed by the sense-powers.*

THE ORIGIN OF LANGUAGE.—Few questions have been agitated more frequently among philosophers than "The Origin of Language," and few have been debated with more acrimony and warmth. Happily, the age of uncharitable debate is fast fading "into the sere and yellow leaf," and the honest advocacy of opinion is being respected. "Truth is militant, and can only establish itself by means of conflict. The most opposite opinions can make a plausible show of evidence while each has the statement of its own case; and it is only possible to ascertain which of them is in the right, after hearing and comparing what each can say against the other, and what the other can urge in its defence."† We are happy that our readers, in a recent and ably-conducted discussion in this serial, have had the question of the Origin of Language so placed before them as to enable them to form a judgment for themselves. As, however, it has been heretofore the custom, among writers on Rhetoric, to treat upon this topic, we shall, even although we may run the risk of appearing presumptuous in doing so, proceed to give a succinct analysis of the chief arguments which have been, or may be, employed, in the *pro* and *con* of this *questio vexata*—"Was Language of Human Origin?"‡

* We do not mean to say that all these several observations have been formally proven in the foregoing remarks; we merely mean that they may be legitimately deduced from them. We could have made this article less of a *rudis indigestaque moles*, had we not hesitated to employ the thoughts and illustrations which we had formerly placed before our readers—Art of Reasoning, Nos. III. and XII., to which we beg to refer, as also to the debate on "The Origin of Language," in Vol. II., in which many judicious remarks will be found.

† Mill's "Logic," Preface.

‡ For further information and more extensive inquiry upon the Origin of Language, the following list comprises, so far as we remember, the most useful works, viz.—HUMAN ORIGIN: "Lucretius' *De Rerum Naturæ*," book v.; Cicero, "*De Inventione*"; Aristotle and Plato, *passim*; Lord Burnet of Monboddo's "Dissertation on the Origin and Progress of Language"; Horne Tooke's "Diversions of Purley"; Harris's "Hermes"; Kaime's "Sketches of the History of Man," book i.; Adam Smith's "Dissertation on the Formation of Language"; Dr. Blair's "Lectures on Rhetoric and the Belles Lettres," vi.—x.; Dr. Campbell's "Philosophy of Rhetoric"; Professor Barron's "Lectures on the Belles Lettres," i.—vi.; James Dunbar's "Essays on Man," i. and ii.; Shuckford's "Connexion of Sacred and Profane History," vol. i.; Priestley's "Lectures on Language and Grammar," Works, vol. xxiii.; Locke's "Essay," book iii.; Smart's "Rhetoric"; President Des Brosse's "Traite de la Formation Mechanique des Langues"; Rousseau's "Discours sur l'Origine, l'Inegalité parmi les Hommes"; Condillac's "Essai sur l'Origine des Connaissances Humaines"; Ghibilini's "Monde Primitif"; Cousin's "Histoire de la Philosophie au 18me Siècle," lecture xx.—DIVINE ORIGIN: Winder's "History of Knowledge," vol. i.; Beattie's "Theory of Language"; Warburton's "Divine Legation of Moses"; Dr. Samuel Johnson's "Dictionary"; Webster's "Dictionary"; Archbishop Magee "On the Atonement," vol. ii.; Bishop Williams's "Boylean Lectures," vol. i.; Dr. Whitby's "Sermons on the Attributes," vol. ii.; Dr. Ellis "On the Knowledge of Divine Things"; Macgill's "Lectures on Rhetoric and Criticism"; Ripley's "Sacred Rhetoric"; Donaldson's "New Cratylus," book i. chap. 3; Chevenix Trench "On the Study of Words," Sect. i.; Bonald's "Recherches Philosophiques."

PRO.

Man may exist without the power of speech.
Men have a natural language of signs and gestures.

Man is an imitative and inventive being.
Profane history uniformly represents man as existing in the savage state.
Words appear to be arbitrary signs.
The symbolization of ideas is differently conducted in different countries.

Articulate sounds arising from irregular vibrations, variously interchanged and frequently interrupted, are easily producible, and the associative powers of the intellect could easily co-link sounds and ideas.

Man is a progressive being, and all the elements of his progress result from the exercise of his natural powers.

Gregariousness does not necessarily presuppose language, for other animals congregate together who have not verbal language.

Language being a collection of *signs*, although man possessed these signs by divine inspiration, yet he would be unable to conjoin the thing signified without Reason and Invention, and incapable of remembering the sign, seeing that the idea with which it was intended to be connected had not yet impressed the mind.

New words and new compounds, as well as new applications of words, are at present of quite common invention.

Having thus placed before our readers the chief considerations, except such as are strictly *Ethnographic*—e.g., the unity of the human race, the oneness of the original Language, &c.—we will now proceed to show how the truth seems to lie between the two extremes, and by an *eclectic* process endeavour to show the point of junction to which we may bring both opinions, and thence arrive at the most probable solution of the question at issue.

The mind of man is so framed that it must obey certain necessary laws which are by the very constitution of his nature impressed upon it. When therefore objects, whether sensationally or reflectively, make themselves distinguishable by the consciousness, they must necessarily be classified according to these mental laws. The mind, however, is not a mere passibility, but a self-energizing activity—each law, therefore, operates in producing a definite result upon a *given excitant being applied* to it. The will has the power of compelling the organs of the body to obey its behests. Let it be granted, then, that this

CON.

Language is not an accidental property of man.
The savage state is not the natural condition of man.

Language is necessary to human existence.
History presents no example of a whole nation destitute of the power of speech.

The want of Language would have made man an incongruity on the earth, as every other animal has had the proper powers necessary to its existence bestowed upon it.
The relation of words to each other—Universal Grammar—is the same in all languages, and is unprogressive.

To invent speech is a physical impossibility, as it necessarily presupposes the pliability of the speech-organs to remain till the age at which reason begins to operate.

“The Development Theory” is opposed to the “Logic of Facts.”

Man is gregarious, and a societarian compact, and even a compact regarding the significance of words, presupposes the possession of Language.

Man in the early ages of the world is displayed in profane history as being in so rude a state, as to be destitute of the power of inventing agricultural and other implements; it is not, therefore, likely that he could have invented the intricate and complex machinery of speech.

The power of expressing emotions of pain and pleasure exists in man, whether he has had occasion to exercise it or not.

All new words are compounded of, or related to, other words, either belonging to the same or another Language.

excitant is given, it must be equally evident that the articulative organs would as necessarily operate to express thought as the other portions of the body on the appearance of danger exert themselves in self-preservation. It is no valid argument against this theory, that Language is a complex and intricate system of idea-signs, apparently implying great intellectual acuteness and discrimination. It is perhaps one of the most extraordinary facts in our nature, that the most difficult things are practically perfectly familiar to us long previous to our scientific knowledge of them. Think of the "Philosophy of sight," how accurate and precise is the adherency of the visual organs to the laws of Optics!—and yet how ignorant are we of those very laws upon which the mind in exercising sight judges and acts! Is it anything more strange that the speech-organs should act in obedience to the laws of their nature, than that the sight-organs should do so? Such things become so habitual in their performance, that we act upon them without reflecting upon the reasons why we do so, and consequently we become insensible to their operations until by a more subtle and accurate analysis we are enabled to trace the processes by which our minds perform their functions.

That we possess powers and capacities for speech cannot be doubted; that we were intended to employ these powers admits of as little question; and if we believe, as we think must be done, that the laws by which these powers operate, are fixed and definite, then we cannot but conclude that upon the proper stimuli being applied they must have spontaneously developed themselves. The world, with all its magnificences, beautiful sublimities, and conveniences, lay around Man, soliciting him to become acquainted with their secrets; his co-mates in existence invited him to companionship; could he fail, under such propitious circumstances, to fill the air with music, and laden it with the sweet burden of his thoughts? As naturally as the eye distinguishes distance, or the eye-lid close to avoid a too great glare of light—as naturally as the ocean-waves rock to and fro by the agitation of the wind—as naturally as the sun mirrors itself in the streamlet—mineral and saline bodies, in certain circumstances, assume the crystalline form—so naturally do the vocal organs, in obedience to the laws impressed upon them, produce the thought-signs called sounds. This latent power, the sufficient excitancy being supplied, necessarily manifested itself. In the sense, therefore, of adaptation and adjustment—pre-arranged and pre-established creation-interwoven law, "Language is of divine origin. A God-furnished and all-adequate lexicon, at least, there is good reason for believing was not; but rather that as man's idea-receptive power increased, so did his stock of verbalisms, and that in this sense "Language is of human origin."

This seems to be the view taken of this subject in the following exquisite sonnet Hartley Coleridge, with which we beg leave to conclude this dry, rambling, and discursive article:—

"What was 't awakened first the untried ear
Of that one man who was *all* human kind?
Was it the gladsome welcome of the wind
Stirring the leaves that never yet were sure?
The four mellifluous streams that flowed so near,
Their lulling murmurs all in one combined?
The note of bird unnamed? The startled hind
Bursting the brake in wonder, not in fear

(Of her new lord? Or did the holy ground
Send forth mysterious melodies to greet
The gracious pressure of immaculate feet?
Did viewless seraphs rustle all around,
Making sweet music out of air as sweet?
Or his own voice awake him with the sound?"

Philosophy.

IS HOMŒOPATHY TRUE IN PRINCIPLE AND BENEFICIAL IN PRACTICE?

AFFIRMATIVE ARTICLE.—II.

We have on more than one occasion, in the pages of this magazine, expressed our disapproval of the system, still prevalent, of condemning new theories *merely because they are new*, and without any regard to their real claims to merit. We consider such a course unworthy of any one pretending to be an earnest inquirer after truth.

On the occasions to which we refer, we have generally made more particular allusion to discoveries in mechanical science—as the steamboat, locomotive engine, and electric telegraph—all of which brought their inventors into ridicule, and were, so long as disbelief and prejudice could hold out, designated “absurd impossibilities.” But mechanical inventors have not been the only recipients of such abuse. HARVEY, who, after laborious investigation, propounded his theory of the circulation of the blood; and JENNER, who, after equal painstaking, discovered vaccination to be a preventive of that direful scourge, the small-pox, were equally scouted as “vain enthusiasts,” and by members of their own profession too! How true it is that great men are ever in advance of their age! The medical profession, by reason, we suppose, of some strange infatuation, notwithstanding their known intelligence, seem to be remarkably incredulous. Look at their treatment to the *Phrenologists*, and their dogmatic opposition to the *Mesmerists*, neither of whose sciences can they disprove! Ought they not rather, by virtue of their profession, to be the first to avail themselves of all new curative agents, when proved to be such beyond the shadow of a doubt, and give the public the benefit? Instead of which, they allow, by their neglect

and prejudice, these advantages to be seized upon by inexperienced and uneducated persons, who impose upon the public, abuse the science they advocate, and finally discourage scientific discovery! After what we have said of the past, we are not surprised, although we may regret, to find that the profession (taken as a body) are equally deadly and determined in their opposition to Homœopathy as they have been to the sciences before enumerated. But let us proceed to look a little into the merits of the question for ourselves.

Homœopathy, as your medical correspondent stated in the last number (and we welcome him to our ranks), is comparatively a new science. Its primary claims seem to lie in its advocacy of the adoption of simplicity in the place of complexity; moderation in the stead of useless profusion; and comparative certainty in the place of almost proverbial uncertainty.

By simplicity we mean that the Homœopathic theory embraces some settled line of action—its principle of cure (*similia similibus*) applies to all bodily disorders—for that being to administer to the suffering person what would be most likely to produce similar symptoms in a healthy person, the energies of the practitioner become concentrated in one object, although the means by which he may accomplish it are not, as some would have us believe, restricted, because he is perfectly at liberty to select from all known means that most likely to suit his purpose, and directly he succeeds he will have visible proof of his success by the relief afforded to the patient. Under the old system of medicine no such immediate certainty of result exists.

By moderation in the stead of profusion, we mean that the Homœopathic practitioner applies only just so much of his remedy as is absolutely necessary to *create the test*—he being always careful that in the event of his judging wrongfully and administering a non-curative agent, it shall not be in sufficient quantity to do further injury to the patient; and knowing, on the other hand, that when he has once discovered the proper agent, he can administer it in any quantity desired. How different is this from the *sluicing system* now in fashion!

We are aware that after the long prevalence of the old system of drugs and drafts, pills and doses, “to be taken every four hours”—all of which have to be *paid for* in the same extravagant style as they are supplied—it is only natural that some times should pass before the heads and the *pockets* of the profession would become reconciled to such a radical change as that which must follow the general adoption of the Homœopathic system. The English public, however, are not niggardly, and would, we think, be more disposed to pay well for speedy and pleasant cures, than for long tedious and unpleasant ones.

We are far from seriously believing that the profession are actuated alone by selfish motives. The public would be too discerning to tolerate a combination on such grounds. The plan heretofore pursued has been rather to cast ridicule and discredit upon the system. They cannot, *dare not*, say that no cures have been effected under its treatment—but do ascribe the cures to change of diet, change of air, &c.; while, as it has been amusingly remarked, some of the patients *could not eat*, and others never left their room while under Homœopathic treatment!

But to think of cures being effected by medicine administered in any other mode than that which has descended from Hippocrates and Galen! Oh, foul and miserable slander! Yes, it is the minuteness of the doses administered that has formed the stronghold for Homœopathic opposition, as if healing medicines were to be administered in *pailfuls* or not at all! But is the Homœopathic practitioner bound down to administer “so much and no more?” We think not. The principle is to test with the *smallest possible quantity*, and then to administer *as the particular case may require*. We have

no direct authority before us on this point, but we have one on which we place considerable reliance, because it comes from an impartial source. The “National Cyclopædia” (Art. Homœopathy) says hereon:—“The extremely minute quantities of which the remedies are administered seem to form a marked difference between the Homœopathic and all other schools of medicine. *The Homœopaths, however, assert that this is merely a point of practice to be determined by the physician at the bed-side of his patient*, and that, in the application of the Homœopathic principle to the treatment of disease, it was soon found that remedial agents given in the doses usually employed, acted too energetically upon a frame already predisposed to their influence, by the affinity existing between their medicinal effects and the morbid signs of the disease; and hence a gradual diminution was made in the quantity of the medicine exhibited, in order to approximate to that amount which might exert its full curative power, without aggravating the sufferings of the patient by an excess of medicinal action. The result has been the general adoption among Homœopaths of the minute dose at present in use, which perhaps more than any other cause, from its discrepancy with generally received opinions, has prevented any impartial investigation into the principles of the new system by the profession at large.” It may be so. But where is the reasonableness of such a course? Why not reject the indication of the mariner’s compass because of the minuteness of the indicator—the needle? Or why not denounce as absurd and impossible the working of the electric telegraph, because of the minute and invisible nature of the agent employed in effecting its operations? Surely one would be as reasonable as the other! Do our opponents forget that even the slightest touch, or still more remarkable, even a breath of air, is sufficient to convey and spread the direst contagion? Why, then, should not an equally minute application supply a remedy? It may be that the exact “why and wherefore” is not yet fully understood; but is this any reason for an unqualified disbelief or denial? We believe it is not yet understood what it is that affords to the hound the extraordinary power of tracing the footsteps of his master for miles and hundreds of miles, and even for

many days after the journey was accomplished; but there stands the fact, alongside with many others no less remarkable, and also no less true.

The medical science itself, in the every-day practice of that principle for the propounding of which we have said Jenner suffered abuse and persecution—we mean vaccination—affords a far more powerful illustration of the truth and efficacy of the homoeopathic mode of treatment than any other we could furnish. The merest particle of matter conveyed in the needle point is sufficient to affect the whole system, and produce the desired result. "A little leaveneth the whole lump."

We shall not hunt over the whole cyclopædia of medicine to rake up cases to submit to our opponents, who are in fact themselves better acquainted with them, but we would ask, Is it not a well-known fact that mercury, which produces a certain kind of dysentery, will remove a similar kind? That Peruvian bark will cure a kind of intermittent fever, by virtue of its tendency to produce a similar kind? Also that arsenic, and many other medicinal agents, effect like results?

Let such facts be well considered. The aries reflect before they condemn.

C. W., Jun.

NEGATIVE ARTICLE.—II.

PERMIT me, gentle reader, to inform you that I was much pleased with the announcement of the intended discussion of the merits of Homoeopathy in this journal, and that on receiving the January number, I turned with some aridity to the affirmative article, in the hope of there finding a case satisfactorily made out in favour of the tasteless, infinitesimal globules. Though gifted with a pretty robust constitution, I have, in my time, been forced to swallow many a nauseous dose of "rhubarb, senna, and other purgative drugs," the bare mention of which bring up to the mind anything but pleasant associations. Coming, therefore, to the discussion of this question with a bias in favour of the system I was glad to recognise, in the writer of the affirmative article, a Doctor of Medicine, or to mean standing in the Homoeopathic world, judge, however, of my disappointment, in going through his article, to find that it left the matter precisely where it previously stood. But if disappointed at the arguments there brought forward in favour of Homoeopathy, I was not a little astonished at its claims as there put forth. I was aware that it professed to cure diseases on an improved principle, and I had been accustomed to think that its collateral advantage would be to render medicine pleasant, making the bitter sweet, and thus lessening the sorrow of infancy and age; and further, that it would so reduce the bulk as to render a snuff-box capacious enough for a medicine chest, and thus save the poor apothecary the trouble of displaying

"About his shelves

A beggarly account of empty boxes,
Green earthen pots, bladders, and rusty seeds,
Remnants of packthread, and old cakes of roses,
So thinly scattered, to make up a show."

This much I expected; but in my simplicity I never even dreamt of being told that this said Homoeopathy was capable of "effecting the ultimate cure and emancipation of mankind from bodily ills, and consequently from mental disorders which arise out of them as sympathetic results." That the present is an age of progress we have been assured by "a thousand and one" voices; but how shall we designate that age in which Homoeopathy is to be universally practised? It would seem, if these things be so, that there is, indeed, "a good time coming" to suffering humanity; but, alas! it is still to come. I happen to number, among my friends, many warm adherents to the system which I feel bound to oppose, but I can discover in them no symptoms of an approach to an Edenic state of "emancipation" from the pains and penalties of nature.

That "*Homoeopathy will in no case do positive injury*" is not saying a great deal in its favour; and yet it is this plea that commends it to the attention of many. That in many cases its do-nothing globules are harmless, I believe; and this is admitted by many Allopathic physicians. Dr. Cross says,* "The instances in which it can be practised with impunity, are those imaginary

* "*The Physiology of Human Nature.*"

maladies wherein it cannot do harm, either through its own feeble efforts, or by taking the place of more efficient means. In such cases it may, indeed, be designated the art of amusing the patient, while nature cures the complaint, if complaint there be beyond the mere fancy of complaining. Whenever active and urgent disease, however, is to be dealt with, any dependence upon such fallacious means is not only unavailing, but mischievous; inasmuch, as being powerless itself to contend with any serious malady, it yet usurps the place of any really efficient medicinal treatment."

That the principle of "*Similia similibus curantur*" is not a sufficient basis for any system, has, I think, been satisfactorily shown by "Vinculum." If Homœopathists object, let them at once submit their system to the test suggested some time ago by a respectable journalist:—"We offer a method of satisfying us, which we doubt not will be at once as successful with the public as ourselves. Let the Homœopathists select fifty healthful men, and in the use of fifty given medicines, let them *produce* in each of these fifty the separate malady of which that medicine is the professed *cure*; let this be done, and we shall at once believe that such medicines can cure the fifty individuals upon whom the said maladies have come from natural causes. Let this course be followed, and it will command our entire confidence, and we think that of mankind generally, in the soundness of the principle that 'like is cured by like.'" Now what say Dr. V. and his friends to this? Is not the course recommended a fair one? and if fair, ought it not to be carried out? Now, no shuffling, gentlemen; bring your system to the test, or we shall be compelled to believe the reports of the failure of your experiments, when conducted by impartial men, and shall say, *You do not, because you dare not.*

But then we are pointed to "the proofs of the efficacy of Homœopathy" which are said everywhere to abound. Indeed! then you ascribe many wonderful cures to the application of your system; but are you quite sure that they result from it? You have not forgotten the important law in philosophy, not to assume a new cause when *known ones* will explain a fact. May not *the cures that you attribute to Homœopathy result merely from the efforts of nature to*

recover her lost ground? If this is *never* the case with other means, or how do you account for the wonders said to be wrought by Morison's pills, Holloway's ointment, and much more, by the olive oil and "laying on of hands" of the Mormonites? If, then, this is the case with other *methods*, may it not be sometimes the case with yours? especially as one of its principal characteristics is—to use your own words—that "it gives the system more time to rest and *recover itself undisturbedly.*" And if, then, it be confessedly thus *sometimes*, may it not be thus *frequently*?

Another plea urged for Homœopathy, suggests a *rationale* of many of its "cures." It is said to lead the physician "to insist upon his patients attending more particularly to the rule of diet." Ah! how many disorders arise from neglect here. The way to many a man's head is, in more senses than one, through his stomach. Yea, further, from disarrangement in the said organ go forth many prejudicial influences to *every* part of the system. Let the cause be removed, and then the effects will either cease or be weakened. Hence the importance of dietary regulations, and the beneficial effects of their due observance, which Homœopathists know how to appreciate. I may adduce here a case in point. Dr. Jennings was a physician of transatlantic celebrity, and being convinced of the importance of attending to regimen, dispensed with all medicine throughout a very extended practice, but nevertheless amused his patients with bread pills and bottles of good spring water coloured. He was successful to an amazing extent, and outstripped all his competitors. "Fever in all its forms, and whatever else came in his way, he met and battled with a bread pill and coloured water, and the region rang with the praises of Dr. Jennings!" I hope my Homœopathic friends will forgive me if I place their potent globules and bread pills on a par. A strong argument in favour of the belief that the Homœopathic "cures" depend more upon regimen than anything else, may be drawn from some of those statistics to which Dr. V. refers to with such satisfaction.

It is curious to notice the proportion between the "in" and "out" patients reported as cured in the Hahnemann Hospital, London. Upon the in-patients a strict dietary is of

course enforced, while to the out-patients it can only be recommended. That it is not generally adopted I have had many opportunities of ascertaining. How this affects the proportion of cures we shall see. The following is an extract from the first report of the above-mentioned institution, which was presented to a meeting of subscribers held April 3rd, 1851:—

During the five months it has been in operation the patients have amounted to 1,569 persons, viz.:—

Out-patients (since 16th Oct.).....1,485
In-patients (since 1st Nov.), chiefly only
with twenty beds ready..... 84

1,569

Of whom—

	Out.	In.
Have been discharged, Cured ...	347	40
" " Improved	206	18

Total..... 553 58

Unaltered.....	33	7
Under treatment	529	14
Result unknown	252	
Died.....	17	2

The number, then, of in-patients (or persons upon whom a strict dietary has been enforced) reported to have been "cured," is nearly *one-half* of the whole, and those reported as "improved" nearly *one-fourth*; while the number of out-patients (or persons to whom a strict dietary has only been recommended) reported to have been "cured," is not *one-fourth*, and those "improved" not *one-seventh*. These are significant facts, and speak volumes.

The large number of cases reported as only improved, and significant of the slow progress of Homœopathic patients, is favourable to the hypothesis that their cures are the result of nature's unaided and gradual operations.

But if, after all, it can be shown that *bona fide* cures have been effected by medical practitioners of this school, the question may be put, Have they been effected on Homœopathic principles? For while Dr. V., in one part of his short paper, declares his pet system to be "*the only real method of effectually treating all disorders to which the animal organism in general is subject*," he a

few sentences further on admits that "Homœopathic practitioners reject no *reasonable* method of treatment—no method by which they incur *no risk of unforeseen mischief*; they use all these medical auxiliaries," viz.: "Hydropathy, Mesmerism, Galvanism, &c." Do they not in acute cases frequently apply to Allopathy? It is reported that they do; and a writer in *Tait's Magazine* for December asserts that he knows an eminent Homœopathic physician who always has his children treated Allopathically.

These are difficulties that must be removed, and apparent inconsistencies that must be cleared away, before I can be at one with my Homœopathic friends.

Perhaps I cannot better conclude this paper than with the following pungent extract from the *London Medical Examiner*:—

Faith and proper diet will remove many disorders. We knew a blacksmith who sometimes cured ague by making his patients swallow a piece of paper upon which he wrote some "dog's latin" a few hours before the expected paroxysm. But our Homœopathic friends would probably attribute the cure to the gallate of iron in the ink. Hohenloe miracles, Morison's pills, Animal Magnetism, and Hydropathy, are on the decline, and infinitesimals are in the ascendency; like other quackeries it will have its day, and then give place to some fresh delusion. Dr. S. Johnson used to say, "that if a man were to get upon a tree and preach with his head downwards, he would have a large congregation." And as with theology so with physic, the more absurd the doctrine the more numerous are its disciples. But how useful this science of Homœopathy would be if fully carried out: let a man try the ten-millionth part of a mutton chop for his dinner, or the billionth part of a bottle of wine, and then consult his feelings. Dr. James Johnson, we think, suggested when Homœopathy was first on the tapis, "that if a bushel of Epsom salts were put into the Thames at Richmond, all the inhabitants of London might be physicked." We should like to see the effect of the infusion of a grain of common sense into 500 members of the House of Commons; we might then get efficient medical reform, and our legislators might agree to the axiom, "That next to a man's spiritual welfare, his bodily health is of the most importance."

L. G. G.

History.

CAN THE APOSTOLIC ORIGIN AND NATIONAL INDEPENDENCE OF THE
BRITISH CHURCH BE PROVED?

NEGATIVE ARTICLE.—II.

MR. EDITOR,—The introduction of discussions of historical questions in the pages of the *British Controversialist* is, in my opinion, a very important feature; and I doubt not that it will prove a source of much interest and instruction to all, and especially to the young.

That it was the privileged lot of Great Britain to receive Christianity, and some of her attendant blessings, at a very early period, we are all agreed, but as to who was the first publisher of the "glad tidings" is a matter of dispute. J. B., in the affirmative article, maintains that it was one of the apostles; and, further, that St. Paul was the individual. We purpose, then, briefly to examine the testimonies which he brings forward in evidence, and to show how far they fall short in substantiating his position. The assertion that "the fathers inform us, in general terms, that it was the apostles personally" who founded the church in Britain, if admitted, would not prove that Britain was ever favoured with their presence. In popular language, leaders and employers are said to accomplish objects, when those objects are secured mainly by their adherents or servants. On this principle, a few months ago, the air was rent with the cry, that the Pope had introduced a Romish hierarchy into England, although no one understood by that that we had been honoured by a personal visit from "his Holiness!"

Far be it from us to attempt to undervalue, in historic researches, the testimony of contemporary writers, whether friends or foes, but we cannot place much reliance upon the record of events made some centuries after the events themselves had transpired, and a knowledge of which could only have been preserved by tradition—and mark, that kind of tradition which all true Protestants believe to be eminently untrustworthy. And is not this the kind of testimony upon which J. B. builds his theory? Jerome flourished in Palestine in the fourth

century; Eusebius was bishop of Cæsarea in the fourth century; Theodoret was bishop of Cyprus in the fifth century; and Venantius bishop of Poitiers in the sixth century. These, then, are J. B.'s witnesses living thus far distant from the event concerning which they are supposed to testify, and far distant from the place where the event was supposed to have taken place. But what, after all, do these witnesses assert? Nothing very definite. Theodoret, we are told, asserts, that "the apostles persuaded even the Britons to receive the laws of the crucified Lord;" and Jerome says, that "Paul preached the gospel in the western parts." Well, with the consideration of these statements, conflicting ones should be taken, as well as popular belief. "The first publication of the gospel in Britain has been attributed to James, the son of Zebedee, whom Herod put to death (Acts xii. 2); to Simon Zelotes, another apostle; to Aristobolus (mentioned Rom. xvi. 10); to St. Peter &c., by some few legendary writers, who are cited by Ussher, *Eccl. Britann. Primordiales* cap. 1. But, rejecting these accounts, William of Malmesbury, and after him many other monks, maintained that Joseph of Arimathea, with twelve others, were sent from Gaul by St. Philip into Britain, A.D. 43; that they were successful in planting Christianity; spent their lives in England, had twelve hides of land assigned to them by the king at Glastonbury, where they first built a church of hurdles, and afterwards established a monastery. By maintaining the truth of this story the English clergy obtained the precedence of some others in several councils of the fifteenth century, and particularly that of Basil, A.D. 1434."*

J. B. quotes the intention of the apostles

* "Mosheim's Ecclesiastical History," Second Century, chap. i. note 4.

Paul "to journey into Spain," recorded *Eccl. iv.*, to give plausibility to his opinion. But is our friend not aware that it has been a disputed point with bible students, as to whether the country there referred to is the same as the one known to us by that name? Without entering upon that dispute, it should ever be remembered that there exists no evidence to prove that the apostle was ever able to carry out his intention! Further remarks here would therefore be unnecessary.

But, Mr. Editor, had every position taken by J. B. proved unassailable, I maintain that he would have failed in making out a case sufficiently strong for his purpose—he might have shown that the Apostolic Origin of the British Church was *probable*, but he would not, as required by the question, have "*proved*" it actual.

Here I might lay down my pen, but wishing to upbuild as well as destroy, I would suggest, for the consideration of J. B. and your readers generally, the following, as a more *probable* account of the introduction of the gospel to Britain, than the one on which I have been animadverting. There is an ancient British history, called the *Triades*, of the Isle of Britain, and written in the Welsh language. These British records are of undoubted credit, and state, that the famous British king, Caractacus, and his father, Bran, after a war of nine years in defence of their country, were defeated; and in the year A.D. 52 or 53, were carried captive to Rome, where they were detained seven years. At that time the gospel was preached in the imperial city, and Brân, with others of his family, were made converts to the faith of Christ. After seven years, they were permitted to return to their native land, and were instrumental in the early preaching of the gospel among their countrymen. On this account Brân was long distinguished as one of the *three blessed sovereigns*, and his family as *one of the holy lineages of Britain*. Christians from Rome actually accompanied the royal liberated captives. They are supposed to have been all preachers. They were the means of turning great numbers of the Britons from paganism to Christianity. Their names are

preserved. One was called ILID, it is supposed an Israelite; and the other two were CYNDAY and ARWYSTLI ILEN, probably Gentiles.

One cannot help asking, What is the object of J. B. in introducing these views? Seeing that he lays his foundation with such care, surely he must have an important superstructure to rear. What, then, is that superstructure to contain? Are we not right in surmising that one of its "holy things" will prove to be the doctrine of the apostolic succession of the clergymen of the Established Church of England, and the consequent scripturality and authority of that church? If so, we would remind him and his friend, in the words of an *Edinburgh Reviewer*, that "It is impolitic to rest the doctrines of the English Church on an historical theory, which, to ninety-nine Protestants out of a hundred, would seem to be more questionable than those doctrines. Nor is this all. Extreme obscurity overhangs the history of the middle ages; and the facts discernible through that obscurity prove that the church was exceeding ill regulated. We read of sees of the highest dignity openly sold—transferred backwards and forwards by popular tumult; bestowed sometimes by a profligate woman upon her paramour; sometimes by a warlike baron on a kinsman, still a stripling. * * In our own island it was the complaint of Alfred that not a single priest, south of the Thames, and very few on the north, could read either Latin or English. And this illiterate clergy exercised their ministry amidst a rude and half heathen population, in which Danish pirates, unchristened, or christened by hundreds, on a field of battle, were mingled with a Saxon peasantry, scarcely better instructed in religion. The state of Ireland was still worse: '*Tota illa per universam Hiberniam dissolutio ecclesiasticæ disciplinæ—illa ubique pro consuetudine Christiana sæva sub introducta barbaries*,' are the expressions of St. Bernard. We are therefore at a loss to conceive how any clergyman can feel confident that his orders have come down correctly."

Waiting the further development of J.B.'s theory, I remain, Mr. Editor, yours faithfully,
SCRUTATOR.

AFFIRMATIVE ARTICLE.—II.

THE "National Independence" of the British Church now claims our attention. We have already seen that the church in our favoured island was founded by St. Paul, and now our object is to show that this was the commencement and nucleus of that church, which, although it has experienced many vicissitudes, continues to the present day. That the foundation thus laid did not decay, but that a glorious superstructure was raised upon it, we have the undoubted testimony of the christian fathers from the apostolic age downwards.

Tertullian, a celebrated Carthaginian of the second century, in his tracts against the Jews, when enumerating the nations which had embraced Christianity at that time, thus refers to *Britain*:—"In whom else but that Christ, who is already come, have all these nations believed? all the borders of Spain, the divers nations of Gaul, and those places of *Britain* into which the Roman arms have not yet been able to penetrate, but which are subject to Christ." An obvious inference from these words is, that Christianity must have been well established in the more civilized and accessible portions of Britain, ere her influence could be felt in the wildest regions. In the next century, Origen, A.D. 230, triumphantly sums up the victories of Christ in these words:—"The power of our Lord and Saviour is both with those who, in *Britain*, are separated from our coast, and with those in Mauritania, and with all who under the sun have believed in his name." There is concurrent witness that during this century the church in these isles was not only existing, but highly flourishing.

In the fourth century (A.D. 303), under the emperor Diocletian, commenced that fiery trial, the last of the ten persecutions. Gildas, and Bede, after him, tell us, in glowing language, of the havoc it made in Britain. "Then it was," say they, "that Britain enjoyed the highest glory by her devoted confession of God, and great was the number of her martyrs." This persecution terminated with the accession of our christian countryman, Constantine, to the empire. "Now," say our authors whom we have just quoted, "the persecuted Christians return from the

woods and mountains and dens of the earth, re-establish the faith, build again the demolished churches, erect basilicas of the saints and martyrs, and, setting up again in triumph their victorious standards, celebrate their sacred rites with clean hands and hearts."

The empire had now become christian; general councils were common; and it must not be forgotten, that three of the bishops from the principal cities then in England, representing their brethren and the church of the island at large, had seats in, and subscribed to the canons of, the councils held in Europe and Asia during this century. At one of these (Nice) we must bear in mind that the independence of all national churches was settled, and all foreign jurisdiction excluded, by canon law.

When the church was freed from persecution, she was soon exposed to the desolating ravages of heresy. Early in the fifth century the British Church was assailed by the fatal heresy of Pelagius, who is generally called a Welshman, but was probably Scotus, i.e., a native Irishman. This called forth the energies of native bishops; but it was not until the commencement of the sixth century that the "heresy was utterly dissipated and destroyed," and then chiefly by the eloquence of St. David, bishop of *Minevia*, afterwards primate of the church in Wales. At this period, St. Jerome, speaking of the purity of the faith of the British Church, puts it on a par with that of Jerusalem. St. Chrysostom refers to the British Church in several places, and in such a way as shows that the faith received by it from the apostles continued not only pure and sound, but flourishing, in his own time, the fifth century.

We now arrive at the sixth century. Britain had become independent. The Caledonians, celebrated in the wars of Agricola, disappear, and their place is supplied by the Picts and Scots. The Romans had not taught our ancestors the art of warfare, and Vortigern found it necessary to call to his aid a band of predatory Saxons. These pirate savages soon succeeded in repelling the attacks of the Picts and Scots, and then turned their arms against their employers.

was misery and desolation on many fleeing to the mountains.

In the year 587, within ten arrival of Augustin, the bishops and York occupied their respective 96 St. Augustin landed in Kent, and Ethelbert's permission to preach at the church of St. Martin's, Canterbury, of the Romans. The king of Kent chief of the Saxon sovereigns at whom all were in some measure here he found a *christian* congregation among its members no less than Ethelbert's *queen*. Dr. Lins that *Ethelbert* was not ignorant of the christian religion. His — "Ethelbert could not be unacquainted with the christian religion. It is by the belief of the *majority* of the *peoples* in his dominions." This is a mission from a Roman Catholic

altogether bears out our statement is flatly contradictory to the of many Romish authors, who say the people were *Pagans*. After consecration at Arles, he held a council with a view of accomplishing a union of the British bishops; but he was refused. We must remember they were not to act *with* him, not *under* him.

His last words on separating with the bishops were:—"I foresee that you will have peace with *brethren*, you shall have peace with *foes*; and if you will not take this way of life to the English, you shall have *deadly vengeance at their hands*."

His prediction had a bloody fulfilment. Some years afterwards, 1,200 priests and monks of Bangor were slaughtered. We hope Augustin was true to this design, in order to be true to the British bishops for refusing to submit to his authority. The learned

and the authority of Bede ("who tells as he well could that tendeth to the honour of the *British Church*"), and many writers, prove that the extent of Augustin's preaching in the conversion of the Saxon and other inhabitants, was very

comparisons to that of the *native*. At the time of Augustin's arrival, the island of Britain was divided into four speaking different languages, viz., the *Welsh*, *Picts*, *Scots (Irish)*, and *Angles*,

including under that common term the *Saxons* and *Jutes*. Of these, the Britons, as we have already seen, had embraced the christian faith in the times of the apostles; and at the very time of Augustin's mission, seven bishops, and a proportionate number of clergy, with an archbishop, presided over the church of Christ in this island. If Augustin brought the christian faith to any of the German settlers in England, it was the Jutes, who inhabited the kingdom of Kent; but even among them he cannot be said to have laid the foundation, for Queen Bertha had her bishop *before* his arrival. All must confess that he "*built on another man's foundation*," and *watered the seed already planted*.

We have thus shown that the British Church declared her independence, and that Augustin acknowledged it with a *threat*. We will now take a hasty glance at her protesting character onwards to the Reformation. In 794, Charlemagne summoned a great council of *British* and other bishops, at Frankfort, when the decrees of the second council of Nice, notwithstanding Pope Adrian's countenance, were "rejected," "despised," and "condemned." During the Danish invasion, which spread over 200 years, the British Church experienced sad oppression. The Danish monarchs occupied the throne for twenty-eight years, after which the ancient family were restored in the person of Edward the Confessor. He resisted "Pagal aggression." We have now arrived at the *darkest* of the "dark ages." The Norman rule lasted eighty-eight years. Each and all of its sovereigns, more or less, protected the *British Church*. Henry II., being resolved to establish his independence of the Pope, called a council, A.D. 1164, which agreed to the sixteen articles called the "Constitutions of Clarendon." The "fathers of liberty" were excommunicated by the Pope for compelling John to sign the *Magna Charta*. The barons, in the reign of Henry III., sent ambassadors with a letter to lay the grievances of the *British Church* before the council of Lyons; this letter concluded with the following bold and resolute expressions:—"We can no longer, with any patience, bear the aforesaid oppressions; which, as they are detestable to God and man, are intolerable to us, neither will we any longer endure them." Edward I.

resisted the authority of the Roman see; and although he was threatened with excommunication, he carried his point.

Edward II. positively refused to do homage to the Pope for his kingdom. These several facts plainly show that Englishmen *never* lost sight of their *independence* in church or state. The reign of the third Edward was ushered in by the "morning star of the Reformation." It has been stated by some writers, that the zeal which this great man displayed was occasioned by nothing else than the loss of the warden-ship of Canterbury Hall, Oxford, of which, they say, he was first deprived by Archbishop Langham, and finally by Pope Urban V. Light, however, is thrown upon these matters by the discovery of the fact, that the warden of Canterbury Hall and the Reformer were *two distinct individuals*! The *statute of premunire*, passed in 1393 (reign of Richard II.), gave such a blow to the Church of Rome in this land, that it daily decayed till its final destruction. The *first Tudor*, in consequence of the rapacity

of the Papal see, her doctrines, errors, and corruptions, commenced the Reformation which Wickliffe had prepared the way for. God frequently causes good to come out of evil. This is exemplified in the character of Henry VIII. A Romanist writes of him:—"The last eighteen years of his reign was one continued scene of rapine, of insult, sacrilege, of bloodshed, and oppression. Under the tortures of a guilty conscience and a rotten constitution, he died, in 1546. Yes, he died a Roman Catholic, and left, by his will, an amount equal to £600 per annum for the recital of masses to get his soul out of purgatory! Thus, then, by throwing together these testimonies, we find that the British Church was in turn a *prosperous* and *independent* church; a persecuted church maintaining her *independence*; a church *disseminated* in councils; a church continually *protesting* against all usurpations and encroachments, until the period of the Reformation, when she succeeded in casting off every shackle, and broke forth in fresh beauty and splendour. J. B.

Politics.

OUGHT THE JEWS TO BE ADMITTED TO PARLIAMENT?

AFFIRMATIVE ARTICLE.—II.

THIS is a question continually agitating the minds of the people of the United Kingdom of Great Britain and Ireland. All men, of all religious sects, and of all political opinions, take an equal interest in this much controverted question—Ought Jews to be admitted into the legislature of these realms? Twice has a Jew (Baron Lionel de Rothschild) been returned by an enlightened London constituency to represent its views in Parliament; and upon the last contest for the representation of the important borough of Greenwich, Alderman Salomons, a Jew, was returned by a very considerable majority. Four times have the House of Commons sent up a bill to the House of Lords, for the removal of the disabilities which prevent the Jews admission into Parliament, and four times have the House of Lords rejected that bill; by these means nullifying the elections

of two large constituencies, and stultifying the opinions of the great body of the British representatives.

We are naturally led to inquire into the cause of what, at first sight, seems a curious circumstance, viz., that a body of British subjects in one house should, upon four different occasions, decide upon the propriety of emancipating the Jews from their present remaining disabilities, and that another body, assembled under another roof, should as many times assert its conviction of the impropriety of so doing. But the anomaly ceases when we take note of the different classes which constitute the two assemblies. The Lower House is chiefly composed of country gentlemen, retired military and naval officers, barristers, and merchants, together with a fair sprinkling of the scions of nobility; but this latter class forms only a small

section of the whole house. No clergyman of the Church of England, or priest of the Roman Catholic Church, is found within its walls. While on the other hand, the Upper House is composed of peers of the realm, and of the lords bishops and archbishops of the Established Church. Can we be surprised such an assembly as the House of Lords should throw out a bill for the admission of Jews into Parliament? The Jews have ever been regarded as an alien and degraded race. Can we be astonished, then, that the peers, so fond of their hereditary honours and titles, should wish to exclude the Jew from Parliament? They have the foresight to perceive, that if once the doors of the Lower House of Parliament are thrown open to the Jew, the time will not be far distant when he will be able to rank with, and take his seat by the side of, the noblest of the land; that their own hereditary titles and coronets will no longer grace alone christian heads, but adorn the hitherto degraded Jew, who has deserved sufficiently well of his sovereign and of his country. Can we be surprised again that the spiritual lords of the Upper House, the heads and rulers of a christian church, should be opposed to the admission of the Jew into Parliament—the infidel Jew, who denies their religion, and regards it as an imposture, a cunningly-devised fable? Like the temporal lords, they too anticipate the time when the unbelieving Jew shall be permitted to oppose them on church questions, not only in the House of Commons, but also face to face on the floor of the House of Lords. And their religious prejudices naturally incline them to deny the policy and the propriety of allowing such men to join in legislating for a professedly christian community.

We must admit these prejudices are very natural, but at the same time we deem them groundless and unreasonable, and ought not to be allowed to interfere with justice. Perhaps these remarks may be deemed a digression from the immediate subject of inquiry; yet we think they are not entirely so. They at least hint at some of the grounds of objection against the Jew, and in a measure prepare the reader for the consideration of the question. We will now, however, proceed more systematically to *prove that the Jew has a right to be admitted into Parliament.*

The Jews, as we all know, were a people inhabiting the land of Judea, the remnants of whom, when Jerusalem, their chief city, was taken, their temple destroyed, and their territory laid waste by Titus, the Roman emperor, A.D. 70, departed from their native country and distributed themselves over the then Roman empire, penetrating also to the Ganges on the east, and into Gaul on the west; and who finally settled, not only in every European state, but spread themselves nearly over the whole habitable world. Among other European states they found their way into the British isles, where they were treated with the greatest cruelty and degradation; they were banished in the reign of Edward I., and were not again re-established in this kingdom until about the time of the Restoration. During the latter part of the last century, the condition of the Jews in Europe began to engage public attention, and plans for their moral and political improvement were discussed and carried into execution. In our own country, a bill enabling Jews to prefer bills of naturalization in Parliament without receiving the sacrament, was passed in 1753, but repealed the next year. In May, 1830, an attempt was made in Parliament to remove the civil disabilities affecting the Jews, but was opposed by the ministry, and the question was lost. But an act was passed, and received the royal assent, on the 31st July, 1845, entitled, "An Act for the relief of persons of the Jewish religion elected to municipal offices," 8 and 9 Vic., c. 52, by which a declaration, to be taken by the Jews upon admission into municipal offices, is substituted for that prescribed by 9 Geo. IV., c. 17. And in the following session of Parliament another act was passed, entitled, "An Act to relieve her Majesty's subjects from certain penalties and disabilities in regard to religious opinions," by which, among other statutes, so much of an Act of Parliament of Ireland (23 and 24 Geo. III., c. 38) which excepts out of the benefit of that act (namely, the naturalization of all such foreigners as shall settle in that kingdom) persons professing the Jewish religion, is repealed. Thus all the disabilities preventing the naturalization of such Jews as were not natural-born subjects, and hindering them from conscientiously holding any municipal offices, are now removed. But the same

kind of impediment which stood in the way of their holding any municipal offices, still prevents their acceptance of any civil or military offices under the crown, and excludes them from Parliament, and from the possibility of being raised to the peerage. It is necessary before entering into any of these offices, or taking a seat in Parliament, that a person should take one or more of the oaths of allegiance, supremacy, and abjuration, which are made "upon the true faith of a Christian"—oaths, therefore, which no conscientious Jew would on any account take.

We have to inquire, then, on the present occasion, whether the Jews are proper persons to sit in Parliament, so as to justify the alteration of the oath of abjuration, that it shall no longer stand in the way of their admission?

Now although, as we have already seen, the Jews were a distinct people, and were long regarded by the people of these kingdoms as aliens; and although they may perhaps even now be considered a distinct race (European sects being believers in and observers of some particulars in the ordinances of the Talmud, which requires of them the strictest separation from other people)—yet, by long residence among us; from living in subjection to and participating in the benefits of the laws of the land—from having lost their native tongue for colloquial purposes and adopted our own—from having become naturalized, and their descendants consequently natural-born subjects, they have in a great degree lost their distinctive characteristics as a people. They are probably a distinct race, from non-alliance in marriage with our own races, but still their interests are bound up with that of the state; and an English Jew is as much an Englishman, as a French Jew is a Frenchman. And again, an English Jew is as much an Englishman as an English Protestant or Roman Catholic is. The difference between an English Jew and an English Protestant or Roman Catholic is a religious difference; all are Englishmen in thought and in feeling, and equally interested in the well-being of the state. And if the races *are* different, what then? The Jew born within the dominions of the crown, *of parents not at enmity with the sovereign, is by law a natural-born subject, and as such should in natural justice have the same*

rights as other natural-born subjects. If the Jew were necessarily an alien, owing allegiance to another sovereign, he would very properly be excluded from Parliament; and even if he were naturalized, could not take his seat in the legislative halls of the kingdom. But the Jew is not necessarily an alien, or a mere naturalized subject. He may be, and most generally is, a natural-born subject. If a Frenchman were to settle in this kingdom, with his wife, and have a child born to him while resident here, and France was at peace with the sovereign of these realms, the child would be a natural-born subject as much so as any child born of English parents; and though that child were brought up in and professed the Roman Catholic faith, yet he would be entitled to all the privileges of an Englishman. If, when of age, he was ambitious of a seat in Parliament, if he possessed the requisite property qualification, and was duly elected to serve in Parliament, there would be nothing to hinder him from taking his seat. In the name of justice, then, why should not the natural-born Jew—he whose ancestors have for many generations dwelt among us, be excluded? Not, surely, on the ground of his being descended from a distinct people?

Is the Jew a bad citizen? Is he fond of disturbing the peace of the kingdom? Is he rebellious and traitorous? Has he been unfaithful to the trust already reposed in him as sheriff, alderman, justice of the peace, &c.? Is he eminently notorious for dishonesty in his mercantile and business transactions? No! he is a good citizen, a peaceful and loyal subject, a faithful and upright magistrate, an honest and thriving merchant, and an industrious and painstaking man of business. Is he not, therefore, still further entitled to our confidence? We have every reason to believe, that as he has already proved himself to be a good municipal magistrate and administrator of the laws, that he would exercise a just discretion in the capacity of legislator. On what grounds, then, would you exclude him from Parliament, if a laudable ambition should stimulate him to seek the emancipation of himself and his brethren from the incapacities under which they lie, and from the stigma which, while those incapacities exist, will ever attach to his name? Alas! he professes a different faith from your own.

And so, because his conscience will not permit him to think as you do upon spiritual matters, you would suffer him to bear the reproach of unworthiness and untrustiness; you would deny him the full privileges of a British subject, and have him remain under disabilities which render him less free than the child, born upon our shores, of some poor negro slave. "Is it right," it is urged by those opposed to his admission into Parliament, "that a man avowedly averse to the christian religion, should be admitted into an assembly of professing Christians, legislating for a professedly christian community, which in the Upper House contains the heads and rulers of a christian church—is it right to admit such a one into its councils, a man who is bound in conscience to oppose all measures proposed for the welfare of that church, and who would naturally give utterance to views antagonistic to those of the right reverend prelates in the House of Lords, in all matters pertaining to the governance of that christian church of which they are the chief pastors?" This argument sounds plausibly; let us see if it be so in reality.

Although there is an Established Church for England and Ireland, and another for Scotland, yet all religious sects are tolerated in the United Kingdom. Roman Catholics, Dissenters, and Nonconformists of all grades, have free toleration to worship God in the manner and according to the doctrines which they deem most in accordance with scripture. And the Jews form no exception. By the act before referred to (9 and 10 Vic., c. 59, § 2), "her Majesty's subjects professing the Jewish religion in respect of their schools, places of religious worship, education, and charitable purposes, and the property held therewith," are "subject to the same laws as her Majesty's Protestant subjects dissenting from the Church of England are subject to." The Jews, then, who number only about 12,000 in the United Kingdom, have free toleration allowed them. What more in this respect could they desire? Is there any probability of their ever attempting to impose their own religion upon the people? What motive could they have, then, in interfering in church questions? What object would be gained in interfering with the various christian sects? Is it probable they would aid in overthrowing the present established churches, in order to set

up the Roman Catholic or any other christian church in their place? The Roman Catholic is an intolerant church, and they would have far more to fear than hope if that were the dominant church in these realms. It is not probable, then, that the Jews would assist in supplanting the established churches of England and Scotland with the Roman Catholic or any other church. They could have no motive in interfering with church matters, and would therefore refrain from so doing, and accordingly absent themselves from the debates upon such questions. But supposing they were to express their views upon church matters, views repugnant to the well-being of christian churches, would their words carry any weight with them? We cannot expect there would be many Jews in Parliament at any one time; they would ever be reckoned by units in the house, and therefore powerless to effect any great influence in the national councils. Thus our bishops, and the zealots of the various christian sects, have nothing to fear from their religious views. Why, then, in the name of common justice, suffer the Jews to be persecuted for their harmless religious opinions, simply because they differ from your own?

I have endeavoured to prove that the Jew, as a natural-born subject, and as a citizen, is as fit a person as any other natural-born subject of these realms, to hold a seat in Parliament. And I have further endeavoured to show that his religious opinions can in no wise injuriously affect the deliberations of that august assembly. I humbly submit, therefore, that I have shown there can be no reasonable objection to his admission into Parliament.

As to the dislike the nobility may have to number among them Jews, I think the objection scarcely worth a moment's notice. I do not see why a Jew should not as gracefully, and with as much dignity, wear a coronet, and become as faithful and judicious an hereditary adviser of his sovereign, as a Protestant or a Roman Catholic.

One word more. Neither the present form of the oath of abjuration, nor any other form of oath, is sufficient to exclude atheists or infidels, or men void of conscientious feelings, from entering Parliament and attaining to the highest dignities in the state. Why, then, should there be a form of oath to weigh heavily and odiously upon the conscientious Jew?

ADELPHOS.

NEGATIVE ARTICLE.—II.

THE Jew was always beloved of God for the fathers' sake; and the especial and peculiar character of the mission of Jesus Christ proves, beyond the possibility of doubt, that in the purpose of the great scheme of redemption by the man Christ Jesus (who is the link between the Godhead and manhood, being himself both God and man), the Jew stood first and foremost. We find the Saviour affirming that he was sent *only* to the lost sheep of the house of Israel; and with reference to the blessing of the gospel being bestowed on us, we find it stated "to the Jew *first*, and *afterwards* to the Gentiles." Now, it is declared in holy writ that Jesus Christ came to take away the first (the Jewish and shadowy) dispensation, that he might establish the second, viz., the christian and substantial dispensation; but in such change the Jew was not to be lost sight of. Enough has already been said to prove that he was to be the first called to embrace the truth, and be placed in his proper position, not in the Jewish dispensation, then about to be abolished, but in the christian dispensation, then about to be established.

The Jew, unhappily, refused to obey the call, and not only rejected the Son of God, but refused to believe in his mission. This was, we presume, the act to which B. W. P. refers in the January number of this publication, and for which, he says, the people were dispersed, and no longer suffered to exist as such. This judgment of God has not, however, left the Jew altogether without hope; for had B. W. P. gone a little further in his quotation, that "the Gentiles are not to boast against the branches," he would have proved, not only that the branches (the Jews) are actually broken off, but also that there is *one, and only one*, means whereby they can be grafted in again; for the scripture goes on to say, that "they also, *if they abide not in unbelief*, shall be grafted in again."

So long, therefore, as the constitution of England remains christian, and holds for its fundamental doctrine, the fact that Jesus Christ is the Son of God, and God as well *as man, or the christian church* (which not *only* believes this fundamental truth and *national faith* but also acknowledges him as

her eternal and supreme Head) remains a component part of the British constitution, she necessarily places herself under the christian dispensation; and so long as the Jew refuses to embrace the faith of this nation, and tender himself to the bar of the House of Commons as a Christian, ready and willing, not only conscientiously and sincerely to take the necessary oath, but also to legislate for this nation upon the true faith of a Christian, we would humbly submit it is absolutely necessary for those whose office it is to decide such matters, to reject him, not only in order to act consistently with the British constitution, and their own consciences and faith, but also because it may still be open to considerable doubt whether his even election is worth anything in itself, the call of the people being, as laid down by Blackstone, to elect one "*from amongst themselves*," which, in a christian constituency, cannot mean a Jew.

We trust the foregoing remarks will suffice to prove that, upon every rule of principle and constitutional consistency, it must be *morally* wrong to receive the Jew as such into the senate-house of this kingdom, and wrong for him to offer himself as a candidate to a constituency.

It is perfectly true that to attempt to add affliction to another's bonds, or deal harshly towards those who are suffering under the judgment of the Almighty, is far from our duty as Christians. We would not for one moment allow ourselves to act upon such a principle, or thus oppress the Jew. It is, however, on the other hand, desirable that we should consider what we are doing when we endeavour to raise the Jew from his present subordinate position to that of a ruler over ourselves, until at least he has renounced his present creed, and become a subject of the christian dispensation with ourselves, lest we should thereby be made partakers of his sin, and subject ourselves also to the like judgment of God; for B. W. P.'s quotation, with reference to the Gentiles boasting against the branches, goes on to say, "lest thou also be broken off." The laws of Christianity will justify such a view; and the law of this country also recognises the same principle, when it declares that he who harbours a felon, knowing him to have

committed a felony, is himself a partaker of his offence, and punishable criminally as an accessory. The Jew may not know the extent and nature of his sin, but we as Christians cannot plead this ignorance.

Besides, it is submitted that to attempt to raise the Jew into the position of a legislator of a christian nation in his present state of unbelief, would be only to add affliction to his bonds, and injure his own conscience, and possibly thereby increase his punishment, as we should place him in a position where he would be called upon, not only to deny his own faith *in toto*, but to enact christian laws for the regulation of a christian church and community, and also to uphold the faith of this nation, which he not only despises in his heart, but openly and avowedly denies and holds up to ridicule.

The Jew is not to be despised because he is a Jew, nor refused a place in the senate-house of this nation because he lacks capacity, wisdom, rights of manhood, or even morality, much less that affliction may be added to his bonds, but simply because he refuses to be a Christian, to become a member of the christian community, and conform to the rules of the nation. Surely as we are a christian community, and the Jew (who acknowledges himself to be a stranger) desires to participate in our legislation, it cannot be considered hard that he should be called upon to submit to the rules of the society to which he desires to belong; common etiquette demands this, to say nothing of inflexible justice.

We confess we are somewhat surprised that the advocates of the Jews should plead as an argument the fact that there is already corruption in some of our boroughs, and imperfection in some of our representatives. The corruption of boroughs tends greatly to show the evil which may arise from too

great a liberality in these days, for bribery was scarcely heard of till the franchise was extended; and if boroughs are so corrupt, how much greater the necessity for a sound and wholesome check upon them. We are not prepared to admit the application of the expression made use of by B. W. P., with reference to the present members, viz., that the "salt has lost its savour;" and we think it would not go far to substantiate the claim of him who cannot be compared to salt at all. Nor do we think the fact of the present admission of Roman Catholics and others (originally denied a seat), whether proper or not, does in the least justify the admission of the Jew; for however erroneous may be the faith and opinions of these several sects, still they are in some sense acknowledged to be members of the christian community, and claim admission as such; whereas the Jew comes boldly forth with the denial of our faith on his lips, and a positive refusal to submit to the rules of our nation and parliament house.

While we would contend for the purity and exclusive Christianity of the senate-house, we would refrain from offering any opinion upon the strict right of all its present members to their seats, but would only add, should there happen to be any there who ought not to be, we cannot perceive how one error should justify another; nor do we see any *political* reason why the Jew (whatever may be his rights as a man, or even a citizen), *as a Jew*, should take his seat in a *christian* senate-house. We think we have already said sufficient to prove such a course to be *morally* wrong; and we will therefore simply close our remarks with Bentham's most valuable and truthful maxim—"What is *morally* wrong cannot be *politically* right."

VERITAS.

The advantage of living does not consist in length of days, but in the right improvement of them. As many days as are spent without doing some good, are so many days entirely lost.

In narrative, as well as in description, objects ought to be painted so accurately, as to form, in the mind of the reader, distinct and lively images. Every useless circumstance ought to be suppressed, because every such circumstance loads the narration; but if a circumstance be necessary, however slight, it cannot be described too minutely.—Keames.

It were to be wished, *as that which would make learning indeed solid and fruitful, that active men would or could become writers.*—Bacon.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—II.

“Man never is but always to be blest.”

THROUGHOUT the entire course of recorded time this characteristic of human nature obtains a verification. Dissatisfied with his condition, at whatever period in his history we pause, we find man propounding new theories of life—new systems of society; we find him struggling to realize some ideal republic—a “city of the sun,” in the hope that there man with man in “peace and mild equality might dwell;” that there the intellectual aspirations of his being might have a more complete development than was admissible in the then present state. This inextinguishable longing after a happier condition of existence seems to be the impelling element—the incentive to progress implanted by our Maker.

Although these speculative theories have been found inadequate to the end proposed when attempted to be reduced to practice, and although the good which it was fancied would result from them has been vain and illusory, still we would not say that they have been altogether useless to the world. The bare enunciation of the ideas, suggestive as these have at all times been of abuses requiring to be reformed, has checked the growth of that apathy which too many feel regarding all interests of any other than a strictly lucrative nature. These ideas have contributed to enlarge man’s views of social relationship; they have shown him that the well-being of one portion of the community cannot be sacrificed to that of another without endangering by convulsions the system which admits of such injustice.

Communism comes to us recommended by its antiquity. It professes to remove every evil incident to the social state, provided we adopt the principles it submits, which are, equality of goods, equality of labour, and equality of enjoyments. Be it our task to show that the realization of these principles in practice would plunge us into difficulties *tenfold more harassing than the evils complained of in our present state.*

Without a cotemporaneous change in the

natures of men, it is useless to seek to equalize their fortunes. The Communists, without seeking to effect that change, attack private property, as if a new apportionment of that could be efficacious in checking the inherent disposition to acquire.

The fundamental principle of Communism is, that the earth and its produce are the common inheritance of the race, and, as a consequence, that private appropriation is an infringement of the common claim. This principle is endorsed by U. M., and exhibited by him with a deal of plausibility. We concede at once that all men, in virtue of their common nature, have an equal title to the earth, but let it be specially marked that that title is only to the earth in its natural state. There never was a graver misconception than that the earth in its present cultivated condition is common property. No; so soon as man individually expended labour on the soil, so soon did that portion of the soil on which such labour was expended merge from common to private property. Labour constitutes the right to ownership. Labour is the original title to property. This title has hitherto been recognised; but the Communists, fearing that no corner is to be reserved for them, announce the doctrine, that “the earth and its usufruct are common property, and cannot justifiably be subject to private usurpation.” Such fears, to say the least, are premature. The globe is extensive enough to afford room for private appropriation for centuries to come, if not as long as it shall continue to be the theatre of human existence. Land may be obtained in unoccupied territory for the toil of subduing it; but if land be sought in countries already occupied, then it is subject to a burden or rent, which represents the expenditure of labour in its reduction from a state of forestry—in rendering rivers navigable, in forming roads, in constructing railways, and in securing the manifold advantages of a well-regulated state. No one can expect these various advantages secured to him without compensating the doers. It

may be insisted, that although it is perfectly just to exact rent for improvements effected, yet, as there is an intrinsic value in the soil, to hold land in perpetuity is a fraud committed on succeeding generations. We have already shown that there is scope for all, and that, at least, there exists no immediate cause of fear; so long as this is the case, every inducement should be presented for the occupation of the world; the more it is possessed, the greater guarantees have we for its cultivation and productiveness, and the more serviceable is it to man. It is only by securing to individuals unmolested possession, that sufficient inducements are presented.

But Communists see in private wealth the germ of every evil incident to the social state. They do not see that the possessors of wealth are few, and that the constitution of society is such that those stand out prominently; that their station serves as a stimulus to an intenser application to labour on the parts of those who are not wealthy; that, but for that wealth which they so much deery, those extraordinary manifestations of mechanical skill which have so astonishingly augmented production, would have had no existence save in the minds of the ingenious projectors. Communists mistake regarding the transmission of wealth, and on this point C. M. lays particular stress. They imagine that wealth is a perpetual inheritance; now no position can be more erroneous: every day's experience tells us that fortunes are in a continual flux, and it can be shown that, on an average, land even changes from family to family every three or four generations. Ten years hence—ay, less—the nobleman may be little better than a pauper, and ten years hence the plodding youth may be a respected esquire. Ours is a state in which labour having its appropriate reward, all the energies of mind are developed to their utmost limits. It is by the uncontrolled exertion of man's faculties that property has attained its growth. Opulence serves a wise end in the general economy; it admits of leisure for study, and attracts to itself hosts of literary aspirants, whom it generously fosters. But we have already said, to the effect, that as all inheritors are not alike prudent, it is impossible that wealth can continue in the same families for a long series of generations. *Wealth is diffusive.*

But prior to the cultivation of the soil,

riches had no existence; riches are merely accumulated labour. To seek to deprive me of the results of my own or of my ancestor's labour, is a species of justice which, as yet, has happily had no honourable precedent. It must be from an inadequate perception of the functions which wealth performs in society, that the Communists' objections originate. The wealthy are a necessary existence in the body politic.

Supposing Communism was a practicable scheme, we should hope for its realization, not from the influence of any institutions, but from an increasing intellectuality. The fact is, reason as we may, from infancy to age, man clearly manifests his attachment to private property.

We must, whatever social form we adopt, accept human nature as it is. The Communists, however, seek to remove the fear of want, forgetting that that is one of the strongest motives to our activity. The fear of want is the chief source of the civilization to which we have attained. If that motive to action be withdrawn, what shall secure us against a relapse into barbarism? The wind that tosses the ocean is that to which we are indebted for its salubrity.

The upholders of Communism take a too favourable view of human nature. They imagine man a being inspired by the most exalted sentiments, the most sublimated disinterestedness, the most heroic abandonment of self. Such godlike qualities do gleam out at rare intervals, but their duration is transient. One can scarcely bring himself to the belief that man, as pictured under the Communists' regime, is the same being which we find in our state cavilling about every little discrepancy between his own and his fellow-labourer's remuneration. We do not say this deprecatingly, but we repudiate the ideal which Communists create. We believe, that were Communism attacked on this one point, the remuneration of labour, its unworkableness could easily be made apparent. While we are on this subject we shall submit one or two remarks for the consideration of those who support the affirmative.

In order to secure the honest co-operation of each member of the community, it will be necessary that the common workshop be adopted; this is the only security against idleness, for to each the idea that he shall enjoy or want just as the common stock is

in a prosperous or in a depressed condition, is too remote to awaken active interest. Each member would loiter, in the belief that his neighbour was performing his full complement. Without the common workshop Communism could not exist. But a difficulty arises. One man can, in the same space of time, do a third more work than another; will the knowledge that he is a participator in the common benefit resulting from that increased amount of labour satisfy him? Assuredly not, if his nature retain the characteristics which it has at present. The swifter worker should either labour a shorter period, or should obtain an increase of remuneration; but if he labour a shorter period, that will beget disquiets, and if he obtain an increase of remuneration, private property will reappear.

Communism is open to another objection: the equality it presupposes is inimical to the generous culture of the mind, inasmuch as it offers no special encouragement to skill. The illiterate clown and the cunning

artificer share the like fortune; this equality is refuted by nature, for the baser own a servitude to the nobler minds.

Communists err in making their calculations respecting men only as masses, only as so many units who shall fall into the different positions assigned them, without any more ado. Nothing can be less philosophical; there is an individuality in every man, and some men stand out in bold relief from all other men. Those require a separate legislation. Napoleon-like, they would convert the community into an army.

Communism is a system from which our sympathies revolt. The insipidity of its routine—the total want of stimulus to energetic action—the non-existence of that intercourse which in our social state contributes so materially to educate the man;—these, over and above those we have adduced, form valid objections to the system. We have no faith in its practicability, and of course no faith in its capability of promoting the happiness of man.

J. N.

AFFIRMATIVE ARTICLE.—II.

SIR,—I observe an able article on the negative side of this question, in the late number of your valuable periodical, from the pen of C. W. Jun., on which I design to found a few remarks. The first of the conclusions to which this writer appears to have come is, "That Communism in theory has never shown itself adequate to meet the wants, and promote the happiness, of man."

Is this conclusion a correct one? If so, how comes it about that the idea, even according to his own account, has been ever and anon making its appearance from a very early period? How was it that so large a portion of the Communistic element was introduced by God himself into the laws and constitution of the Israelitish nation? for it must be acknowledged that their land was not private property in the same sense in which land is at present held; so far from this, it was inalienable from the family to which it was at first allotted, so long as that family existed. Nor was money held altogether as private property; for usury, in all its forms, is most emphatically condemned, while the man who retained as a pledge the poor man's garment was cursed. That the institutions of the Mosaic economy

were not altogether Communistic we grant; the reason they were not is probably to be found in the people themselves. How entirely so is the spirit of their scriptures is evident from the summary of the Lord himself—"Whatsoever ye would that men should do to you, do ye even so to them; for this is the law and the prophets."

Further, if the theory of Communism be so defective, how was it that the apostles were Communists, and exemplified their sentiments by forming the first christian church into a community? and when this community was in straits, from various causes, how was it that they urged upon other churches the importance of assisting them, not as an act of charity, but as an act of duty? And how is it that, even now, surrounded as we are by individual cares, that when we are enabled for a few moments to forget things as they are, and think upon them as they ought to be—and would be, were all men influenced by Christianity as Christianity is intended to influence men—we dwell for ever upon a happy Communistic state? Surely it is that the principle contains within it something vital, even though men may at present be in an unfit state for its general adoption.

The second conclusion to which C. W. has arrived is, that Communism has proved a failure in practice.

Suppose that all that our friend has advanced on this point be admitted, it certainly would not prove that the principle of Communism is incapable of practical application, or that, if fairly and practically applied, it is incapable of benefiting the race. It may only prove that the persons who have attempted to carry out the principle have not been adapted to the work, or it may prove that the world has not been sufficiently advanced to carry out the principle. Many schemes have become possible of late years which, ages ago, would have been impossible; and many things, we have reason to believe, will be possible in ages to come, which, in the present age, are not so. According to our friend's own account, these two latter would appear the more probable reasons for failure.

If a principle of so sacred a nature is to be carried out successfully, it must be carried out by persons who have faith in it. Now it is not certain that all the leading parties who have hitherto superintended experiments of a Communistic character have believed in the principle. The probability is, that it has been adopted in more cases than one from mere selfish motives, to answer selfish or party purposes. Who, for instance, would answer for the fairness of the late experiments in France?

But the principle has at least *partially* succeeded in the case of the Moravians, even according to our friend's account—"These seem to have been the most successful of all sects of Communistic adventurers." If, then, these sects, the Moravians and others, have been in some measure successful, it is but natural to ask, has their success in any measure tended to promote the happiness of man? If it has, then the principle of Communism, if generally adopted in a similar form, would be likely to promote a similar result; if not, it may be well to ask whether this arrangement has done anything to promote their own happiness as a body? Perhaps the best method of answering this question will be by asking and answering another, viz.—Has the fact of the Moravians living in a Communistic state done anything to promote their usefulness in the world? If it has, then it has promoted

their own happiness; for Christians are, for the more part, happy in proportion as they are useful. "It has been remarked," says the Rev. T. Smith, "as a fact worthy of observation, that when the United Brethren first undertook to send out the word of salvation to the benighted and perishing heathen, their own congregation did not exceed 600 persons; and of these the greater part were exiles from their native land, who after and during the most cruel persecutions on account of their religion, found a tranquil and hospitable asylum on the estate of Count Zinzendorf." "So ardent was the zeal, however, which glowed in their bosoms, and so abundantly were their unostentatious attempts owned and blessed by the Great Head of the church, that, within the short period of ten years, their heralds of salvation erected the banner of the cross in various distant parts of the earth, and, through their instrumentality, it may be confidently hoped that many who were formerly sitting in darkness and in the shadow of death are now standing before the throne of the Most High."

Now the question arises, Would these people have been of as much use if the Communistic element had not been introduced among them. This question would perhaps be best answered by comparing the numbers of this body with the numbers of other bodies, and the benefits which have accrued from their missionary efforts, with those which have resulted from the efforts of anti-Communistic bodies; our space, however, would not admit of any very extended comparison. We shall therefore content ourselves by giving the result of such a comparison as given in Buck's "Theological Dictionary," by Dr. Henderson:—"But the Moravians have exceeded all in their missionary exertions. They have various missions; and by their persevering zeal it is said that upwards of 23,000 of the most destitute of mankind, in different regions of the earth, have been brought to the knowledge of the truth. Vast numbers in the Danish islands of St. Thomas, St. Jau, and St. Croix, and the English islands of Jamaica, Antigua, Nevis, Barbadoes, St. Kitts, and Tobago, have, by their ministry, been called to worship God in spirit and in truth. In the inhospitable climates of Greenland and Labrador they have met with abundant success, after under-

going the most astonishing dangers and difficulties. The Arrowack Indians, and the negroes of Surinam and Berbice, have been collected into bodies of faithful people by them. Canada and the United States of North America have, by their instrumentality, afforded happy evidences of the power of the gospel. Even those esteemed the last of human beings, for brutishness and ignorance, the Hottentots, have been formed into their societies, and upwards of 700 are said to be worshipping God at Bavians Cloof, near the Cape of Good Hope." Such is a specimen of the labours which have been accomplished by a comparatively insignifi-

cant body of Christians, labours which, but for their adoption of the Communistic element, would have been impossible. If a few hundreds of persons have, by the adoption of this principle, been able to accomplish so much, what might not have been the state of the world at the present moment if the entire christian church, during the last 1,800 years, had pursued a similar course? From such facts as these we conclude that Communism, if properly carried out by persons who are imbued with its spirit, is well calculated to render important service to the family of man.

The Societies' Section.

EUROPEAN PHILOSOPHY.

BY THE AUTHOR OF "THE ART OF REASONING."

PROLOGOMENA.

THE mind of man cannot long remain unagitated by the troublings of great thoughts—cannot long remain unstirred by the promptings of a pangless, solemn curiosity—cannot long refrain from inquiring, What am I?—Whence came I?—Wherefore am I here?—Whither am I bound?—and do no rocks bestud this life-sea on which I am embarked? There seems to be a necessity inlying in the soul to cast its eye forth towards the infinite and the absolute, that it may snatch a glimpse of that Omniscient One who sits enthroned amid creation's amplitudes—to wonder at the busy play of thought, emotion, and reason with which its consciousness is being continually impressed—to watch the process of thought-evolution in order to learn the genesis thereof—and to engage in the attempt to solve the problems of the reason regarding the mystery of being. Is there a criterion of truth—a test of evidence—an absolute touchstone by which verity may be discovered? is a question which must frequently disturb the mind. Man cannot restrain the speculations of the reason regarding his essence and his destiny, when it attempts to ascertain whether he is a merely passive recipient of concatenated and sequential impressions—a mere educt of some stupendous system of causation-linked phenomena—a partner in the irreversible fate of the atoms and automata with which the dreary uniform and monotonous whirl of law-governed antecedence and sequency has surrounded him—or a self-motived being—an independent and differentiated existence, subordinated only to the over-mastering authority of a Creator-God, continent of an investigative power *capable of making a calculus of the laws of matter and of being, and of consorting these to the production and attainment of his own ends and aims*—"the interpreter of nature," *fall of intuitions, faiths, volitions, and desires.* Who has not felt such thoughts?

"They seize upon the mind, arrest, and search,
 And shake it—bow the tall soul as by winds;
 Rush over it like rivers over reeds
 Which quiver in the current—turn us cold,
 And pale, and voiceless—leaving in the brain
 A rocking and a ringing—glorious,
 But momentary."

If any, in him have been planted the first germ-seeds of philosophic thought. Such ideas it is the business of the Mind-analyst to steady before conception's eye, and by a severe bracing and persevering ratiocinative struggle, to attempt to become the discernor and demonstrator of their real significance. This is the mission of Philosophy.

Whence come such thoughts, and wherefore? Are they the primal throbbings of the consciousness awakening into energy and vital power, and eagerly inquiring for a chart which may become the soul's guide on its life-journey? We think so. We think that in such thoughts Nature speaks — speaks to call man's higher, nobler being into ardent and active vitality. They are the soul's protest against the "dull, flat, stale, and unprofitable" utilitarianism and inglorious self-case to which mere physical studies incline the mind. They are silent, yet eloquent, monitors regarding the duty, necessity, and advantages of acquiring self-knowledge.

Let us not be misunderstood. There are no sincerer admirers of human skill—no more hopeful spectators of human progression—no more devoted co-workers for man's advancement than ourselves. We look with pride upon that positive science, the gradual growth of centuries, by which those worlds which, to the sensuous eye

"Seem but as specks of tinsel fixed in heaven
 To light the midnight,"

are weighed and measured, have their orbits gauged, and their progresses and perturbations subjected to mathematical skill—by which pages of God-written history have been dug from the depths of our planet—by which creation's elemental atoms have been analyzed and rendered subservient to human use—by which the laws of "life, health, and disease" have been discovered—by which the lightnings are already, and the winds seem about to become, the winged messengers of human purposes and thoughts. We think with ecstasy upon that Titanic effort of human genius, the application of steam to practical purposes. We admire the perfection of the fictile, the textile, and the plastic arts. "The products of the arts and industry of all nations" have excited in us astonishment, surprise, and awe. Our commercial, trading, civil, and governmental relations, so accurately adapted, so sedulously cultivated, so almost perfectioned, have made us marvel at the extent of human ingenuity. All these have made us sensible of the vastness of human knowledge. But they have done more. They have rendered us cognizant of the fact of man's comparative ignorance. Of the universe much is known—of its Creator how little! Of the method of producing effects man's knowledge is vast—of the *Self* by which effects are produced, what know we? In the amassing of facts, the colligation of ideas, the upbuilding of theories, the ransacking of nature, arranging, categorizing, utilizing, we are wise. But is there *no higher wisdom, no more glorious progression, than this? Is the ultimate destination of man concerned only with buying and selling—the state of*

things on 'Change—the prices current of cottons, silks, corn, leathers, furs, &c.—the preparation of dye-stuffs—the printing of calicoes—the production of apparel—the tillage of the earth—the manufacturing of steam-ships, steam-looms, and other artfully-constructed enginry and mechanisms? Or is there a progression more consonant to, and more intimately connected with, the nature, duty, destiny, and character of the thought-agency by which these are produced? To such questioning does not every human soul exclaim with mighty-minded Fichte?—

“Not for its own sake, but for the sake of that *for which it prepares us*, can I support this world, esteem it, and perform my part in it with joy. My mind can take no hold on it, but my whole nature rushes onwards with irresistible force towards *a future and a better state of being*. Shall I eat and drink only that I may hunger and thirst; and eat and drink again, till the grave, which yawns beneath me, shall swallow me up? Shall I beget other beings in my own likeness, that they too may eat, drink, and die, and leave others behind them to follow their example? To what purpose this perpetually revolving circle, this everlasting repetition, in which things are produced only to perish, and perish only to be again produced?—this monster continually swallowing itself up, that it may again bring itself forth, and bringing itself forth only that it may again swallow itself up? Never! Never can this be *my* destiny, or that of the world! Something that is to endure must be brought forth in all these changes of the transitory and the perishable—something which may be carried forward safe and inviolate upon the waves of time.”

It was a sublime saying of Kant's, “That there are two infinities displayed to every human being—the infinity of the universe, in which he is a dweller, and the infinity (speaking it not impiously) which is contained within us.” But the infinitude of the outward universe—the gorgeous pavilion of the sky—the world-gems deep in midnight's azure set—the presidential day-orb—the heaven-piercing hill—the steep-falling cataract—the broad prairie—the circumvolving ocean, shall fade from the eye which beholds it. The mind, however, that other and more glorious infinity, created in the image of the All-wise, shall endure, when the sun, amid cloudy masses of intensest splendour, shall abdicate his presidency—when

“Dimly uplifting her belated beam
The blank unwelcome round of the red moon”

has shown itself, then vanished in the smoke of earth's entire destruction; for

“Death's at work,
And one by one shall all yon wandering worlds,—
Whether in orbit path they roll, or trail
In an inestimable length of light
Their golden train of tresses after them—
Cease;

* * * * *
* * And thou and I shall live as now.”

If, then, the study of the beautiful delight—if inquiries regarding the sublime captivate—if physical discoveries excite admiration, and win an easy power over the soul—if the wonders of nature and of art, which are but the educators of the mind, interest and excite

—how much more ought we to feel enthusiasm in the study of that immortal power which dwells within, and is ourselves?

Were studies chosen on account of their intrinsic (not their apparent) value and utility, which could for a moment compare with Speculative Philosophy! One of man's earliest and most important duties, for instance, is self-examination; but how can this be effectually entered upon and accomplished without the keenness of intellect and accuracy of thinking—the clear-thoughted, skilful discriminativeness, and the capacity for thought-anatomization which results from a study of “the Science of Mind?” By this study we learn the various powers of the mentality, their relative duties and importance, our own deficiencies of intellectual power or culture, the most effectual remedies for such deficiencies; and in the very act of studying the mind, we elevate, refine, and improve our nature. But, it may be objected, that men have thought worthily, acted nobly, and improved themselves marvellously, to whom the very name of speculative science was unknown, and into whose hands no treatise on the human mind had ever found its way. True and undeniable, indeed! But even so men lived, moved, their blood circulated, and their bodies performed all the functions of life before Hippocrates, Galen, Harvey, &c., and their disciples, had ascertained the laws of life, the modifications and diversities of disease, and the few remedial agencies which they employ; and if it is of high moment that men should study the laws and conditions of bodily health, and should conform to their injunctions, is it not of far greater importance that they should learn the laws and conditions of mental health, in order that hereafter they may be enabled to labour intelligently in the accomplishment of those noble duties of humanity—self-elevation, self-control, and self-reform?

Turn we now to another phase of this “many-sided” topic, namely, its influence on, and connexion with, Education. In this point of view Philosophy has been denominated by Rome's greatest orator, Cicero, “the parent of life—the medicine of the mind—the mother of good deeds and sayings.” If it be of great importance that man should be educated—that his moral and mental nature be educed—then the study of Philosophy partakes of that importance; for, unless we know what is within—unless we understand the powers which are enclosed—how can we lead them out? If it be necessary that the agriculturist should know the properties of the seed on which his culture is to be expended before he applies that culture, it is surely much more necessary that the educator should possess a knowledge of the faculties of the soul. How true are the words of Dr. Thomas Brown! “The true science of education—that noble science which has the charge of training the ignorance and imbecility of infancy into all the virtue, and power, and wisdom of mature manhood—of forming of a creature the frailest and feeblest, perhaps, which heaven has made, the intelligent and fearless sovereign of the whole animated creation, the interpreter, the adorer, and almost representative of the Divinity—is the Philosophy of the human mind applied practically to the human mind; enriching it, indeed, with all that is useful or ornamental in knowledge, but at the same time giving its chief regard to objects of yet greater moment; averting evil, which all the sciences could not compensate, or producing good, compared with which all sciences are as nothing.”

But this knowledge of Philosophy is necessary to all, inasmuch as we are all educators.

Friendship, affection, paternity, filiality, association, are all processes of education, which, to conduct aright, require an acquaintance with the human soul, its faculties, its aspirations, and its tendencies. Each man is the educator of his brother man. Mighty truth, how easily spoken, how difficult of full realization! Oh, that we could rightly estimate our responsibility, and accurately calculate the influence for good or evil which we scatter through the world! Music, Poetry, Painting, Sculpture, History, Conversation, Business, Debate, &c., can only exercise themselves well as educational agents when directed by a mind carefully and elaborately acquainted with the results of speculative science. From this remark it will be perceived, that we do not think that education fulfils its duties correctly or adequately when it stores the passive mind with the chief facts of those branches of knowledge most in request, but when it excites the germinating powers of the soul to the productions of new thoughts, new conceptions, new imaginations and ideas. With all due deference, then, to the positivism and utilizing spirit of "the present age"—despite of the prevalent disposition of men in our own day to reiterate the questions, "*cui bono?*" and "how much *per cent.*?"—we would most respectfully depone, that, merely in consequence of our inertitude and carelessness regarding the problems of Psychology, mighty truths which might set the world astir, and move the deep stagnation of men's souls, are slumbering in the oblivion caused by our deficiency of skill so to develop and educe the mental faculties as to enable men to bring forth their latent-lying thoughts in such a manner as must impress and penetrate the world. We do not believe that all investigations except such as regard mere sensuous appearances are impracticable and absurd. We do not believe that no solution can be found for the problems of the Reason. We do not admire the protracted apathy of this gold-adoring time to the momentous queries which the soul is necessitated to propound. We do not look with complacency on the practical contempt which men entertain concerning the irrepressible instincts of their nature—that forth-goingness of soul which implicitly asserts the unsatisfactory nature of the present, and is the *substratum* of the thoughts and speculations in which metaphysicians are engaged. Well, but—it is argued against us—if it be true, as you assert that the soul of man is naturally and irrepressibly urged on to desire a reconciliation between the perplexing anomalies amid which it finds itself placed, how account ye for the fact which you yourself admit and lament, viz., that there is a manifest disinclination in the public mind to occupy itself with Philosophical speculations? One answer to this is obvious. Man is a dual being; there is within him a contention of natures—strife between mind and matter—a conflict between the outer and the inner world—an man has become embondaged in the present, the practical, the utile, the positive, the sensuous. Reason and Faith—the intuitional and the external—man's state and his desires—human nature and the material world, are at variance, and man has acquiesced in the materialistic, and oppugned the spiritual, instead of striving after their consensuous union and agreement. The slave cannot remain ungalled, so neither can the mind long refrain from exerting that aggressive and progressive energy which inclines it to ponder on the mystery of cognition, to reflect upon the nature, powers, and designs of Him who setteth the mechanisms and spiritualities of creation in motion, and muse upon the after-destiny which awaits it. Positivism, it is true, replies that all things are passive and enduring—that nowhere is there anything possessed of a self

motive force, but everywhere an inherited and inviolable mobility—that antecedence and sequency are bound together by an invincible and irrefragable law—that change succeeds change in unalterable consecution—that force after force whirls its gigantic waves athwart the universe irrevocably and indissolubly interlinked. Positivism becomes thus the negation of Philosophy, and denies the possibility of our ever attaining any higher knowledge than that which relates to Law. Thus whispers she to the human soul—The ponderous orbs which circle amid the dark-blue sublimities of heaven—the comets which traverse the immense vastitudes of the universe—the storm-maned ocean—

“Dark-heaving, boundless, endless, and sublime,”

which appears to us as if, in very wantonness of spirit, it tumbled tumultuous in its fierceness—the wind, the poet's image of inconstancy, which to human eye “bloweth whithersoever it listeth,” move not but under the governance of Law, and why shouldst thou,

“Poor thing of doubt and clay, whose faith is built on reeds,”

imagine that thou art free to will—that thou art not also one of the legion of dependent and passive beings—a slave of “circumstances that unspiritual God”—a link in the uninterrupted chain of sequentiality—an *item* in the muster-roll of effects? Wherefore thinkest thou that on the circumference of the giddy wheel of Fate thou art not also swept onward to thy destiny? Why dost thou suppose that will, purpose, or action, are more controllable by thee than the orbital on sweep of the comet—the measured march of the midnight constellations—the ragings of the upsurging ocean—the outbursting of a volcano fire, or the howlings of the tempestuous wind? Let me assure you, that as the forest-leaf is borne resistlessly away on the wings of the Arabic simoom, so also art thou driven along in the unpausing circuit of phenomena-governing Law. Philosophy attempts to lead us out of this “house of bondage”—to free us from the prison-withes of passion and of circumstance “wherewith we are darkly bound”—to burst the fetters of the fatalistic Logic with which physical science is apt to enthrall us. It offers to lead us out of the region of sophistication, uncertainty, and apparency, into the territory of the true, the certain, and the absolute. It denies that the laws of man's being are given only in his organization—that he is a powerless agent in the flux and reflux of circumstances—that his present nature is the measure of his powers—that his inclinations are the visible handwriting of the invisible yet resistless power of Law—that it is vain to resist our impulses, and sinless to pursue the ordinances of Destiny. It professes to be able to satisfy the yearnings of the soul—to be capable of unfolding to the mind of man those high thoughts and principles which ought to regulate the conduct, govern the reason, overrule the passions, elevate the nature of man, and teach him to—

“Adore with steadfast, unassuming gaze
Thou Nature's essence, mind, and energy,
And gazing, trembling, patiently ascend,
Treading beneath their feet all visible things
As steps that upward to their Father's throne
Lead gradual.”

Coleridge's “*Religious Musings*.”

It professes to have the power of informing man regarding Destiny, Nature, the Soul, God, and all that interesting series of truths which are involved in these mystery-enshrouded

In our next we shall inquire what is the *genesis*, or birth-source, of philosophic thought—what is the nature of the queries originated in the philosophic intellect. These things we think it necessary to consider briefly previous to our proceeding to unfold to our readers the several solutions which have been given to “The Problems of the Reason.” Such a consecutive and concatenated view of “European Philosophy” as we then purpose to present, cannot fail of being useful, gratifying, and mind-improving; for there is much truth in the words of Buffon, “How much useful knowledge is lost by the scattered forms in which it is ushered into the world! How many solitary students spend half their lives in making discoveries which have been perfected a century before their time, for want of a condensed exhibition of what is known.”

THE IMPORTANCE OF APPLICATION TO STUDY.

It is by dint of steady labour—it is by giving enough of application to the work, and having enough time for the doing of it—it is by regular painstaking, and the plying of constant assiduities—it is by these, and not by any process of legerdemain, that we secure the strength and the staple of real excellence. It was thus that Demosthenes, clause after clause, and sentence after sentence, elaborated, and that to the uttermost, his immortal orations;—it was thus that Newton pioneered his way, by the steps of an ascending geometry, to the mechanism of the heavens—after which he left this testimony behind him, that he was conscious of nothing else but a patient thinking, which could at all distinguish him from other men. He felt that it was no inaccessible superiority on which he stood, and it was thus that he generously proclaimed it. It is certainly another imagination that prevails in regard to those who have left the stupendous monuments of intellect behind them—not that they were differently exercised from the rest of the species, but that they must have been differently gifted. It is their talent, and almost never their industry, by which they have been thought to signalize themselves; and seldom is it averted to, how much it is to the strenuous application of those commonplace faculties which are diffused among us all, that they are indebted to the glories that now encircle their remembrance and their name. It is felt to be a vulgarizing of genius that it should be lighted up by any other way than by a direct inspiration from heaven; and hence men have overlooked the steadfastness of purpose, the devotion to some single but great object, the unweariedness of labour that is given, not in convulsive and preternatural throes, but by little and little as the strength of the mind may bear it, the accumulation of many small efforts, instead of a few grand and gigantic, but perhaps irregular, movements, on the part of energies that are marvellous—men have overlooked these as being indeed the elements to which genius owes the best and the proudest of her achievements. They cannot think that aught so utterly prosaic as patience, and painstaking and resolute industry, have any share in the upholding of a distinction so illustrious. These are held to be ignoble attributes never to be found among the demi-gods, but only among the drudges of literature; and it is certainly true that in scholarship there are higher and lower walks, but still the very highest of all is a walk of labour. *It is not by any fantastic jugglery, incomprehensible to ordinary minds, and beyond their reach—it is not by this that the heights of philosophy are scaled.* So said he who towers

so far above all his fellows; and whether viewed as an exhibition of his own modesty, or as an encouragement to others, this testimony may be regarded as one of the most precious legacies that he has bequeathed to the world.

Let me endeavour to guard you against this most common error of the youthful imagination, and into which you are most naturally seduced by the very splendour and magnitude of the work that you contemplate. The "Principia" of Newton, and the "Pyramids of Egypt," are both of them most sublime works; and looking to either as a magnificent whole, you have a like magnificent idea of the noble conception or the one mighty power that originated each of them. You reflect not on the gradual and continuous, and I had almost said creeping, way in which they at length emerged to their present greatness, so as now to stand forth, one of the stateliest monuments of intellectual, and the other of physical, strength that the world ever saw. You can see, palpably enough, how it was by repeated strokes of the chisel, and by a series of muscular efforts, each of which exceeded not the force of a single arm, that the architecture was lifted to the state in which, after the lapse of forty centuries, it still remains one of the wonders of the world; but you see not the secret steps of that process by which the mind of our invincible philosopher was carried upward from one landing-place to another, till it reached the pinnacle of that still more wondrous fabric which he himself has consummated. You look to it as you would to a prodigy sprung forth at the bidding of a magician, or at least of one whose powers were as hopelessly above your own, as if all the spells and mysteries of magic were familiar to him. And hence it is that nought could be more kind, and surely nought more emphatically instructive, than when he told his brethren of the species wherein it was that his strength lay—that he differed not in power, but only differed in patience, from themselves; and that he had won that eminence from which he looked down on the crowd beneath him, not by dint of a heaven-born inspiration that descended only on a few, but by dint of a home-bred virtue that was within reach of all.

There is much of weighty and most applicable wisdom in the reply given by Dr. Johnson to a question put to him by his biographer relative to the business of composition. He asked whether, ere one begin, he should wait for the favourable moment, for the afflatus which is deemed by many to constitute the whole peculiarity of genius? "No, sir; he should sit down doggedly," was the deliverance of the great moralist. And be assured, gentlemen, that there is much of substantial truth in it. Whether it be composition, or any other exercise of scholarship, I would have you all to sit down doggedly; for if you once bethink yourselves of waiting for the afflatus, the risk is that the afflatus may never come. Had your weekly or your monthly essay not been forthcoming, I should scarcely have deemed it a satisfactory excuse that you were waiting for the afflatus. With this doctrine of an afflatus I can figure nothing more delightful than the life of a genius, spent as it would be between the dreams of self-complacency and those of downright indolence. For I presume, that during the intervals between one attack and another of this mysterious affection, he may be very much at ease, living just as he lists; and for all his rambles and recreations abroad having this ready explanation to offer, that he had no visit this day from his muse to detain him at home. Existence at this rate were one continued holiday; be very sure, gentlemen, that it is *not the existence* by which you will ever be guided to *ought that is substantial in the acquirement of philosophy*. It would be a life of illusion—

an airy and fantastic day, that should terminate in nothing. And we again repeat, that if at all ambitious of a name in scholarship, or what is better far, if ambitious of that wisdom that can devise aright for the service of humanity, it is not by the wildly, even though it should be the grandly, irregular march of a wayward and meteoric spirit that you will ever arrive at it. It is by a slow, but surer path—by a fixed devotedness of aim, and the steadfast prosecution of it—by breaking your day into its hours and its seasons, and then by a resolute adherence to them; it is not by the random sallies of him who lives without a purpose and without a plan—it is by the unwearied regularities of him who plies the exercise of a self-appointed round, and most strenuously perseveres in them. It is by these that mental power, I will not say is created, but it is by these that mental power is both fostered into strength, and made tenfold more effective than before; and precise, and methodical, and dull as these habits may be deemed, it is to them that the world is indebted for its best philosophy and its best poetry.—*From an Address by Dr. Chalmers to the Students of St. Andrew's ; Memoirs, vol. iii.*

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Milngavie Mechanics' Institution.—The present session of the above institution was opened on Monday evening, December 1st, with an introductory lecture by Professor Eadie, D.D., LL.D., Glasgow. Mr. H. Ross, president of the institution, occupied the chair, and in a brief address introduced the learned professor, who delivered a most eloquent and high toned oration on "Man's connexion with the circle of the sciences." The lecture was listened to throughout with marked attention by a crowded audience.

It was truly cheering to recognise and experience in so eminent a divine a warm friend of mechanics' institutions; and from his masculine recommendation of their design and tendency, we have experienced an infusion of new life into our institution, which is happily in a flourishing condition. The committee have secured the aid of many talented and respectable gentlemen to lecture during the winter, and there can be no doubt but that these lectures will, in every way, prove very beneficial and instructive to all who avail themselves of the advantages of the institution. The library belonging to the institution contains about 760 volumes, among which are to be found many of the recent, popular, and standard works of our most celebrated authors in every department of literature and science. The terms of membership are such, that it places within the reach of the humblest artizan an inexhaustible supply of those mental enjoyments and benefits, without which life is but the shadow of existence.—H. C., Sec.

Bankfort.—Hebden Bridge Mutual Improvement Society.—The members of this society held their fourth anniversary meeting in the Wesleyan schoolroom, on Christmas-day. Mr. Thomas Smith occupied the chair. The secretary read the report, which stated that lectures had been delivered during the past year on History, Chemistry, Natural Philosophy, Phonography, Botany, &c., and discussions held on several important subjects. The meeting was afterwards

addressed by several of the members and friends of the society.

The following resolution was adopted at a committee meeting held the previous night:—"That the two volumes of the *British Controversialist* be purchased forthwith, and that next year it be taken in monthly."

Leith Young Men's Society.—The seventh annual soiree of this society was held in Mr. Kay's class-rooms, on the evening of Friday, 26th ult. Mr. George T. M. Inglis, president, occupied the chair, and after tea made a few excellent remarks on "The literature of the present day." Mr. Richard Fotheringham, secretary, then read the annual report, which showed that in the course of the year 121 young men had been in connexion with the society; 30 of these, however, having resigned in consequence of removal, &c., left as the present numbers on the roll, 91 members; or an increase of 24 over last year's report. The following addresses were afterwards delivered in the course of the evening:—Mr. Jas. Brown, on "Freedom;" Mr. George Smith, on "The Head and the Heart;" Mr. Neil Jamieson, on "Motives to action, drawn from the character of St. Paul;" Mr. David Small, on "Ambition's noblest aim." The speakers did ample justice to their subjects, and the company separated at a late hour, all highly delighted.

Kelvedon Mutual Instruction Society.—In the rural, although somewhat superior, village of Kelvedon, situate not far from the centre of Essex, there exists a band of young men, who, although "far remote" from the excitement of more mercantile and wealth-getting districts, have yet devoted their energies to the cause of the onward progressiveness of human nature, and are beginning to make themselves felt as well as known. The outward manifestation of their operations is a mutual instruction society, where all the usual advantages which belong to such societies are made easily accessible. This society

has been in existence for several years, and perhaps one of its most interesting features is the meeting which annually takes place, not only of those who act in the management of the society, but also of those who take in its advantages, but also of those who see and hear and know what it is doing, or have been done—spectators from without, who come to testify their approval of the objects sought, and the modes adopted for their attainment. One of these gatherings took place on the evening of the 14th. The proceedings commenced by about seventy persons sitting down to tea. This over, the more immediate business of the evening was proceeded with. Mr. C. Walford, jun., of Witham, was invited to preside, and on taking the chair addressed the meeting, remarking more especially on the progressiveness of the age—the increased, and constantly increasing, facilities for the acquisition of knowledge. Schools and institutions were now everywhere to be found. Literature was extending itself at a rate hitherto unprecedented, addressing itself alike to the cottage and the palace. Science was equally progressive and unbounded. No previous age had possessed such advantages. The grand point therefore to be remembered was, that with these increased advantages came an increased responsibility for their proper use in furthering the progress of humanity. Mr. Wm. Braddy, the secretary, read a satisfactory report of the society's proceedings during the past year. Mr. Godfrey and Mr. Crane severally moved and seconded the adoption of the report. Messrs. J. Moss, J. Beaumont, and W. Braddy, delivered eloquent addresses. The following gentlemen also addressed themselves to a series of animated resolutions, prepared by the committee:—Messrs. Hicks, Walford, sen., Willshire, W. Braddy, and Matthews. The whole of the speakers appeared animated by one common object, that of promoting the objects of the society, and extending its advantages. Some excellent recitations were given by several of the gentlemen present. Another pleasing feature was the number of ladies present, who seemed fully to join in the spirit of the meeting. We wish the society many of such happy gatherings.

Glasgow Young Men's Literary Improvement Society.—Mr. Editor,—Circumstances of a strictly private nature having brought us to Glasgow, and this fact having become known to the members of the GLASGOW YOUNG MEN'S LITERARY IMPROVEMENT SOCIETY, we received the honour of a kindly invitation to a soiree held in Lennox's Temperance Coffee-house, in that city, by the members of that society, on the evening of the 14th November, 1851. Mr. Donald Mills occupied the chair, and in an excellent speech took a rapid glance at "things as they were, are, and ought to be." The company then proceeded to take tea, and a few other substantialities which accompanied it. The chairman again addressed the meeting on "the advantages of knowledge." Mr. A. Forsan spoke upon the "Tendency of Mutual Improvement Societies." Mr. Robert Paton, "On the cultivation of the mind." Mr. Robert Scott very gallantly complimented "The Ladies." "Education" was treated of by Mr. Alexander Thomson; and Mr. Duncan West took a survey of "The characteristics of the last half century." These addresses generally displayed marks of careful study and considerable literary power. (Did your space afford it, you might introduce the following critical remarks. *) Singing, recitations, and instrumental music, were excellently interspersed with the addresses, and "all went merry as a marriage bell." Towards the close of the evening we were unexpectedly called upon to address the members, and made a few remarks upon "Self-duties." The meeting was most harmonious, and from the report of progress which was read at the meeting, this society appears to be most successfully conducted. +—THE AUTHOR OF "THE ART OF REASONING."

* We think it unadvisable to do so, not only on account of want of space, but also of the delicate nature of some of the remarks made by our able correspondent.

+ The lengthy though valuable remarks with which this notice finishes we have been obliged to retrench, but shall reserve them for use on a future occasion.—ED. B. C.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

78. Suppose A. bequeathed to B. an annuity for ~~as~~ and B. is still living, is it grammatical in making such a circumstance to say that "A. bequeathed the annuity to B. as long as he *should* live" or ought it to be "as long as he *shall* live?"—Vide Lennie's Grammar: Syntax, rule 5. Again, Lennie says, "Sentences that imply contingency and futurity require the subjunctive mood, but when contingency, and futurity are both implied, the indicative ought to be used."—Syntax, rule 10. Now, there is scarcely a day passes but I meet with sentences which appear to be irreconcilable to this rule. I should therefore feel much obliged either by you or one of our correspondents informing me whether or not I misapprehend the rule? References to Lennie's Grammar preferred.—H. H. F.

79. Will "Vinclum" inform a constant reader of the *British Controversialist* how he may obtain the sermon referred to in the first negative article on Homœopathy, also the price?

80. As I am desirous of gaining a practical knowledge of the science of Phrenology, perhaps some one of your kind correspondents will inform me how I should pursue its study, and what books I should obtain. I love the science, and wish to persevere in studying it.—G. G.

81. Without wishing to re-open the discussion of the question respecting the Trinity, I would direct attention to that passage in the negative reply on page 456 (Vol. II.), commenting with line 27, first column, and would respectfully solicit from "E. D. R." and "B. W." replies to the following question, grounded upon it:—If the Son was ~~necessary~~ to ask of the Father deliverance from his infirm humanity, does not such

necessity imply, not only a dependence on a Superior Being, but a recognition of that Being's will as independent to his own? If so, there is an admission, not merely of the Father's independent and superior will and power, but no attempt to claim the title to the Godhead. For God in his inmost essence or being is a unit, and can have but one infinite will, and as his esse is the only life in itself, and he cannot therefore delegate that only life to another—he cannot give away himself!—KIDDER.

82. Can any of your experienced correspondents point out to me the best method of acquiring a knowledge of the principles of conveyancing?—ORION.

83. Will you, or any of your correspondents, be good enough to inform me, through the medium of your excellent periodical, what is the probable amount of gold, in sovereigns and half sovereigns, at present in circulation throughout the United Kingdom of Great Britain and Ireland, irrespective of what may be held at the Bank of England? The question being in dispute, an answer in an early number will oblige.—W. T.

ANSWERS TO QUESTIONS.

71. *The Fabled Hebrew Wanderer.*—Byron doubtless refers in the lines quoted to the fabled Ahasuerus, who is thus described in a German fragment preserved by Shelley:—"Ahasuerus, the Jew, crept forth from the dark cave of Mount Carmel. Near two thousand years have elapsed since he was first goaded, by never-ending restlessness, to roam the globe from pole to pole. When our Lord was wearied with the burden of his ponderous cross, and wanted to rest before the door of Ahasuerus, the unfeeling wretch drove him away with brutality. The Saviour of mankind staggered, sinking under the heavy load, but uttered no complaint. An angel of death appeared before Ahasuerus, and exclaimed indignantly, 'Barbarian! thou hast denied rest to the Son of man; he it denied thee also, until he comes to judge the world.' A black demon, let loose from hell upon Ahasuerus, goads him down from country to country: he is denied the consolation which death affords, and precluded from the rest of the peaceful grave.

"Ahasuerus crept forth from the dark cave of Mount Carmel—he shook the dust from his beard—and taking up one of the skulls heaped there, hurled it down the eminence: it rebounded from the earth in shivered atoms. 'This was my father!' roared Ahasuerus. Seven more skulls rolled down from rock to rock, while the infuriate Jew, following them with ghastly looks, exclaimed, 'And these were my wives!' He still continued to hurl down skull after skull, roaring in dreadful accents, 'And these, and these, and these were my children! They *could die*; but I! reprobate wretch! alas! I cannot die! Dreadful beyond conception is the judgment that hangs over me. Jerusalem fell—I crushed the sucking babe, precipitated myself into the destructive flames. I cursed the Romans, but alas! alas! the restless curse held me by the hair, and I could not die! Rome, the giantess, fell—I placed myself before the falling statue—she fell, and did not crush me. Nations sprang up and disappeared

before me; but I remained and did not die. From cloud-encircled cliffs did I precipitate myself into the ocean, but the foaming billows cast me upon the shore, and the burning arrow of existence pierced my cold heart again. I leaped into Etna's flaming abyss, and roared with the giants for ten long months, polluting with my groans the mount's sulphureous mouth—ah! ten long months. The volcano fermented, and in a fiery stream of lava cast me up. I lay torn by the torture snakes of hell, amid the glowing cinders, and yet continued to exist. A forest was on fire: I darted, on wings of fury and despair, into the crackling wood. Fire dropt upon me from the trees, but the flames only singed my limbs; alas! it could not consume them. I now mixed with the butchers of mankind, and plunged in the tempest of the raging battle. I roared defiance to the infuriated Gaul, defiance to the victorious German, but arrows and spear rebounded in shivers from my body. The Saracen's flaming sword broke upon my skull: balls in vain hissed upon me: the lightning of battle glared furiously around my loins; in vain did the elephant trample on me, in vain the iron hoot of the wrathful steed! The mine, big with destructive power, burst upon me, and hurled me high in the air—I fell on heaps of smoking limbs, but was only singed. The giant's steel club rebounded from my body; the executioner's hand could not strangle me, the tiger's tooth could not pierce me, nor could the hungry lion in the circus devour me. * * * I now provoked the fury of tyrants: I said to Nero, Thou art a bloodhound! I said to Christum, Thou art a bloodhound! I said to Muley Ishmael, Thou art a bloodhound! The tyrants invented cruel torments, but did not kill me. Ha! not to be able to die—not to be able to die! Not to be permitted to rest after the toils of life—to be doomed to be imprisoned for ever in this clay-formed dungeon—to be for ever clogged with this worthless body, its load of diseases and infirmities—to be condemned to hold for millenniums that yawning monster Sameness, and Time, that hungry hyena, ever bearing children, and ever devouring her offspring! Ha!—not to be permitted to die! Awful avenger in heaven, hast thou in thine armoury of wrath a punishment more dreadful? then let it thunder upon me, command a hurricane to sweep me down to the foot of Carmel, that I may there lie extended; may pant, and writhe, and die!"—A. C.

74. *How to study Euclid.*—We will not undertake to inform C. M. what is the *best* method of studying Euclid, but only suggest what we conceive to be an *effective* method.

1. He should make himself familiar with the definitions.

2. Commit to memory every proposition as he arrives at it, in order that he may be able, without the aid of the book, to repeat it in support of any subsequent one.

3. He must not rest satisfied until he can draw the diagram upon a black board, and demonstrate the proposition to which he has come without the aid of the book. Unless he is able to do this, he will never effectively understand Euclid.—G. N.

76. *Facility in Composition.*—In answer to H. T. M., we do not think that translating languages, of which you say you know but little, would be a ready means of improving you in the art of composition; for in translating, all inex-

and their attention so concentrated, that they generally adhere to their own diction. We may use many more desirable methods. A little time and pains bestowed in imitating the thoughts of other men, by copying their orations, *not* well, but in preference, if you have your attention to the expression of your thoughts, by clothing them in different languages, selecting and adopting the best, and therefore the best. We have read the reading of some of our best authors, attended with great advantage, or noting down their ideas as they occur, afterwards endeavouring to express them in our own words, is good exercise. You are already conversant with the plan of Franklin (who succeeded in nearly everything he undertook); if you are not, it may be known, and if you are, it may be known by others. In his *genuine autobiography*, which may be obtained for a shilling, and read by every young man, in his early days, having fallen in love with a friend, he speedily acquired facility of style, and determined then to proceed to say: "About the year 1723, I had an odd volume of the Spectator, and never before seen any of them. I read it over and over, and was much

I thought the writing excellent, and if possible, to imitate it. With some of the papers, and making up sentences in each sentence, I copied them day after day, and then, without looking at the original, tried to complete the papers, using each limited sentiment as fully as it had been expressed in the original. I copied the able words that should occur to me, compared my Spectator to the original, and noted some of my faults, and corrected them afterwards. I took some of the Spectator, and turned them into my own words, to increase his stock of words; and when he had pretty well forgotten them, I turned them back again. I myself had also a desire to write, and of systematically arranging his words, sometimes jotted down his words, and after some weeks endeavoured to put them into the best order before me, and then wrote the full sentences, and compared them, by comparing his work with mine, and recovered, he says, many faults. I was not, however, but he sometimes had the good fortune, that in certain particulars of his style, he had been fortunate enough to have hit upon the method of the language." This

and with what success his method succeeded, the singular clearness of his style affords abundant evidence. If you practice in any of the methods mentioned, you may make considerable progress in your power of composition of thoughts. Do not expect to express at first. That which is at first a little difficult of attainment, the testimony of many of our best authors fully applies to composition, in his correspondence with

Sir James Mackintosh, says, "A style which is truly good, must always, more or less, be the result of effort and art." Dr. Johnson expressed himself equally clear—"What we hope ever to do with ease, we must first learn to do with diligence." Young has immortalized in poetry his conviction of the same truth:—

"Write and re-write, blot out, and write again,
And for its swiftness ne'er applaud your pen.

Time only can mature the lab'ring brain;
Time is the father, and the midwife pain."

We could adduce many other similar testimonies were it necessary; but first reflect upon what we have already said. You will find this magazine a ready medium for obtaining further assistance; and as you progress, you may, through its pages, speak to the world. We bid you God-speed, and ask you to reflect upon the words of a living author:—"How senseless must appear all efforts at excellence which are not made in the spirit of laborious application."—C. W., Jun.

The translation from one language into another is an excellent method of obtaining a knowledge of words, and the faculty of copiousness or variety of expression. Careful, very careful study of the classical works of our own language will also in time ensure the earnest student elegance and propriety of expression. But it is not in much *writing* nor in much *reading*, that H. T. M.'s chief hope of success lies, but rather in much *thinking*; and therefore we would recommend him to *digest* what he reads, never to lay a book aside until its whole meaning is understood. (Of course we speak only of such works as will repay this concentration of the mental powers, *others* are better left alone. Readers of this magazine will find it an excellent employment to peruse carefully all the articles, affirmative and negative, upon any one of the many subjects here debated; and, having taken note of the omissions, misstatements, &c., upon each side, to write articles embodying their own views of the matter. The works of Shakspeare will afford boundless scope for the exercise of the thoughtful mind. Let the student take up the best of his plays one by one, and study them in the thorough manner here indicated—revivifying those old historical characters once more, and sharing with them those soul-stirring scenes, not as they are *represented* on the pitiful stage, but as they *were*—analyzing their acts, and judging of their intentions—and then let him write a critique upon them. Such essays as these will show H. T. M. where he is deficient, and also teach him how to remedy his defects. We have not spoken of the great utility of correspondence, nor of many other means of obtaining the object of his ambition. We have simply shadowed forth one or two, and will leave him, like the alchemist, to turn to gold whatever opportunities of improvement he may meet with while engaged in the attainment of his wishes. Practice—yes, persevering practice—that is the secret of it all!—S. M. F.

78. *Grammar*.—In answer to the first question, the sentence should read—"A. has bequeathed the annuity to B. so long as he shall live."

With regard to the subjunctive, or elliptical form of the verb, we are no great advocates for its continuance in writing; more so as few who thus

use it would have the hardihood to do so when speaking. In the instances cited it is decidedly incorrect. The word "if" comes from the Saxon "gif," from which also our present verb, *give*, and *given*; and is synonymous with the latter; hence the sentences quoted would, if rendered properly, read so—"Given that such is the character of this historian," &c.—"Granted that," &c. Again, "Given that the assertion is true,"—"Granted that,"—"Acknowledge that,"—"Admit that it is," or simply,—"*Grant* that such is the case," then will such another circumstance take place, or be added.

When speaking of future contingent events it were (would be) better to use the proper auxiliaries, as—"If it *should* rain to-night, we shall not go home;" not "If it *rain* to-night," &c.

If H. H. F. look, or will look, a little above his quotation from sect. 2, col. 1, p. 459, he will find this sentence:—"If 'Justitia' means that the parliament was first to appeal to arms, I *deny* it."

Let him place the first-quoted sentence from this writer by the side of it, and he will find them to disagree, because "*can expect*" is in the present tense, as well as "*deny*" in the last.

We would advise our correspondent to put "Lennie" on the shelf a little, as we have done, and take to "Connon" and "Lathan." We used "Lennie" while in small clothes, but we wanted *tucks* to let down when we grew a little, but could not get them from the short-kilted Scotchman.

H. H. F. will not accuse us of knowing nothing of Lennie's works for saying this, when we tell him we used it for some years constantly; and consider it not the worst text book for rules in the language, but there is nothing of the philosophy of language to be found in it—no reasons given; it is simply a book of technicalities, to be swallowed whole, and digested at leisure.

Perhaps H. H. F. for the future will give not only column and page, but section and line; it will save much trouble.—E. B.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XII.

1. What is meant by "the doctrine of the Syllogism?"
2. Point out the difference between Language and Logic.
4. Enumerate the classes into which Objectivities may be arranged, and give illustrations of them?
5. What is a Syllogism, of how many parts does it consist, and how are these parts designated? Give illustrations.
6. Point out the difference between knowledge and reasoning, and state what would be man's condition without the power of reasoning.

GRAMMAR CLASS.

Design of Class.

This class has been established with the design

of assisting young men and others to a knowledge of the English language.

The plan which it is proposed to adopt is:—

- 1st. To furnish from time to time a succession of exercises, to be written by our students.
- 2nd. To receive and acknowledge the written exercises, taking care to note the success of each.
- 3rd. To keep a regular account of the progress made throughout the year, at the end of which the teacher will award certificates of merit to the ten most successful students.

Exercises in Grammar.—No. I.

1. Make out a form like that given below, and arrange the words of the following sentences in columns: placing the words of the same part of speech in the same column:—

PARTS OF SPEECH.

INFLECTED.				UNINFLECTED.			
Noun.	Adjective.	Pronoun.	Verb.	Adverb.	Preposition.	Interjection.	Conjunction.

Practice in parsing will in time produce perfection. If you practise parsing you will in time become perfect. The young man had many friends, but, alas! he heeded not their counsel. That humane person leaped courageously into the stream, but, alas! he was almost drowned. Attend diligently to your business and your business will repay you. "O my son," says an Arabic proverb, "take care that your mouth

breaks not your neck." The results of deep research or extravagant speculation, seldom provoke hostility when meekly announced as the deductions of reason or the convictions of conscience. As the dreams of a recluse they may excite pity or call forth contempt; but, like seeds quietly cast into the earth, they will rot or germinate according to the vitality with which they are endowed. But if new and startling opinions

are thrown in the face of the community—if they are entered in triumph or in insult—in contempt of public opinion, or in derision of cherished errors, they lose the conciliableness of truth in the manner of their propagation, and they are like the seed scattered in the hurricane, which only whips and blinds the husbandman.—*Sir David Brewster.*

MATHEMATICAL CLASS. QUESTIONS FOR SOLUTION.—II.

Arithmetic and Algebra.

5. Three boys, aged 16, 14, and 12, respectively, went nutting, and found 126 nuts in all, which they divided as their ages. Required each boy's share, and an explanation of the process.

6. A cistern has four cocks, two of which are adapted to fill, and two to empty it. If it be empty, No. 1 alone will fill it in six hours, or No. 2 alone in five hours. When full, No. 3 alone will empty it in four hours, or No. 4 in eight hours. In what time will the empty cistern be filled if all the cocks are set open at the same time—supposing the weight of a column of water in the cistern and the pressure of the atmosphere to be uniform during the time.

7. A ship worth £30,000 is damaged at sea to the extent of £17,000. A friend who owns $\frac{1}{4}$ of $\frac{1}{2}$ of $\frac{1}{2}$ of her, desires to know the extent of his loss, and the present worth of his share?

8. Given $x+y=16$, and $xy=65$, to find the value of x and y .

Geometry.

3. The diameter of a spherical piece of wood is 15 inches. Required the side of the largest cube that can be made out of it; and an explanation of the process.

4. The side of an equilateral triangle is 10 inches. Required its area, also the area of two circles, one inscribed, and the other constructed about the triangle.

Mechanics.

3. A stone is $7\frac{1}{2}$ seconds falling freely through the atmosphere to the bottom of a pit. How deep is the pit?

4. At what rate would the stone in Exercise 3 be falling at the end of 7 seconds, and what would be its momentum when it reached the bottom of the pit, supposing it weighed 1 cwt., the resistance of the atmosphere being unaccounted for?

Notices of Books.

The Dictionary of Domestic Medicine and Household Surgery. By Spencer Thompson M.D., L.R.C.S. London: Groombridge and Sons.

Although no admirers of the maxim, "Every man his own doctor," we must confess to having perused the first part of this work with interest. It seems designed to disseminate sound information respecting "the house we live in," about, the body, and for this reason we recommend it.

The Foundation, Construction, and Eternity of Character. By J. A. James. London: Hamilton, Adams, and Co.

This little tractate forms the substance of a lecture recently delivered in the town-hall, Birmingham, to an assembly numbering some 4,000 individuals, the majority of whom are said to have been young men. It is an able and eloquent production, and calculated to benefit every young man who thoughtfully peruses it. The following extract will be read with interest:—

"It is recorded of Francis the First of France that after his disastrous defeat in the battle of Pavia, by the Emperor Charles the Fifth of Germany, he announced the catastrophe to his mother in the following terse and magnanimous manner:—'Everything is lost, but my honour.' I was a saying worthy of a greater and a better man. Similar to this has been the reflection on oppression of others, amidst the calamities of human life—of men who, sitting down amidst the ruins of their fortunes, their prospects, and their hopes, have wiped away their tears, and, nobly rising in the consciousness of integrity, have said, 'I have lost everything but my character:' and with that

consciousness, such men are less, far less, to be pitied, than they who have risen to wealth upon the ruins of their reputation. No man can be said to be in abject penury who is rich in whatsoever things are lovely and of good report, while, on the other hand, neither wealth, nor learning, nor science, can dignify a man without character. This is the best capital with which to begin life—which affords the most reasonable hope of success in passing through it—and will yield the sweetest reflections at the close of it.

"If it were granted you, at your own expense and under your own directions, to lay the foundations and to raise the walls of some magnificent structure, which should attract the admiration of the world, defy the assaults of time, and hand down your name to future ages, what an object of ambition would be thus placed within your reach. But how much nobler in itself—how much more valuable to you—and how much more enduring—is that which is actually proposed to you by the will of God, and which is to be set before you this evening, in the lecture to which you are now called to listen.

"By CHARACTER we mean the prevailing and habitual qualities or dispositions of the mind, which express themselves in appropriate conduct, and distinguish their possessor from other men. The word character is therefore expressive of a genus, of which there are many species: such as the literary, scientific, heroic, and very many other varieties. In common parlance, however, the word is usually employed to designate moral qualities, for this is the meaning of the expression, 'He has lost his character.' In this sense we consider it in the present lecture, as indicative of moral and religious habits.

"If our description be correct that it consists of

prevailing and habitual qualities or dispositions—then, of course, a mere occasional act, however splendid an instance of good conduct it may be, does not constitute character—even though it should be also repeated occasionally at long intervals. A miser, for instance, may, under some very peculiar circumstances, be induced to perform an act of even munificent liberality, but it is not his *character* to be liberal. Acts are sometimes done by men so unlike their prevailing disposition, that we are astonished at them as phenomena which exceedingly perplex us when we make inquiry into their cause. Even good men, under the power of temptation, occasionally do things which are very unlike themselves, and contrary to their character, which, however, still survives the shock of these aberrations. General uniformity, consistency, and perseverance in good conduct, then, are essential to character. We have known cases in which some single acts of a bad man, have, to all outward appearance, excelled in magnitude and splendour, any of the single acts of a good one—but the former was only a diseased and spasmodic virtue, which exhausted at once all the strength of the actor; while the latter was the continued and natural action of sound health: or to change the metaphor—the one was the rare but imposing splendour of the comet or the meteor, which appears but for a little while and then vanishes away; while the other is the steady, continuous, and directive, though it may be less imposing, light of the pole-star. A fitful virtue is of little value, and yet it is all that some men have, who may not be totally abandoned to *bad* habits. Their minds seem to be ever in an intermittent fever, in which their cold and hot fits are in constant alternation.

“Having, then, endeavoured to show what we mean by character, and what kind of character we intend in this lecture, we proceed,—

“To speak of its **FOUNDATION**. This word is suggestive. The foundation of a building is laid in the earth. How much labour is bestowed in digging and throwing out the soil, and getting a trench ready to receive the materials which are to compose the fabric! How much material is lodged out of sight, that is totally forgotten by the ignorant observers of the structure? Who, for instance, in passing St. Paul's Cathedral, and admiring its lofty dome and gilded cross, dreams of the masses of stone on which the whole rests, and without which the building must soon have been a heap of ruins? Yet there is the foundation, vast and deep, though buried, hidden, and nearly forgotten. So must it be with character. The foundation must be laid in the mind, and heart, and conscience, and memory. There must be a digging into the soul—a throwing out of much that is in the way of what must be introduced—a making room for much material to be laid there—and a careful and laborious deposit of a suitable substratum. Something strong, broad, firm, must be buried and hidden in the soul. A lofty superstructure of character can no more be raised, which shall stand and be permanent, without this, than a towering building can be a permanent one, that is erected *upon* the surface of the ground, and not *beneath* it. The soul—not in its intellectual aspect and capacity merely, but in its moral and immortal one; the soul with its

affections, passions, and propensities; the soul as the seat of will and conscience; the soul as the ground in which the basis of character is laid; must be the subject of serious consideration. Many men carry about their minds with less solicitude than they do their watches: knowing and caring almost as little of the faculties and powers of the one as they do of the mechanism of the other. This must not be with those who would form a good character.

“Of what materials then must the foundation of character be formed? What are the mighty and granite stones which must be deposited, for a character that is to stand for eternity? Science? Literature? The arts? No. These may do for the intellectual, but not for the moral character. It is **PRINCIPLE, MORAL PRINCIPLE**. Moral character cannot rest on astronomy, geology, chemistry, electricity, magnetism. These things are admirable, useful, noble, sublime: but they can no more do for the basis of character, than jewelry, or diamonds, or the telescope, or the galvanic battery, or the magnet, would do for the foundation of a pyramid or a temple. By principle I mean not opinions only, but convictions: not speculative theories on morals, but practical conclusions: not sentiments floating in the judgment, but rooted in the heart. To attempt to form a character without established principles, is like erecting a building without a foundation.

“There are *decorations* of character to be studied and acquired. To advert again to the construction of a building, it may be made of substantial materials, and may have many good rooms, and answer well enough the purpose of a habitation, but all the while it may have a barn-like appearance. There are none of the tasteful ornaments of architecture—no Ionic grace—no Corinthian elegance, nor even Doric chasteness. Or to refer to the human form, there may be symmetry, strength, even beauty, but the bearing may be low and vulgar, the manners repulsive, and the address unprepossessing. Is it not sometimes thus with character? There may be the possession of sterling integrity, and great moral worth; in short, all the things that are true, and honest, and pure, and just; but not the things that are lovely. There is wanting the amiable temper, the courteous address, the attraction of kindness. It is a fine body in an uncomely dress; it is a lump of gold, but amorphous and unburnished; it is a diamond not cut and flashing with all the hues of the rainbow, but dull and covered with all its earthly encrustations. Character is the best thing on earth; why not then invest it with all the charms of which it is susceptible, and compel men to love and admire it as they do a jewel; both for its own sake, and for the sake of its beautiful setting also. The character of every man, far more than his wealth, is public property—and should be so exhibited as not only to attract attention, but to excite admiration and emulation. We must endeavour to make virtue loved as well as esteemed.”

We had marked other passages for extracts, but space forbids us giving them on the present occasion: the above will be sufficient to indicate the important character of the lecture, and the impressive style of its author.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. III. — THE PHILOSOPHY OF LANGUAGE.

In our last paper we endeavoured to show that the wondrous system of thought-symbols which we denominate Language, and which is to us at once the interpreter and embalmer of our ideas, is the result of a conjoint exertion of celestial and humanitarian agencies—that it springs forth from the human soul as gradually and mysteriously, yet as surely and naturally, as a flower, in fitting circumstances, is developed from its germ-origin—and that

" Man's soul the Almighty to the future set
By secret and inviolable springs."

"Thought is quick." Consciousness is continually impressible, and the soul is unceasingly voyaging into new regions of inquiry, and is constantly engaged in surveying provinces of Nature which have been hitherto unexplored. Farther, deeper, higher, man's adventurous spirit proceeds, his knowledge-thirst is unquenchable, his excitable intellect is unresting. In these excursions of the mentality—in this *exodus* of the "inquiring spirit"—new modes of being are discovered, fresh acquisitions of knowledge are made, strange appearances become mirrored in the mind, and novel conceptions are originated in it. Language becomes the custodier of such information. Thought is the bullion of the intellect, and words are the conventional paper currency which represents it.

" Each giving each a double charm,
Like pearls upon an Ethiop's arm."

Strange that words—the mere vibrations of that "thin air" which is the very image of transitoriness, should be the media of communicating that durable, yea, eternal, reality—Thought, and that these faint impulsions on the atmospheric enwrapment of the earth should be emblematic of the idea-products of our "inner life." But "it is not words only that are emblematic." Everything in existence *speaks* to the cultured intellect. Whewell truly observes, "Man is the *interpreter* of Nature; not the spectator merely, but the interpreter. The study of the Language, as well as the mere sight of the characters, is requisite, in order that we may read the inscriptions which are written on the face of the world." It is in striving to decipher these inscriptions, and to read off their teachings, that men of science are continually employed. Before, however, this dead Language of Nature can be understood by all, it requires to be translated into the lexicography of humanity, and hence these representative embodiments of thought—words. It is true that the imperfection of our knowledge may cause us to translate inefficiently, as the terms "vertices" and "vacuum" demonstrate; but Nature still continues to teach us by means of her own God-given though inarticulate Language. With our mental growth, however, the fidelity of our "rendering" increases, and our knowledge of the context enables us to

attach more accurate verbalisms to the exposition of what is written in the creation-phenomena around us. If Language is a collection of idea-emblems, the copiousness of Language will be in a ratio with the multiplicity of ideas possessed by a people. The want of a word could not be felt till a thought demanded expression for which man had no cognomen; or if words existed prior to the eduction of thoughts, then we should have the incongruous difficulty of having many signs previous to possessing a capacity to apply them properly to denote our newly-developed ideas. All Languages, therefore, must have been, in their earlier stages, scanty. As our ideas became more numerous, words would become more copious. As we became more accurately acquainted with the relations of objectivities, Language would become more complicated. "Because of this radical correspondence between visible things and human thoughts, savages, who have only what is necessary, converse in figures. As we go back in history, Language becomes more picturesque until its infancy, when all is poetry, or all spiritual facts are represented by natural symbols. The same symbols are found to make the original elements of all Language;" * for the organs of speech and of hearing are very nearly similar in their structure in all men—the same laws govern their understandings, and control the formation of their ideas—the purposes for which speech is employed are nearly alike in all, and the objectivities around them have a very considerable amount of resemblance; while at the same time it should be observed, that wherever natural phenomena or products, and social habits or instruments, differ in one country from those of another, the words significant of these phenomena, products, habits, or instruments, are always imported from the language of that other country, *e.g.*, Simoom, geyser, llanos, &c.; ennui, roué, incivism, sans-culotte, suttee, gong, soirée, slick, gutta percha, caoutchouc, &c. Each new discovery in science, each new phase of social existence, each new educt of human ingenuity, each new process of thought, each new practical art, each new relation of objects, requires either the invention of a new name, or else a new application of an old one; and hence, too, we deduce the inference, that *no sooner is a new thought implanted in the mind, than it germinates into a name.*†

Little evidence corroborative of the accuracy of this inference can be expected from

* Emerson's "Nature," p. 18.

† Illustrations of the accuracy of this inference may be found in the words employed to denote any discovery, invention, or custom, *e.g.*, *Isomorphism*—a term rendered necessary by the discoveries of Guy Lussac and Mitscherlich, as a sign of the fact that some bodies possess the quality of assuming the same crystalline form, though composed of different proximate elements, yet with the same number of equivalents. *Bilobate*—a botanical designation for a leaf which is divided into two parts by a notch. *Momentum*—the symbol, to the scientific intellect, of that quantity of motion in a body which is always equal to the quantity of matter multiplied into its velocity. *Barometer*—an instrument for measuring the weight of the atmosphere. *Tariff*—a term well known in commercial and political society as denoting a fixed rate of duty levied upon imports. *Tarifa* is the name of a promontory in the south of Spain, which, running into the Straits of Gibraltar, was in olden times employed by the Moors as a watch point of the Mediterranean Sea, from which, as any merchant vessel entered or passed out, they issued, and enforced a definite proportion of the cargo, according to the amount and kind of goods with which the vessel was laden. *Assassin*, which is derived from the Arabic words *Ahash-shash*, a smoker or eater of hemp; by this smoking or eating, intoxication is produced. During the Crusades some Arabian soldiers were in the habit of administering these intoxicating drugs, in order to render their enemies insensible, so that they might the more easily make them their victims.

historic annals. The want of written records—the all-absorbing influence which pressing wants and necessities, new circumstances and occupations, must have exerted—the novelty, anxiety, and uncertainty of man's new state of being—the stern need which they must have felt of staring real difficulties in the face, and adopting the readiest means to overcome them—afterwards the stirring fermentation of passion, which made the earth seem as if it were one vast cauldron of fierce, relentless, and unconquerable hate; then the migratory and predatory habits of the earth's early inhabitants, are all reasons why no account of the intellectual progress of our race could have been transmitted. We are thus left with little else than analogy to direct our inquiries. But man is naturally an analogist; he generalizes as instinctively as he specializes; and wheresoever the torch of history grows dim, or the light of ascertainable fact fails, he is irresistibly compelled to avail himself of the lamp of Reason and the clue-threads of analogy in traversing the mazy labyrinths of speculation.*

"Necessity is the mother of invention;" and it is seldom that the full force of the intellect is put forth, except under the pressure of this sombre step-dame. We have every reason to believe, therefore, that as man's nature and circumstances necessarily made inter-communication requisite, that immense efforts would be made to discover and invent some conversation-medium. We must recollect, too, that the human mind was at this time, so far as man's nature admitted, perfect, fresh from the mint of heaven, with the image of God superinscribed on it—that exertion was as delightful as it was new, and that the capacity of invention was unimpeded by any obstacle; no step had been taken, the mind had not been misled by dubious and tentative trials; there only remained, therefore, for the mentality to unfold the divine idea-germs which were enwrapped within it. And how could these fail to bud and blossom into speech, when new, varied, and attractive scenes everywhere met his eye—while Adoration, Love, and Friendship—a triad of paradisaical angels—quickened the growth of the soul! But we must beware of looking upon Language as it is now—a complex and intricate mechanism of idea-symbols—and then speaking of the difficulty of such an invention being an educt of human skill. How stately and majestic does the oak of a thousand years appear! how wide-spread its branches! how complicated its root-fibres! and yet it was once but an apparently insignificant acorn, divinely endowed, indeed, but wanting the due conjunction of place and circumstance to aid its becoming a venerable

To them the term was first applied, and it is now the cognomen of any one who basely attempts to kill his enemy by stealth. *Aburd* is primarily derived from *ab surdo*, i.e., from a deaf man; but as in a conversation the remarks which proceed from a deaf man are generally foreign to the subject, a notion of incongruousness arises in the mind, and hence anything superlatively foolish is likened to the conversation of a deaf man. Electricity, gravitation, angle of incidence, communism, calamity, imbecility, pagan, knave, villain, &c., may form a *praxis* for the same sort of exposition.

* In speaking thus, let it not for a moment be imagined that we impugn the sacred record; on the contrary, we, in common with the best biblical commentators, look upon *that* as decidedly favourable to our opinions, although we have no desire to draw down the oracles of God from their sacred height into the midst of contentious, and perhaps irreverent, disputationists. It has other and higher uses to perform—to instruct men as to the manner of the inner life—to unveil the moral laws of the Deity—to reveal the God-man, Christ-saviour to men—to open the gateway of immortality—and to make certain the doctrine of the after life, which is but faintly indicated in the book of nature. Spiritual Truth can never gain anything by descending from her own God-built temple to wrangle in the common market-places of the world.

forest-king ! So has it been with all man's earlier invention-achievements. The discovery of metals, and the invention of instruments of labour, home construction, the fine arts, social polity, &c., are equally enveloped in the vagueness of time-distance. Were we ignorant of the successive steps which had been taken towards the perfection of the steam-engine from the days of Hero of Alexandria (120 B.C.) to our own, how mysterious would the invention of such an agency appear ! Egypt's eternal pyramids, which have outbraved "a thousand storms, a thousand thunders," how were they up-reared ? By what unknown and marvellous mechanisms were these "piles stupendous" of massive masonry built in the world's young prime ? If obscurity can hang its shadow-clouds over topics such as these, can we expect to pierce the veil of age-accumulated darkness which encompasses the origin of one of man's earliest necessities ? Assuredly not ; nor is it needful. All that is requisite is to gain an analogical explanation sufficiently exact to guide our footsteps in the probable path. If, when we have followed out our analogy, we find that it complies with all the requirements of the case, we may have good reason to believe that our view has been correct. Let us tread this pathway circumspectly, taking "caution" as our watchword, and making the attainment of truth our only object. To eliminate the point of the probability that speech is semi-celestial and semi-humanitarian in its origin, it seems to us necessary to inquire what faculties possessed by man are capable of assisting in the origination of idea-representative sounds, i.e., speech. This point may, to some, appear unimportant, and they may feel inclined to cut "the gordian knot," by exclaiming, "Tush ! we have language now ; teach us rather how to use it as it is, than torture our minds with speculations as to what it was, and whence it proceeded. The practical—the practical—that is the pre-eminent want of our age." We have no hesitation in asserting, that properly conducted speculation must always, in the end, lead to important practical results. The laws of Theory justly deduced must be re-applicable to the facts of Experience ; and if Experience, when honestly and carefully interpreted, refuses to ratify the inferences, she is justly held to have refuted Theory ; but there cannot be any real and valid disconnexion between the speculations of the philosophic theorist and the truths of practice. Theory teaches the nature and use of the instrument with which practical skill operates ; a proper acquaintance with the nature of Language cannot, therefore, be foreign to practical and experimental purposes. It is not merely as a matter of curious philosophic speculation, but also as a point of considerable practical importance, that we proceed to lay before our readers one or two brief observations upon the faculties of man, which may be legitimately supposed to have conjointly co-operated in the production of those thought-exponents—words.

1st. *Perceptivity*. This faculty is the primary element in all human thought, and is, consequently, an essential co-worker in the production of speech. "All objects of all thought," whether resulting from a consciousness of internal powers, or of extraneous impressions, must become so by being brought before this—the mind's eye. Truths, i.e., impressions from within and without, impinge upon the mind without regard to order, regularity or sameness. Occurring thus indifferently, they form a mazy and undistinguishable mass until Perceptivity, contemplating the similarities of the impressions, classifies them accordingly, and thus renders them subdivisible. This chaotic series of impingements on the human consciousness being thus reduced into manageability by the perception of

identity, the mind acquires a capacity of forming classes of objects, and general ideas of such classes. Thus do *ideas* originate—thus are they individuated; each internal and external sense has brought its offering into the treasure-house of thought; but there is yet required a mental *form* in which to contain them—a registrative mark in Memory's tablets. "If we want to render a particular combination of ideas permanent in the mind, there is nothing which clenches it like a name specially devoted to the purpose." Words serve "to give a point of attachment to all the more volatile objects of thought and feeling. Impressions, that when passed might be dissipated for ever, are, by their connexion with language, always within reach. Thoughts, of themselves, are perpetually slipping out of the field of immediate mental vision, but the name abides with us, and the utterance of it restores them in a moment."

2nd. Societarian Instincts. We have seen in the last paragraph that thought-exponibles are necessary to man, even in an isolated state, as the recorders and mementoes of experience; when, then, we regard man as a gregarious animal—as being specially adapted for the interchanging of "the gentle offices of patient love"—as possessed not only of the power of being mutually helpful, but also of the desire of being so—how much more necessary—how much more essentially requisite—to him will it appear! How powerfully do love, friendship, and all the delicate emotions of the human mind stir up the intellect! The sameness of feelings, wants, &c., all minds being nearly similarly impressed, all hearts being agitated by nearly identical desires, would naturally produce a readiness of apprehension, and easiness of early intercourse, of which we, at this day, can form little idea. Every day we observe how readily ideas are communicated between parties of reciprocal sentiments. We need only mention "the language of the eyes" as an illustration.

3rd. Analogical Faculties. "The elements of the natural language of mankind, or the signs that are naturally expressive of our thoughts, may, I think, be reduced to these three kinds—modulations of the voice, gestures, and features. By means of these, two savages, who have no common artificial language, can converse together; can communicate their thoughts in some tolerable manner; can ask and refuse, affirm and deny, threaten and supplicate; can traffic, enter into covenants, and plight their faith. This might be confirmed by historical facts of undoubted credit, if it were necessary."* The way in which this communication would take place must be accounted for in some such way as the following:—Self-consciousness reveals to us the fact that when we are mentally affected in a given way, that mental affection produces certain changes in our bodily frame; when therefore we see any party displaying any external bodily change, similar in its general aspects to that produced in us by any mental excitation, we immediately conclude that the internal feeling of that party corresponds with that felt by us when the external man was affected in that particular manner. The natural language of children, who denominate animals by names indicative of the sounds which they emit—the method of communication between the deaf and dumb—pantomimic performances—the significance of oratorical gesture—are all so many instances of this exercise of the analogical faculties, so many keys to the understanding of the process by which the interchangeability of thought was managed in the prelingual age, so many indexes to the method in which the analogical

* Reid's "Inquiry into the Human Mind," chap. iv. sect. ii. p. 55.

faculties would operate. Again, we should recollect that the greater part of human language is analogical: thus we say lion-hearted, chicken-souled; thus we speak of the depth and acuteness of the mind, the hardness of the soul, the sweetness of one's temper, cold-blooded, hot-headed, &c. We speak of storms, tempests, &c., as denotative of states of mind. The early language of all countries is figurative—the early literature of every country is poetical; but poetry and figurative language are products of the analogical faculties. We have every reason to believe, then, that in the primeval ages of the world, the resemblance-perceptive powers of the mind were more powerfully active, were more energetically stimulated, than now, and consequently that they were more capable of originating audible thought-signs than now. And even now how expressive may Language be made when moulded by the imitative power of genius;* *e. g.*:—

“ *The precipice abrupt,
Projecting horror on the blackened flood.*”—*Thomson's Summer.*

“ *Seen from some pointed promontory's top.*”—*Ibid.*

“ *The huge round stone, resulting with a bound,
Thunders impetuous down.*”—*Pope's Essay on Criticism.*

4th. The Colligating Faculties. The phenomena of outward nature impress the mind, each class of objects possesses the power of making specific impingements on the mentality, and to these the intellectual faculties would first give names. When, however, the mind perceived that some objects possessed the properties of two different classes, or when it was under the necessity of conjoining two different thoughts together, it would do so by colligating the two thought-emblems by which these had been individually indicated in the mind. We have examples of such colligations of two thought-signs as the expositives of new ideas formed by the conjunction of two different objectivities or ideas, in the terms, *steam-engine, sky-blue, table-land, rail-way, self-taught, matricide, rock-bound, &c.*

It must be evident, from our foregoing remarks, that we believe that the power of embodying ideas in words, and thus enabling the thought-possession of one man to become the property and inheritance of the whole human race, is one of the divine germ-seeds which has been implanted in the human mind, and which, like the powers of perceptivity, judgment, and reasoning, is bestowed upon man in order that he may by

* We abstained from quoting in the text any examples from other languages; the following lines, however, are exceedingly expressive:—

“ *Βῆ δ' ἀέων παρὰ θινὰ πολύφλοισβον θάλασσαν.*”—*Iliad*, book i.

“ *Illi inter sese magna vi brachia tollunt.*”—*Georgics*, book iv.

“ *Quadrupedante putrem sonitu quatit ungula campum.*”—*Æneid*, book vi.

“ *Français, Anglais, Lorrains, que la fureur assemble,
Avançaient, combattaient, frappaient, mouraient ensemble.*”

Voltaire's Henriade, chant. vi.

“ *L' horror, la crudeltà, la tema, il lutto
Van d'intorno scorrendo: et in varia imago
Vincitrice la morte errar per tutto,
Vedresti, et undeggiar di sangue un lago.*”

Tasso's Jerusalem Liberata, canto ix.

culture and industry adapt it to useful purposes, and apply it to the upbuilding of his soul in knowledge. So far forth it is an emanation of the Creator's omniscient wisdom and all-prevalent benevolence. We can have no faith in the opinion that a number of the members of the human family—feeling the want of a medium by which barter, interchange, and business, might be facilitated, principles of government adopted, and inter-fraternal laws discussed and definitively agreed upon—in solemn convocation assembled, laboriously upplied a series of thought-representatives called words. The principles of the human mind, and the history of social life, both seem to us to present full warrant for deciding that such a method of procedure is exceedingly improbable. Men cannot invent signs for thoughts until they have them; they cannot have them anterior to experience; and ever as a want makes itself pressingly felt, the specific remedy is never long in being invented. Now, experience can only be attained gradually, wants can only be felt after experience; therefore the supplying of man's wants can only be gradually accomplished. In Language, as in every other object of speculation, no forces are to be assumed except such as are in present operation, or of whose operations there remain palpable evidences; and wherever an interpretation can be found in accordance with laws or forces now operating, that interpretation is to be preferred to any other in which assumptions are made. We believe that our solution of the question at once accords with the forces or laws now in operation, explains all the phenomena involved in the question, is in harmony with the teachings of the divine record, and in agreement with the laws of speculative human reason. In the early stages of human progress, when men speak from their emotions rather than their reason, few words are necessary, for the light of imagination flashes its illuminating radiance on all things, and makes even the hidden links of thought visible. This accords with the facts, that the ancient languages are less copious than the modern, and that poetry is the earliest species of literature which is evolved from the mind—and we humbly presume that our remarks have been sufficient to prove that Language is at once of semi-celestial and semi-humanitarian origin.

Philosophy.

IS HOMŒOPATHY TRUE IN PRINCIPLE AND BENEFICIAL IN PRACTICE ?

AFFIRMATIVE ARTICLE.—III.

HOMŒOPATHY must die—"Vinclum" hath declared it. The defenders of the system may now prepare their weepers; for though there are more truly eminent men amongst them than there are hairs on "Vinclum's" head, yet is the system doomed to destruction. Has not "Vinclum" proved to the satisfaction of every one who knows nothing about the subject, that Homœopathy is a delusion and a snare? and that its supporters are fit only for the "limbo of fools?"

Even its founder, who was justly considered to be a man of learning and experience in his profession, is politely and reverently called an aged simpleton by this learned champion of "*Old Mortality*."

But, to be sure, we are taught that lessons of wisdom may be learned from even the errors of others; and we will therefore set ourselves to discover how much of this honey we can gather from the carcass before us.

What, then, says "Vinclum" on the demerits of the system under debate? Why, just this:—1st. That Homœopathy is an absurdity and an outrage on common sense; 2nd. "That the claim of originality in the treatment set up by Homœopathists is no less unfounded than their other assumptions:" for "it has been practised to a certain extent from the earliest times, and is suggested by the common sense of every person who gives the subject a moment's consideration." How consolatory to know that we shall not be the sole tenants of that dreary place, the "limbo of fools!" "Vinclum" and Co. will not only accompany us, but actually have a prior claim to possession: to which we resignedly submit. For "Vinclum" first says our system is absurd; and then in the same breath contradicts himself, by saying that the system, or the mode of treatment (which is an integral part of it), has been practised since the earliest times, and commends itself to the common sense of every one who gives the subject a moment's consideration. Was any man ever so inconsistent! Surely "Vinclum" is but playing a practical joke upon us.

"Vinclum" proceeds to say—"But even admitting their therapeutic treatment to be feasible, or perhaps *advisable*, we must protest most emphatically against the globular part of the business." Now, we notice this simply for the purpose of telling "Vinclum" that he has surrendered his position; and that, having admitted that the Homœopathic treatment is "feasible," and "even advisable," he has forfeited his right to protest, either emphatically or otherwise, against the "globular part of the business." For, be it known to our friend, that what he calls their "therapeutic treatment" is, and what he calls the "globular part of the business" is *not*, an essential part of the system, as C. W., Jun. has shown:—"The fact is, that Homœopathists themselves are not yet quite agreed on the subject, though they all agree that in most cases *some* good effect may be expected from the *smallest* doses, provided that a really suitable Homœopathic remedy be used." "That they are not agreed concerning the *magnitude* of the doses is not surprising, for it is probable that by the habit of taking medicine on the ordinary plan, some persons become peculiarly unsusceptible to Homœopathic doses. It is also possible

that different individuals, and yet more, different nations, vary in sensitiveness. For all these reasons it seems necessary, at least at present, that Homœopathists should adapt the strength of their doses to the constitution of their patients."* It is added, that Hahnemann at first used doses of the ordinary quantity, but finding them very highly to aggravate the complaint, without any corresponding advantage, he made them smaller and smaller, till, after innumerable experiments, he found himself forced to reduce them to a minuteness such, that, for want of a better name, they have been called infinitesimal.

But, in fact, what care we at all about the *a priori* absurdity of the system, if its practically beneficial character be susceptible of proof? Every new system has been assailed with the same cry. Even Harvey and Jenner were voted very absurd characters, till men grew a little wiser. But much as "Vinclum" has to say respecting the absurdity of the system, he has not one word to spare on the statistics of mortality, as regards either the wise old system or the absurd new one. At the risk of making an actually too long an article an unconscionable length, we will endeavour to supply the omission. Our authority is Dr. Epps, of London:—"Professor Henderson, of the Edinburgh University, has shown that in nine hundred and nine cases of inflammation of the lungs, treated upon the established system, no fewer than two hundred and twelve died; that is, nearly one out of every four: whereas, in two hundred and ninety-nine treated on the Homœopathic system, only nineteen died, or one out of every fifteen cases. In one hundred and eleven cases of pleurisy treated upon the old plan, fourteen deaths ensued, or about one in eight; whereas, out of *two hundred and twenty-four* cases of the same malady treated Homœopathically, there were but *three deaths*, or little more than *one in one hundred cases*. Again, in twenty-one cases actually occurring in the Edinburgh University, upon the old plan, there were six deaths, or more than one in four; whereas, in one hundred and five cases of the same malady treated Homœopathically, there were but five deaths, or *one in twenty-five*

* S. C. Davids, M.D., Graduate of the University of Glasgow, and Licentiate of the Royal College of Surgeons of Edinburgh.

ses! In Cincinnati, Ohio, the patients treated for Asiatic cholera, by the Homœopathic practitioners, in 1849, were two thousand four hundred and ten, and they lost only eighty-five, or *three and a half per cent*: whereas the average loss under the allopathic system was *one in three* patients, and sometimes the loss was greater."

Now, I contend that these statistics prove the beneficial tendency of the system; and I wish to ask "Vinclum" how he will recon-

cile with these results his assertion that the system "is founded upon imperfect deductions from a few simple facts," and "that the every-day experience of the commonest practitioner is directly at variance with its fundamental laws?" If it be so, "Vinclum" can prove it by showing vastly superior results; and, failing his ability to do that, he must acknowledge that Homœopathy is both "true in principle" and "beneficial in practice."

IRENE.

NEGATIVE ARTICLE.—III.

It was our intention, subsequently to writing one of the opening articles on the above question, altogether to abstain from any future interference in the debate which might ensue; but the inaccuracies with which the first affirmative paper teems, no less than the thread-bare fallacies by which C. W., Jun., endeavoured to substantiate his position, compelled us, though unwillingly, to attempt a refutation.

The flimsy analogy which the latter writer attempted to draw between the illustrious discoverer of the circulation of the blood and the notorious founder of the Homœopathic system; the hacknied reference to the peroration of great minds and great ideas in times bygone—times of ignorance, delusion, and superstition; have contributed to lower considerably in our eyes a cause which even previously had fallen far below zero.

Shall the touching incident of the aged philosopher, who on his bended knees was compelled, by the dictatorial power of a religious tribunal, to abjure the sublime law which had cost him his life to investigate; the cruel opposition of an interested clique of professional brethren to the author of the execution, be cited as parallelisms to the success of a system which, after having shirked, as long as it was able, the decisive tests which have at length unveiled it, would now sink away from well-merited contempt beneath such a cloak as this, and nestle like an incubus on the bosoms of those whose ignorance exposes them to its impositions and absurdities, from which their superiors and education are better able to defend themselves? No; though the antagonism which must always be developed contemporaneously with the germination of the seeds of error has caused the medical profession to be on

the *qui vive* with regard to Mesmerism, Hydropathy, and the legion of other heresies to which these latter days have given birth, and which, from the small amount of truth they contain, are only the more dangerous, it is otherwise with the Infinitesimal theory.

We remember hearing a clever Romish priest endeavouring to inculcate on his audience the idea that the Church of Rome must be the only true one, as she was the most persecuted of all churches. "Brethren," said the doctor, "men" (referring more especially to the Church of England) "have always hated us as the devil only can hate truth. It is not so with the other sects, with the Dissenters, with the Baptists, the Unitarians, or with the disciples of Johanna Southcote; *they are simply despised*." So it is with Homœopathy; we treat it not as we do the other systems, which our opponents could claim as of cognate origin with themselves: we simply despise it. *They* ignore in their statements the plainest laws of science and the dictates of common sense; can we do otherwise than view it in the light with which its followers have illuminated it?

We must confess that there are some sentences in G. V.'s paper that have completely staggered us; the farrago of bad logic and coarse science which he has succeeded in concocting is rather more than we could have conceived possible of any man, last of all of a Doctor Medicinæ.

He tells us that Homœopathy emancipates mankind from ills unnumbered, "by regulating the provision of aliment, from which it discards all medicinal and stimulating substances," &c. How, in the name of all that is incongruous, does he define a stimulant, and how medicine? We always thought that all aliments were more or less stimulating.

Surely G. V. will not deny this property to articles of which it is to be supposed he often partakes, viz., roast beef and plum pudding? For ourselves, to our cost have we often regretted the excessive stimulating qualities of viands in which we have been tempted to indulge above measure. But perhaps he may fall back on the quibble, that these are natural stimulants, and he refers to artificial ones. Granted: but is not medicine in all its forms a stimulant, and an artificial one too, whether it be administered Allopathically or Homœopathically? And it is useless to allege the excuse, that given on the former principle it is much more injurious than on the latter, on account of the increased quantity of the dose; because, according to their own showing, it is the very minuteness of the Homœopathic globules which constitutes their efficiency; *ergo*, the reckless manner in which we administer our remedies is a sure safeguard against any ill effects accruing from them. If medicine be discarded, what, we should like to know, are the innumerable tinctures, powders, &c., which are comprehended in their pharmacopœia? Non-stimulating aliment, we suppose!

"Man was ordained by nature to suffer," (we very much doubt it,) therefore Homœopathy "was designed to free him from all those sufferings to which his own folly and superstition have hitherto made him a martyr." If ignorance had been the original sin, our first parents would, in all probability, never have been expelled paradise; but, unfortunately for our writer, Adam sinned, not through a deficiency of knowledge, but from an unholy thirst for more.

So, after all, the real prop of the Homœopaths seems to be that they pay *especial attention* to the diet of their patients. We do verily believe that these globules are only a pleasant subterfuge, under which they expect to escape from the charge of not giving their patients any medicine at all. They have at last arrived at the great secret, that the repair of nature's organism must, to a considerable extent, be left to nature herself: but, unwilling to abandon that superstitious enthrallment in which a medical man holds the majority of his patients, the immense influence which he exerts over their minds by the mere prescription of anything in the shape of physic, they have resorted to this—we must say unworthy—plan of preserving

what may be deemed their hereditary caste. Ah, gentlemen! take a friend's advice; show your true colours; enlist yourselves with the Hydropathists and Vegetarians, and you will stand a much better chance of succeeding than you do at present.

We had intended to draw our readers' attention to the fallacy, that "Homœopathy will in no case do positive injury;" but it has been so well handled by the writer of the last negative article on the subject—whose paper, by the way, is to our mind a carefully-written digest of most of the facts connected with the case—that we do not feel it necessary to do so.

Our opponents are very fond of insisting on showing their hospital books, and other such-like testimonies to the number of their cures, as a proof of the successfulness of their plan of treatment. But there is one thing which must never be lost sight of (laying aside the fact that the nature of the organism to be acted on, the varied character of the symptoms of a disease, the purity of the medicines, which in no case can be absolutely guaranteed, together with other collateral circumstances, render any inquiry of this kind so complicated as to make it of little or no practical value), that the tendency of most acute diseases, the class more likely than any other to come under inspection at Homœopathic hospitals, is to recover. Besides, *post hoc* is not necessarily *propter hoc*; if it were, what marvellous effects might not in justice be attributed to agents which we know possess of themselves no intrinsic value, but only so far as they help to bring about a combination of favourable conditions.

G. V. lays great stress upon the importance of Homœopathic medicines as *specifics*. We need hardly call the attention of the scientific reader to so palpable an error. Every person knows that one rational cure is worth half-a-dozen empirical ones. What is a specific but an agent empirically used to produce an effect, which, up to the time of so using, it has been more or less successful in producing? But how can we ensure its success in this, it may be the hundredth time of employing? True, it has been successful in ninety-nine cases, but may it not fail in the last? In this it differs from rational medicines, that the latter are uniformly constant in their action and certain in their effects. The word is a remnant of bygone days, and recalls the

darkness of the early dawn of our profession; but who would not wish to see it expunged from the medical glossary? There is no denying that we have specifics even now, and that we use them as such; but it is only a proof of how far we yet are from a perfect insight into the working of nature's machinery. When the qualities and action of therapeutic agents shall have been more thoroughly investigated, then may we hope to see some light shed upon a subject, where, as yet, every additional footstep only leads to a more inextricable confusion. Till then we must remain content; but let us not invite back the genius of bygone superstitions, by reintroducing terms which are only expressive of her former reign amongst us.

As to that display of grandiloquence with which G. V. finishes up, it is worth nothing; not absolutely worth the pen, ink, and brains which have been squandered on its production. It is worse than worthless, for it levels its writer to the grade of those penny-a-liners who dignify, by similar compositions, the Pantechmetheca or the Eureka shirt. If G. V. really wishes to advance Homœopathy, or any other pet system, we would advise him to enunciate propositions which have something more tangible about them, than such as the most wretched caterer for literary tradesmen could rival, if not surpass.

We had intended to have alluded to many more perversions of truth which, "thick as leaves in Vallombrosa," are plentifully woven 'mid our opponents' arguments: but lack of time, and worse still, want of space, authoritatively forbid our entering further upon the subject. With one more reference we must conclude, and it is to the uncharitable sentence in which C. W., Jun., charges us with a mercenary motive in rejecting Ho-

mœopathy. Like other writers whose wit outruns their wisdom, he has been led into an error which we will venture to say the veriest tyro in such matters could not avoid discovering. We know, and the public know too—at least it ought to know, only it shuts its eyes blindly to the fact—that under the old system, and too often under the improved state of things, medicine is sent and charged for which is not absolutely necessary. This has been, and will be, until affairs are better managed, the opprobrium of the profession. But can people grumble at a practice which they alone are instrumental in retaining? If they will not pay a medical man for his time, which is inestimably precious, for his health, which is equally so, and for an expensive education, can they complain if the fee which is so fairly due for professional advice, is grudgingly extorted by means of unprofessional bills for unnecessary items? The lawyer, and all other servants of the public, charge for their time, and why should not the medical man do so as well? He must be paid, and if John Bull will not loose his purse strings to the claims of a gentleman, he must "come down," and to the cost of his wretched stomach too, with his gold to the debtor and creditor account of the tradesman for "value received." When the English public shall have been imbued with a more liberal spirit, and shall have learned to treat with becoming confidence men who hold, not the political rights, but the lives of its members, in their hands, then, and not till then, will the bond be severed, and one long peace arise, to the emancipation of the physician from the trammels of the apothecary, and the surgeon's scalpel from the druggist's mortar.

VINCULUM.

PURSUIT IN LIFE.—No life can be happy, but that which is spent in the prosecution of some purpose to which our powers are equal, and which we, therefore, prosecute with success; for this reason it is absurd to dread business, upon pretence that it will leave few intervals for pleasure. Business is that by which industry pursues its purpose, and the purpose of industry is seldom disappointed; he who endeavours to arrive at a certain point, which he perceives himself perpetually to approach, enjoys all the happiness which nature has allotted to those hours, that are not spent in the immediate gratification of appetites by which our own wants are indicated, or of affections by which we are prompted to supply the wants of others.

History.

CAN THE APOSTOLIC ORIGIN AND NATIONAL INDEPENDENCE OF THE BRITISH CHURCH BE PROVED?

NEGATIVE REPLY.—III.

IN availing myself of the right of replying in this discussion, I must express myself at a loss to find matter to fill a page, inasmuch as our friend, J. B., has left me little or nothing to refute. He has adduced no argument or proof to show that the present Church of England is constructed after the apostolic model; but has simply contented himself with bringing forward certain very unsatisfactory statements, said to have been written by certain fathers in the second and following centuries. And what would those statements prove, if admitted as satisfactory evidence in this discussion? Why, simply this:—that some of the apostles did preach in Britain—a fact that requires much more proof than J. B. has been able to produce, before it can be believed by an inquiring mind. But, for the sake of argument, let us admit that J. B. has shown that St. Paul or some other apostle did preach in Britain; of what use is such an admission in determining that the present Church of England is more apostolic than her compeers in this realm? Merely the fact of an apostle having preached in England, can be no warrant for our supposing that the arrogant claims of the Anglican bishops, and the would-be-called Anglican priests, are derived by descent from the apostles. Such an idea is too preposterous to be entertained, and J. B. has studiously avoided putting it forward. Why, then, try to dazzle our minds with long statements about the bare probability that an apostle did honour this island with his presence? Did our friend wish to draw us away from facts, to amaze us with religious fictions? Let him show us that the parent Church of

England is apostolic in her constitution, her forms and her ceremonies, and that she approves of nothing but what the apostles themselves taught and sanctioned, then, and not till then, shall we be inclined to allow that he has made out a case which in any degree militates against the arguments which have been already advanced.

So long as such a proceeding as that lately enacted at Frome can be tolerated in the English Church, and so long as the English bishops usurp all power in our church, so long must we contend that she is far less apostolic than the majority of the sects.

The simple criterion of the apostolic character of any church is not profane history, but the word of God; and so long as any church countenances, by her usage and her laws, customs at variance with the New Testament, it is futile for her members to arrogate for her the proud title of the one apostolic church.

Doubtless the Church of England holds all the doctrines the apostles taught, but, alas! some of her formularies sanction matters the apostles would have scorned to allow. And too many of her sons hold doctrines which are diametrically opposed to the truth; consequently we contend that she cannot substantiate the claim of being more apostolic than the Dissenting churches.

Her freedom is the freedom of a serf; she is governed by the Queen and Parliament; and so long as she receives all her pay from the state, so long will she be under the power of the state.

It remains for J. B. to prove the contrary.
W. T.

AFFIRMATIVE REPLY.—III.

A FEW words in reply to the view taken by W. T., in anticipation of the affirmative article in No. 21, and to the letter of "Scrutator," in No. 22, will bring my remarks to a conclusion.

W. T. says, "The proud claims now put forth by High Churchmen lead us to inquire, where are the proofs that the English Church is the only apostolic church in this land?" He seems, by this remark, not to be aware

that the view I took in my first article is held by many Low Churchmen: in fact, to my knowledge, by several clergymen who rank high among the "champions of Protestantism." This being the case, the "High Churchmen" merit a moiety only of W. T.'s castigations. The question has no connexion whatever with "apostolic succession," and therefore I shall only make a passing remark upon what W. T. adduces in opposition.

That the government of the Primitive Church was episcopal I firmly believe. Of course, it does not come within my present purpose to offer my grounds for that belief: nor do I see that the article of W. T. bears at all upon the fact, which I endeavoured to prove in my first article. How does it happen that, during all the heresies and divisions in the first *fourteen* centuries, not one was found to deny the authority of the bishops? What can we imagine to be more likely than, when an heresiarch failed to obtain the sanction of a bishop, he should proclaim that the episcopal government was not apostolic? We do not, however, find that one did so; but, on the contrary, the utmost anxiety was shown for their concurrence in all matters. That the present state of our episcopate does not disprove the doctrine of apostolic succession, is, I think, evident. If the argument be good, what was to have prevented a Jew of the time of our blessed Lord denying the authority of the chief priests and scribes, who then bore authority in his church? The injustice and malevolence they displayed in their treatment of the Son of God—their hypocrisy—their practical neglect of the most positive commands of Jehovah, by demanding obedience to traditions which rendered these commands of no effect, would surely have justified a conscientious servant of the Almighty in disregarding their authority. Yet what is the language of Christ himself on this point? Matt. xxiii. 2, 3. "The scribes and Pharisees sit in Moses' seat: all therefore whatsoever they bid you observe, that observe and do; but do not ye after their works: for they say, and do not." The injustice of the high priest Ananias, in commanding the bystanders to smite the "great Apostle of the Gentiles" in the mouth, was surely a sufficient crime for the reproof which was administered to him. Yet St. Paul deems it necessary to make the apology that "he wist not" . . . "that he was the high

priest." No conduct could be more in opposition to the law, or to the example of the great Lawgiver—"the meekest of men"—of their nation, than this; but, even in such an extreme case, the law, "Thou shalt not speak evil of the ruler of thy people," was strictly applicable.

The Jewish Church was, in every respect, a type of the Christian Church. Our blessed Saviour came into this world purposely to establish the latter. "He taketh away the first," says the apostle, "that he may establish the second." He has taken away the law and the legal priesthood, that he may establish the gospel and the evangelical priesthood. The authority of the former, which was only "a shadow of good things to come," all acknowledged, and I cannot entertain the idea, reasoning from analogy, that the christian priesthood was to be less privileged. Will W. T., then, affirm that because our bishops are not so many "lowly men," that the *church* is not apostolic? It would not be difficult "to point out the fallacy" of W. T.'s argument with reference to the independence of our church; but he will have learned, since his article appeared, that he misunderstood the meaning of the term as I used it.

We next proceed to notice "Scrutator's" article. He finds fault at the onset with our witnesses, and calls exactly similar testimony to his aid. I shall not be deemed presumptuous by your readers, if I direct their attention to the works of Inett, Stillingfleet, Barrow, Mason, Beveridge, Lloyd, Hales, Owen, and Burgess, for the purpose of examining this important part of our early church history; and I think they will find in them the following position established, viz., that the arguments in favour of the preaching of St. Paul in Britain are so strong, as not to admit of a doubt in the minds of those who have duly studied the question, aided by the researches of the *Welsh archaeologists*; whilst the claims in favour of Joseph of Arimathea and Aristobulus, as advanced by Cressy and others, are now generally deemed unworthy of notice. With reference to Joseph of Arimathea, we may mention that Bishop Stillingfleet, in his "*Origines Britannicæ*," chap. i., has ably examined all the circumstances connected with tradition, and has satisfactorily proved the improbability of his mission to this country at all. No mention

is made of it by Gildas, Bede, Asserius, Scotus, Marianus, or any of the early writers. Sancto Paulo, in his Sacred Geography—Great Britain—treats the story of Joseph of Arimathea as a complete fable.

When speaking of St. Paul's visit to Spain, "Scrutator" says,—“But is our friend not aware that it has been a disputed point with bible students, as to whether the country there referred to is the same as the one known to us by that name?” I must confess my ignorance, and feel proud that in doing so I agree with such men as Dr. Adam Clark, Dr. McKnight, and others: in fact, there seems to be no doubt in the minds of our best commentators on this point. “Scrutator” directs my attention to the Triades. I have before me a book on the British Church, written by a Welsh clergyman, a thorough Welsh scholar, who maintains the same view as I have put forth. He often mentions the Triades, but still believes in the apostolic origin of the British Church. It is highly probable that Brân invited St. Paul to visit Britain (he being his contemporary prisoner at Rome), and that he afterwards consecrated Aristobulus a bishop for the Britons.

“Scrutator” will know, ere this, that the superstructure I have reared on the carefully laid foundation does not contain, because it was unnecessary, what he ironically calls a “holy thing.” My only object was to put forward, in a tangible shape, what I had been led to believe, after long and careful study. I will just close the question by briefly recapitulating the chief points I wish to impress on the minds of those who have read my articles in Nos. 21 and 22.

The church in our favoured island was planted by St. Paul, shortly before A.D. 61. That she flourished in the second and third centuries. “In the fourth century some of her faithful children received the crown of martyrdom, during the Diocletian persecution; and, on the accession of Constantine to the throne of the Cæsars, we find her recog-

nised as a portion of the great christian community by all other churches, her prelates regularly attending her councils, and subscribing their decrees and canons. In the fifth century, owing to the sanguinary devastation of Britain, first by the Picts and Scots, and subsequently by the Saxons, the church for a time became partially obscured, and shrunk before her enemies within the remote fastnesses of Wales and Cornwall.”

Augustin, on his arrival, found a christian church, possessing, as we do at present, an apostolical priesthood. The bishops and clergy would not acknowledge his authority, for which some 1,200 priests and monks were cruelly murdered. At the Council of Frankfort, A.D. 794, the Pope's commands were rejected. The British Church lived during the 200 years of Danish invasion. Edward the Confessor resisted the Pope's claims. William I. and II. protested against the Papal power with natural sternness; Henry I. with intelligence and firmness. In fact, there is no period of our history when the Papal jurisdiction existed as a right. Occasionally some sovereign or prelate, bolder or more learned than his fellows, would resist this usurpation: among these champions we find Robert Groslète, bishop of Lincoln, and John Wickliffe. The *Statute of Praemunire*, A.D. 1393, gave the Church of Rome in this land a fatal blow, from which it never recovered. The victory at Bosworth Field placed the house of Tudor on the British throne, and before that house was displaced, bad as some of its sovereigns were, the Reformation was carried on and completed.

My reply is finished. The reader who ponders the subject will see some of the conclusive evidence which early authentic records afford us of the apostolic origin, the orthodoxy, the vigour, the independence, and we may add the primitive virtual, indeed literal, Protestantism of the church of our forefathers, the church still of the “British Isles.”

J. B.

NEUTRAL ARTICLE.

ANOTHER element can be introduced in the discussion of this subject, which for want of a truer term we may perhaps call Neutral.

Strange it is, that in this discussion the existence of the ancient British Culdee

Church should have been so little alluded to! Let me first, then, give its history, from which afterwards we may derive some views bearing upon the question in debate.

Whoever may have been the first individual promulgators of Christianity in our

live land, the Culdee Church, as the oldest Christian ecclesiastic establishment in the British isles, ranks in precedence above the Pope's Papal Church in this country: and though its remaining records, brief as they are, presents a bold protestation against its usurpations in the name of Peter. It was thus founded. About the year 563, Columba, with twelve of his followers, left his native Ireland, as the Venerable Bede records, "to preach the word of God to the provinces of the Northern Picts." After converting them to the faith of Christ, by his precepts and example, he received from them the island of Iona, for the purpose of founding a religious community, of which he was the first abbot—his companions forming a college of apostles and elders. Thus they received the name of Culdees, from the Gaelic word *cuil*, signifying a cell, the individual apartment in a convent. In Iona they thus lived as a religious community, "having all things in common," like the early disciples at Jerusalem; and in that island, thus hallowed by sacredly ancient associations, was the centre of their operations for the conversion of their forefathers to the gospel. Bede gives a brief account of a mission sent from Iona to Northumbria, under Aidan, a monk or overseer ordained for that purpose. Aidan, he tells us, always had "for its government a presbyter abbot (or patriarch), whose authority both the whole province, and even the bishops themselves, by an universal constitution, ought to be subject, after the example of their first teacher, who was not a bishop but a monk."—"From this island," he adds, "and from this *collegio sanctorum*, was Aidan sent, having received the degree of a bishop." The king, Oswald, he further tells us, "sent to the elders of the Scots, among whom, during his banishment, he had been baptized, that they might send him a bishop, by whose doctrine and ministry the nation of the Angles, which was governed, might be instructed in the Christian faith." Sergenius, then patriarch of Iona, held a council with his elders upon his communication,—“the faces of all that sat there were turned to Aidan;” and “they determined he was worthy of the bishop's office, and thus, making him bishop, they sent him forth to preach.” To this apostolate of Aidan's, the great and venerable establishment of Landisfarne, or Holy Island,

owed its foundation. After his death, Bede further reports, that “Finan, in his stead, received the degree of bishopric, being ordained and sent by the Scots.” The progress of the Culdee Church, however, is involved in much obscurity. The Romanists, when they arrived at power, probably destroyed their records. The chief college of Iona was burnt several times by the Danes and other enemies, and had its martyrs in an abbot and fifteen disciples. Notwithstanding these disasters, northern learning was greatly indebted to its institution. It was for a long period the great European school of theology and science. Its library was famous, and its piety without imputation. Many other were the collegiate establishments which branched from it, although we know but little of their history. Those in Scotland gave to that country its early European reputation for learning. Certainly also, at the time of the Roman Pope Gregory, when Augustin was sent by him to the heathen Saxons of Britain, who were then even the most numerous part of the population, the ministry of the primitive Culdee churches was in full activity. In doctrine, also, the Culdees sided with our illustrious countryman, Pelagius. The Romish party thence, on their introduction to England, attacked them as heretic, gained or bribed the ears of the princes against them, and, assisted by the arm of flesh, seized upon their bishoprics. Hundreds were slaughtered at the Culdee convent of Bangor, under the swords of the Romish Saxons—newly converted, as Rome converts. Several centuries after Augustin, nevertheless, establishments of “the old religion,” as it was well called, still remained in obscure parts of Britain. Giraldus Cambrensis refers by name to the Culdee churches, as existing in his day. Bede further informs us, that the members of their colleges, “according to the example of the venerable fathers,” lived by the labour of their own hands. Lingard informs us, after Bede, that “the little property they enjoyed was common to all.” Thus they were orthodox to the custom of the church at Jerusalem, although heretics to the usurping bishop of Rome. The Romanists attacked them on their time of keeping Easter, and on their mode of tonsure. They also accused them of not instituting the confessional. It may also be inferred from Bede, that the Culdee Church baptized “in any

water they came to," without any ceremonies similar to the Romish rites; and Lanfranc reports also that the Irish Christians baptized infants by immersion, without the use of a chrism. The "real presence," and image-worship, formed also no part of the Culdee creed. The war between Rome and Iona was, therefore, one of life and death. In this Rome came forth the conqueror, through her money, her arms, her skill in intrigue, and, not least, the easy nature of her conversions. Her idolatry was more likely to gain Pagans, than the pure Christianity of the Culdee colleges. Still the old religion of Britain fell not without a sacred struggle. Buchanan informs us, that Boniface, an agent of Rome, upon a visit to Scotland, was opposed openly by two learned Culdees, Clemens and Samson, who told him freely, that he, and those of his party, studied to bring men to the subjection of the Pope and slavery of Rome, withdrawing them from obedience to Christ; that they were corrupters of Christ's doctrine, establishing a sovereignty in the bishop of Rome as the only successor of the apostles, to the exclusion of other bishops; that they used and commanded clerical tonsure; that they forbade marriage to priests, and extolled celibacy;* that they caused prayers to be made for the dead, and erected images in their churches; that they had introduced into the church many tenets, rites, and ceremonies, unknown to the ancient and pure times, yea, contrary to them. For this, Clemens and others suffered martyrdom. Even as late, however, as 1176, Gilbert Murray, a young Scotch clerk, chivalrously asserted the claims of the Culdee Church, in the face of a cardinal legate from Rome. Now, desolate and in ruins, are Iona and its colleges. "The

* It might thus be inferred, that the Culdee convents were not oelibitary, and that their ministers were not monks except in the sense of cœnovices—partakers in a collegiate form of life.

island, which was once the metropolis of learning and piety, has now no school of education, or temple of worship." Yet, "perhaps in the revolutions of the world, Iona may be some time again the instructress of the western regions." In history, at least, though dead she still speaketh.

Having thus sketched her history, let us ask, What does the past existence of the Culdee Church say in proof or disproof of the apostolic origin and national independence of the British Church? It declares to us the fact of an ancient church, existing in these islands, as purely apostolic in principle as possible, and thus utterly at variance with churches claiming to be apostolic, only by successive impositions of hands. It informs us, that that church asserted its independence bravely against Roman usurpation, but evidently also, that it was neither state established nor generally received. It declares to us, that it was subdued by Rome—therefore that the church which in this country had the most ancient claim to apostolic origin, lost its independence, and ceased to be "the British Church." The present state Established Church of England derived its ordination from Rome—not from the Culdee Church. It is a branch, therefore, from the Roman, and not from the British Church. The confusion increases. Let it do so. Inward things are assuredly superior to outward; and an apostolic spirit to an episcopal ordination. I throw, then, this sketch of the Culdee Church, with its purposely crude conclusions, as flax to the flame, satisfied simply to add another element to an important controversy.

[We insert the foregoing article on account of the interesting information which it contains, and from a desire not to restrict our contributors in every instance to affirmative and negative positions—Eds.]

The world would be more happy, if persons gave up more time to an intercourse of friendship. But money engrosses all our deference; and we scarcely enjoy a social hour because we think it unjustly stolen from the great business of our lives.—*Shenstone*.

Thou mayest make thyself more learned by reading, but wiser only by acting; spend not all thy vigour in discipline, in the dressing-room of the soul, but step out into the world, and live as well as think.

Politics.

OUGHT THE JEWS TO BE ADMITTED TO PARLIAMENT?

AFFIRMATIVE ARTICLE.—III.

THIS is a question of two sides, and each thought to possess sufficient plausibility to adapt it for the *British Controversialist*. It is so; but it is, at the same time, an instance of native right obscured, of the very simplicity of plain, unmistakable self-evidence mystified—all thanks to the darkness and cruelty of the past, and the conventionality and world-lug Christianity of the present! But this is not the only interest which has been so acted upon by misconception, mistaken zeal, vicious tendencies, and traditional influence. Distrust, scorn, and malevolence,—these, as the foster children of sordid interests, and the vicious germinations of race-bounded sympathies, have had to do inimically with the varied interests and the temporal relationships of humanity.

Traditional influences and the petty predilections of race do not confine themselves to oral expressions, for they have had the hardihood and energy to manifest themselves in some three or four pages of negative matter in the present discussion, assuming to themselves the formidable appellation of "Veritas." "Veritas" does, indeed, bring before us some vague apprehensions and mysterious hints as to the direful results of a practical recognition of the eligibility of the Jews for parliamentary duties, but that is all. The separation of church and state, which he regards as a consequence, and from which he apprehends so much evil, is anticipated by an increasing number amongst Episcopalians themselves as something very desirable. Again, how the co-operation of the Jews with the legislature can seriously affect the democratic interests of our country, we can scarcely conceive. They might, possibly, prove antagonistic to illiberal, sectarian, and class legislation, and in this we should rejoice. We can scarcely imagine "Veritas" to be extraordinarily grave when he speaks of the probability of national servility ensuing from this concession to the Jews. Imagine England with her attainments, her onward impulses, and her political position,

crouching beneath a nation scattered and feeble! The Anglo-Saxon fire is to pale before the self-invoked faintness of the Israelite life! A nation receptive and reflective of the illuminations of "the Sun of righteousness," left to the mercy of those that court a worse than Egyptian darkness, rather than receive the "true light!" And then think of these results flowing from our yielding to the Jew that which we believe to be his right, and which we cannot, without moral injustice, withhold! The writer, having bent the necks of the "free-born English," should have placed the feet of Salomons or Rothschild upon them, to have completed his caricature of a possibility. We may point out a calamity he appears to have forgotten; not that we have any design of adding to the intensity of his apprehensions, but that his intelligent patriotism may induce him to rouse the country immediately to its danger, for we have the enemy in our camp and in our counsels—Disraeli,—shorn it may be of some of the most obnoxious antecedents of a Jew, yet still sufficiently connected with that nation to be its "friend at court." And if capacities and intentions be exerted so mischievous to our nation as "Veritas" believes to attend the Jew, as a necessary consequence of his religious peculiarities, Berkshire ought quickly to look for some other representative, and London and Greenwich will shrink back—the one into its fogs, the other into its park seclusion—abashed at their infatuation, under the consciousness of which they will doubtless, with yet more profound humility, unconditionally accept the guidance of those "lords spiritual" who, with their compeers of kindred interests, and like sentiments, have shown how they intend to deal with innovation upon *their* constitutional inheritance.

We would now deal with "Veritas" incidentally, as to the remainder of his antagonistic positions.

The Jew is looked upon by many as a stranger and sojourner amongst us; but this

is not so much his own view, for the national relationships most obvious to the Jew are such as connect themselves with his present and personal history. The land of his birth has manifold and every-day associations, vieing in their minutiae and power with that of the Gentile. His interests—commercial, social, and political—are those of the country he inhabits. He is a loyal subject, a peaceful citizen, and, in some cases, is high and active in municipal office. But although he may be everything that a citizen, a subject, and a neighbour should be; and though, by virtue of his merits, he is invested with municipal authority; yet his religious peculiarities cause his repulsion from a theatre of action where questions of sect and creed ought never to be met with.

To dispute the rights of a Jew to a legislative position, of course involves an interference with the rights of a people; and, therefore, if the presence of a Jew in our legislative assemblies be a contravention of the sectarian and accidental phases of our laws, to prohibit such presence is to do despite to the broader, more sacred, and essential principles of our constitution. To withhold legislative rights from the Jew is also an interference with the electoral rights of a general constituency, and a government which does this not only inflicts simple and individual wrong, but violates the rights and dignity of the English people, and performs an act of unconstitutional power.

The Jew is the Christian's compeer and co-equal in regard to all those rights and dignities incident to the organization of government amongst a people. They both are similarly affected by the dependent nature of a national administration, are similarly related to its honours and powers, and their interests being equally involved in its operations, their influence is equally legitimate, and the performance of duties is equally the business of both. Their creeds are at issue, but these relate to their God. Their rights are mutual, identical, and inter-dependent; their social interests are common; the machinery of government is the property of the community, and of every individual of that community.

In considering this question of the Jews' admission into Parliament, there are many who never think of going back to the true principles of civil polity and government,

but they take that compound idea "Jew," and see how it will agree with our church and state constitution; and finding that it will by no means adapt itself, they (if somewhat philosophically disposed) search deeper, and find that the results of its artificial introduction would be the dissolution of the incongruous components in the constitution itself, and they summarily conclude that reason, and wisdom, and religion, are all against the Jew being treated as another man. But are such actually ignorant, or obstinately unmindful, of the truth, that an administration, free of all ecclesiastical elements, mindful of the community, unmindful of the sect, is the only government legitimate, equitable, and impartial, and therefore the only one adapted to man? Cæsar and Cæsar's government have to do with man socially, not religiously; with man politically, not ecclesiastically; with man temporally, not eternally; and with man as related to his fellow-man, not as related to his God. All arguments gathered, then, from ecclesiastical connexions are worth nothing, and it is only such as come from legitimate and logical sources that can at all affect the Jew's right to take part in the counsels of the land of his nativity; and such, we believe, to be entirely wanting. It is his religious peculiarity that precludes the Jew from the legislative department of our government. But the religious peculiarity of the Romanist is quite as obnoxious to our Protestant constitution; that of the practical and intelligent Dissenter is opposed to its ecclesiastical character; and the Infidel is consciously and boastingly antagonistic to all its religious tendencies. The known Infidel, the Dissenter, and the Romanist, occupy their seats, but the Jew is not allowed his. Their positions are similar, but the force of public opinion has obtained liberty for the first three, but tyranny and injustice still do violence to the fourth.

Although the chosen medium of incalculable blessings to the Gentiles, the Jewish people were expatriated, denationalized, and forced to seek a refuge amongst the stranger nations of the earth. It is, therefore, not merely injustice, but injustice of the most abominable and despicable nature, to deny their descendants the common rights of a community. Their national antecedents are a powerful plea for their generous wel-

opportunities of advancement, to of dignity and influence, a to offer. Their long association, sequent identity of their interest hies with the people amongst lwell, constitute their authorita- to all privileges of the nation. s came amongst us as oppressors lera, but we do not deny the ir descendants. The Jews came as peaceful and honourable men, ts of *their* children, as English- s fellow-members of this social have been withheld from genera- ration, and are now most tena- ited.

, solitary slave; Mordecai and ized captives; all of a hated e yet, on the knowledge of their , and on the conviction of their pacities, raised by idolatrous e most important positions of

power and trust. The Jewish religion had always the over-shadowing of a terrible omnipotence about it, which made men fear for themselves and their gods; and their idolatrous faith had nothing to fall back upon against the religious influence of an Israelite prime minister, except apprehension and uncertainty; yet they put all real power, all weighty national interests, into the Israelite's hands. We, conscious of the new-born might of the phoenix Christianity, and intelligent respecting the absolute weakness of the God-forsaken Judaism, do yet make our apprehensions one ground for refusing the Jew a place amongst our national councils; we refuse him on the ground of certain accidents in our constitutional embodiment, the presence of those accidents being palpably an enormous iniquity. We exclude the Jew, although the chosen representative of two of the most important and enlightened constituencies in the kingdom. W. G.

NEGATIVE ARTICLE.—III.

d simply ask "Adelphos," the e affirmative of this question in ry number, whether the sole between an English Jew and

Protestant or Roman Catholic s difference?" If it is so, what s of that separate, yet not sub- ationality, which constitutes the culiar people?" There is incor- h that religious difference a ference also, and it consists in r faith necessitates them to look any country save their own, as for the time being merely, and hich they are in daily expecta- g recalled. They believe, that to which they belong shall yet, now not how soon, be re-estab- r the personal governance of the Their sympathies hover round wever lightly we may esteem

in a religious view, politically it assumes a large measure of for the patriotism of a Jew, land of his adoption must be indeed; this bond of union can r unite him to that country only s ultimate hopes are centred. s of English Protestants are n England; so, too, are those of

Roman Catholics, although they do abcrate slightly towards the pontificate.

We should like to be very brief, and yet we should like to place this question on the broadest basis of which it is susceptible. We submit the following statements towards this end.

1st. The stronger and more numerous the ties which unite a nation and its legislators, the greater probability there is that these legislators will act with fidelity to the people.

2nd. The ties by which men are most closely allied in civil relationship, are common descent, common faith, frequency of intercourse, similarity of interests, and kindredness of feelings and habits.

The Jew, belonging to a distinct race and a different country, professing an adverse faith and avoiding marital alliances, have not—cannot have—that sympathy with the people, that attachment to the country and its customs, which would justify us intrusting him with parliamentary privileges. These are defects which are not surmountable, except by a renunciation of his religion, his habits, and the aspirations natural to a Jew regarding country—terms clearly impossible, and yet terms, his acquiescence in which is essential before senatorial dignities

can be claimed for him as a right, for without such a radical change he cannot stand on the same footing as our own candidates, and it would be displaying an unbecoming partiality for foreigners, as well as be insulting to the genius of our own countrymen, to give the precedence to the Jew, unless there exists an equality on his part, not to speak of a superiority, though one might very properly do so. To counter-balance these defects, the Jew ought to possess qualities outshining those of Englishmen.

The writer already referred to proposes a series of questions ending with the following as an appropriate climax:—Is he (the Jew) eminently notorious for dishonesty in his mercantile and business transactions? “Adelphos” must have laughed to himself while penning this sentence, knowing well that no one feels at ease in dealing with a Jew. We confess great deference to the aphoristic wisdom of the nation which pronounces the Jews to be a people prone to overreach. The specious queries of “Adelphos” are completely answered by asking antithetically, Is the Jew a *better* citizen? Has he been *more* faithful to the trust reposed in him as sheriff, alderman, justice of the peace, &c.? If not, then no superiority has been established; but superiority must be established, else the objections urged

are not overcome—a satisfactory reason has still to be adduced for preferring a Jewish legislator.

“Adelphos” further says, “They (the Jews) would absent themselves from debates on church questions.” If their religious tendencies are likely to have this effect, better retain the disabilities. Englishmen are not wanting who can deliberate on such questions without being under any necessity of shirking their duties. We are not illiberal. Surely it will be conceded that the candidate who can best further public business is the one who should be elected. We would infinitely rather have persons professing the most heterodox opinions to share in our national councils, than admit Jews, and this too not without reason: the former being allied to the country by numerous ties, offer a guarantee that the confidence we repose in them will not be abused; but we must say we fear the malign influence of Jewish wealth.

An important trust is placed in the hands of electors, as they choose representatives, not for themselves only, but for the masses who do not enjoy the franchise privilege; it therefore becomes them to employ that trust warily, that they may not compromise the national interests by the choice of Jewish members.

ARISTIDES.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—III.

ACCEPTING U. M.'s definition of Communism, viz., that it is “that principle which would render common property to the entire human family the earth and all things which from time to time are produced from it, whether they be animal, vegetable, or mineral, and which would, at the same time, render the production of them common,” we purpose in this article pointing out the injustice, impolicy, and immorality of that principle, and consequently its utter incapability to promote the happiness of the human family; and, in conclusion, briefly to glance at the respective articles of U. M. and L. I.

in support of the affirmative side of this interesting question.

We are first to show the injustice of the Communistic principle, which would make all animate as well as inanimate matter common property—the productions of all the property (consequently) of all.

No two men are constituted alike; with the powers of mind or body, with like energies of disposition, with the like capabilities in producing property—the effect of labour. The capabilities, and the labour, are the individual's; consequently their produce—property—should be the individual's also.

The cause is the individual's, the effect is the individual's. Upon this principle society from its very commencement has acted; this principle is sound in theory and sound in practice.

Our ears tingle with the sudden "Hold hard!" of our opponents. "We deny the soundness of the principle. The labour, say we, should be the community's; consequently the property should be the community's also." Indeed it is time for us to draw tight the reins of our onward-speeding senses; for we perceive that at this early stage of our journey lies the object we are pursuing—the chief point at issue between us, viz.—Whose property should an individual's labour be, his own or the community's?

Suppose an individual to be wrecked on an island uninhabited by man. Fortunately for him he has been able to save from the wreck a few grains of corn and an implement or two of husbandry. He tills the soil, sows his corn, and in due time reaps the harvest; living, in the meantime, upon such animal and vegetable products as he has been able to discover. He labours himself, for himself, and the product of his labour—property—is his own. After a time, a party of individuals are wrecked upon the same island. Would it be just or right for them to take possession of the plot of land cultivated by the first comer, and make it and its products common property? Would their arrival make the labour of the primary occupant any the less his own property? Not at all. The cultivated plot should remain inviolate the property of the first occupant, who had expended labour upon it; and the new arrivals should go forth and subdue the land in like manner, receiving that kindly assistance from the former which his religion and his nature would prompt him to give.

No one, we think, will deny the soundness of the principle here laid down.

Time speeds on, and the patriarch of the island is on his death-bed. But not alone. A manly youth, his eyes moist with tears, hangs over him. He is the fruit of the dying man's marriage with one of the second comers. The love of the old man beams forth from eyes soon to be closed in death; and a smile playing round his mouth betrays an inward contentment and happiness. He dies; and his weeping son stands

the possessor of that land, extended and improved, on which the old man had spent so much weary labour. A cottage, furnished, rudely indeed, is his also, likewise the effect of his father's labour. Will any of our opponents question the right of the son to this property? Can they argue that it should have devolved upon the community? Who had so good a right to it as the father's own son? Would the old man equally have delighted as much in planting those hedges, in building that cottage, in manufacturing those chairs, those tables, those platters, those drinking vessels, had he known that they would, on his death, have become the property of the community? We venture to answer, No! We venture to assert that it was a father's love that stimulated him to labour so energetically, and with such effect. Who shall dare assert that the happiness of his death-bed was not one of the rewards of his toil! Who shall say that the smile-educing agent was not the knowledge that his labour had not been in vain, for it had blessed his son whom he loved! Whose blood does not boil at the thought of a stranger's shadow hereafter darkening the doorway of that cottage, of a stranger feeding at that board off the fat of that land? And is this feeling the result simply of education? Surely not! Surely it is the result of a principle implanted in our nature; for have we not found that from the very beginning it has been so—from the very first the child has stood in its parent's shoes?

And has not this hypothetical case a parallel in reality? Is it not an example of the manner in which the soil of the earth has become the property of individuals? Yes! Occupancy gave the original right to all landed property.

We hold, then, that we have established the justice of the claim to the soil by occupancy, and to other property by inheritance; and therefore any principle, as that of Communism, which denies this right, is unjust in its effects.

We have said above that men are not constituted alike, that they do not possess equal capabilities of producing property. A. can produce such a property in ten hours as would take B. fifteen hours to produce, and yet in a society of Communists B. would be as well off as A. "Very good," answer

our opponents; "if A. possesses better capabilities than B., inasmuch as his capabilities belong to society (for, as the productions of his capabilities belong to society, so his capabilities—that is, their use—must belong to society also), so he ought to exert them to the utmost for society's benefit, in the same manner that B. exerts his as far as he is able, and yet receive only the same amount of compensation." For the sake of argument, granted. But what guarantee have you that B.'s lesser capabilities are not the result of idleness whilst learning his business, or of wilfully working in a wrong manner? Or, how know you that he does not really possess equal capabilities with A., only he is too idle to exert them? Such may be, and such undoubtedly but too often would be, a result of the Communistic principle. A., a clever and industrious man, would receive no greater remuneration for his services than B., a stupid and idle man. This our opponents must admit to be an evil, and a great injustice.

But this brings us to our next point, viz., that the Communistic principle is impolitic. This, we think, can be easily shown. It would prove a barrier to all progression, by removing that great incentive to exertion, the accumulation of property. Had not the old man of the island a right to the land he had cultivated, to the cottage he had built, and to the furniture he had made, we believe he would have cared but little to have laboured so diligently upon them. And had not society in general the same stimulus to exertion, we believe it likewise would care but little to produce anything beyond what was necessary to its immediate wants. We believe that in time society would become little more than a food, clothes, and shelter producing community; with no knowledge of science, and with no works of high art. How has the knowledge we possess of chemistry been, for the most part, acquired? By hard, close, life-devoted, non-self-supporting labour in the laboratory: and the seeker may have been rewarded by the discovery of one truth of practical benefit in a life-time. Would the community consent to support the alchemist, whose labour is of such a non-producing quality? We trow not. How, again, would it be with the astronomer, the traveller, the mechanist—*would society support them a life-time, in*

return for *the chance* of the discovery of a new planet, of a new land, of a new piece of machinery? Again our answer is, we believe not. There is no *certain return* to labours of this nature, at the same time that their pursuit costs not only labour but money and material too.

Again, as Communism compels an equality of education, would it be found that A. B. C. and D. would consent to labour, respectively, in the field, in the mine, in the dockyard, in the manufactory, whilst E. F. G. and H. laboured respectively in the office, in the studio, on the bench, in the parliament house? We think not. We believe that Communism would lead to endless heart-burnings and discontent. It would engender the feeling that I, A. B., perform labour costing much more exertion than that of C. D., and yet I am no better off. If these things be true, the impolicy of the Communistic principle is evident.

Of its immorality we will say but little; indeed it is a point upon which we dare hardly venture.

Carry out the principles of Communism to their natural and legitimate ends, and they necessitate a total overthrow of the present existing relations of man to woman. Communism would make woman common property; all children would then be common property also. This, horrible as it may be to contemplate, is but the natural effect of Communism. Let woman, as now, be the property of one man, and the offspring, during its minority at least, is their joint property, to educate to fill any station in society they may please. And should it not be so? Or should the community have the power of stepping in between the child and its parent: of saying, "thus and thus shalt thou bring it up; these religious, these social, these moral principles shalt thou instil into it?" Or worse still, should the community, with ruthless hand, crying aloud, "My property! my property!" have the power of snatching the sleeping infant from its mother's breast, or from its father's knee? Should the community have the power of thus rudely severing all those fond ties with which nature has bound together the child and its parents? Would it be better that the community should soothe the bed and close the eyes of its departing members? Or would a loving child perform the office

less tenderly? But the child knows not its parent; 'tis the community's property, the community's offspring!

Upon this point we will dwell no longer, readily believing that our friends U. M. and L. I. never for one moment contemplated the terrible idea (too horrible to be spoken of without a shudder) of woman and woman's offspring becoming common property.

We have endeavoured to show that Communism is unjust, impolitic, and immoral in its tendencies: whether we have succeeded or not, our readers will be able to judge; but if we have, it requires no argument to demonstrate that a principle which tends to so much evil cannot promote the happiness of man.

With a brief glance at the respective articles of U. M. and L. I., we will close this already, we fear, too lengthy article.

U. M. lays down three propositions, which he endeavours to substantiate. The first is, "That the earth and all that is produced from it by the labour of man, ought to be common property." In support of this he argues that God made the earth for the use of man; made it possessed of "an intrinsic value," as it contains "the elements of wealth," and as that value was given to it by God for the use of man in general, no individual can have an exclusive claim to it. In answer we say, that the inherent wealth of the soil is made available by labour. Hence the labourer causes the soil to bring

forth its treasure, and consequently that treasure should become his property, to demand a consideration, in the shape of rent, from the next occupant, for the improvement he has effected in it.

His second proposition is, "That every able-bodied man ought to perform his share of labour." Freely admitting the soundness of this principle, we humbly submit that we have already shown that this object is not obtained by Communism.

His last proposition, viz., "That a community of labour and its results would be for the happiness of mankind in general," is in fact the whole question at issue between us; and therefore we apprehend that it requires, in this place, no special answer, as its refutation has been the aim of the whole of this article.

The chief point of L. I.'s argument is that a body of Communists—the Moravians—have been able to effect a great deal of good. Whether this result can fairly be attributed to the working of the Communistic principle or not, we have not time to go into. But, we beg to remark, that the results of Communism applied to a small body of men, united in principle and object, and the result of the principle applied to society at large, would be by no means necessarily the same.

We have then, for the reasons above advanced, come to the conclusion that Communism would *not* promote the happiness of man.

F. F.

AFFIRMATIVE ARTICLE.—III.

In order satisfactorily to answer this question, it will be necessary briefly to inquire, firstly, what Communism and its professed object is; secondly, what the evils are which it proposes to remedy; and, thirdly, if by its practical adoption the happiness of man would be promoted.

1st. Communism is that principle which seeks to restore the primal rights of mankind, by abrogating all claims to the possession of private property; and to secure the equal rights of all men to develop their unequal faculties, by establishing a community of goods and a concerted combination of effort amongst all classes of society. Communism being a principle of union and equality, its object consequently is to overthrow the despotic tyranny of monopoly, and,

by uniting opposing interests, to succeed in breaking down the barriers of *caste*, and in eradicating that spirit of sly distrust which now reigns paramount in society; and thus, by promoting free intercourse amongst all men, pioneer the way for the realization of that pure and loveable Christianity which it was the glorious mission of Christ to teach.

2nd. In order to elucidate our next proposition, we must briefly glance at the present condition and aspects of society.

The present age has been not inappropriately called the "buccaneer stage of labour and civilization." For are not all classes arrayed against each other by dint of opposing interests? Is not commerce, as at present conducted, a trick—a mere species of gambling? Is not wealth becoming gradually

monopolized in the hands of the favoured few, and the gulf between the richer and poorer classes every day widening? Is it not a fact, that while, by increased mechanical inventions, the power of production being thereby indefinitely increased, the labourer has gradually sunk in the scale of social degradation; and, instead of having leisure to cultivate his intellectual, moral, and religious capacities, he is engaged "in a round of toil, sleep, and animal relaxation, which presents (indeed admits of) no gleams of high and holy thought?" Again: "In Great Britain there are 70,000 persons who possess among them an annual revenue of £200,000,000, or about £2,800 a year each; on the average, our paupers, criminals, and vagrants, number 2,000,000; and 17,000,000 depend on wages; while of these there are annually about 100,000 mechanics and labourers out of employ. In the presence of a tremendous growth of evils like these, is not our position most ominous?"* To what cause may be attributed the existence of the above evils, other than to the *private property system*, which, by giving birth to a grasping spirit of selfishness, not only deprives thousands of their just rights, but threatens to undermine the social fabric? Let our opponents answer.

Keeping the preceding *facts* in view, how absurd does the following statement, from the pen of J. N., appear:—"Be it our task to show that the realization of these (Communist) principles in practice would plunge us into difficulties tenfold more harassing (?) than the evils complained of in our present state." Whether he has duly performed his *task* the intelligent reader will decide.

In making the preceding observations, we would not be understood as sounding the tocsin of alarm, by proclaiming the "decadence of England," but as simply endeavouring to show the necessity of a great social change; for we believe that the evils enumerated are to be traced rather to the operation of causes *none* of which indicate national decline; hence we conclude, in the words of an able writer in the *Edinburgh Review*, "that the world can never have been intended to be, and will not long remain, what it is."

3rd. Having shown the evils which Com-

munist proposes to remedy, we will now show how, by its practical adoption, the happiness of man would be promoted.

Its fundamental principle being that all property, all talent, all strength, all learning, all labour, is but a trust from God, to be applied for the benefit of all, it follows that the energies of all in a Communistic state would be directed and employed, not to administer to an exclusive spirit of selfishness—not to crush the weak and favour the strong—but in drawing out the kindly sympathies of human nature, by furnishing the means of physical, intellectual, and moral development, and thus promoting the happiness of man.

But, says C. W., Jun., this is "too visionary to be productive of really beneficial results." What! "can men unite to erect bridges, to construct railroads—ay, and to destroy one another in war—and yet not coalesce to make one another happy? Then, indeed, is the history of human progression well nigh closed, and the regeneration of man a vain hope!" One thing, however, is certain, that Christianity in connexion with *competition* can be but a meaningless word, the import of which can only be fully realized in that state of society where unity of interest binds man to man in the silver bond of universal brotherhood; and yet this is that state at which the "sympathies" of J. N. "revolt." Communism, in seeking to infuse a spirit of vital warmth and christian energy into the present cold, selfish, and gold-worshipping system, is by C. W. pronounced "visionary;" and J. N. has "no faith in its practicability." But, however "visionary" the Communistic principle may *appear*, by that eternal law of progress which will at last rectify every wrong, and vindicate the equal rights of men, the social dependence of one man upon another must cease, as befits the brethren of one family whose origin and destiny are the same.

Having shown that Communism would promote the happiness of man, we will now present our readers with an extract from the writings of Mr. James Silk Buckingham, to show that it is capable of being *practically realized*. After spending a day in visiting the Rappite Community, in America, in the year 1839, he says:—"Our last thought, on closing the day, was as to the contrast of happiness and virtue which this community of 500 persons presented, when compared with

* "The Age and its Architects," by E. P. Hood, p. 76;—a work to which the writer is indebted for much valuable information in relation to the present condition of society.

any other community, of the same number and extent, in any part of the world; and my conviction was, that there was nothing impracticable to prevent the formation of similar communities."

We will now endeavour to cope with one or two of the principal objections urged by J. N. He says, "Whatever social form we adopt, we must accept human nature as it is." True; but *human nature* is one thing, and its *manifestations* are another: in the one case it is ever *the same*; whilst in the other, chameleon-like, it is ever and anon assuming new aspects, the result of subjective influences, for "men are as much influenced and controlled by the social system in which they live, as a raft is by the current in which it floats."* Hence the importance of surrounding *human nature* with good social influences. He also says that "the upholders of Communism take a too favourable view of human nature." We thank him for the compliment. He also urges that, "reason as we may, from infancy to age, man clearly manifests his attachment to private property."

* G. Combe's "Moral Philosophy."

Query, Does a mere "attachment" confer a claim of possession? He also asks, "If that motive (fear) to action be withdrawn, what shall secure us against a relapse into barbarism?" We answer, that motive which induces to activity in one degree of development is inoperative in that of another. Hence, in proportion to the progressive development of human nature, so will it be influenced by higher motives to activity, until "*conscience or reflection*," to quote Butler, assume "that absolute authority which is due to it." So that a "relapse into barbarism" may be said to be impossible. In relation to the "unworkableness" of Communism, mentioned by J. N., we believe that as practice develops the advantages of the system, and exposes its weak points, the former will become increased, the latter remedied, until the principle has been carried to the greatest extent to which it can subserve human happiness.

We have now followed J. N. through his principal arguments, and not wishing to exhaust the patience of the reader, we make our bow and retire.

HOMO.

The Societies' Section.

ADVICE TO STUDENTS.

SEEK to attain the power of mastering the mind, for this is the foundation of all mental discipline. This mental exercise is the groundwork of character. He who enters upon it seriously, under a sense of its supreme importance—who trains himself to habits of close and strictly voluntary thinking—who holds a stern control over the subjects to which his thoughts are habitually directed, guiding them to the worthy, and putting away the frivolous, the degrading, and the impure,—that man among you will attain to eminence, for he is pursuing with all his might the highest of all earthly interests—the culture of the ennobling faculties of mind, and the discipline of the heart. Gather knowledge by every means in your power, and seek it in every path. Knowledge is obtained by observation: cultivate, then, the power of attention. Let nothing escape you unobserved; be all ear, all eye, all grasp. Knowledge is obtained by reading: but read wisely and well; make choice only of the best of books, read few, but all that are necessary, and make their contents your own. Knowledge is obtained by thinking: combine facts, so as to deduce principles from them; invigorate your minds by independent contemplation and reflection; learn to form sound opinions for yourselves, and train your minds to that proper self-reliance which stamps strength and character on thought. Knowledge is obtained by

experimenting: much of the instruction which you will receive from lectures and from authors, you can only rightly appreciate through personal experimentation. Knowledge is acquired by conversation: learn to converse wisely; glean in conversation the knowledge which springs from the observation, reading, and reflection of other people, and strengthen the hold of your own information by imparting it to others. Knowledge is acquired by recording: keep your knowledge from perishing; make it infallibly correct by recording your facts and thoughts. Knowledge is acquired by the practice of composition: learn early to fix, regulate, and multiply your ideas, by writing; increase the retentive power of your minds, and acquire perspicuity and correctness by this exercise; arrange all your professional knowledge in manuscript, so that you may know exactly the amount of your store, and the more easily weed out your errors. You will get knowledge in vain unless you combine facts so as to draw from them general principles. Cultivate good principles as long as you live; be never weary of the pleasures of science. Beware of the approach of that sore delusion—that you have done enough. “*Nil actum reputans, si quid superesset agendum.*” Profit by the ancient proverb—“*Sui cuique mores conciliant fortunam;*” “manners make the man;” and wipe away every fault in your demeanour. Acquire right principles, generous sentiments, and an uncompromising adherence to truth; and by good examples acquire the essential rules of good breeding—“in honour preferring one another.” Adopt the feelings and bearing of gentlemen; and, as good manners are better taught by example than by precept, associate with those distinguished by elevation of mind, sound principle, and good behaviour. Acquire a ready sense of the *quod decet* and *decorum est*, and indulge in no unseemly peculiarity. The student for whom I have the most hope, who, in my opinion, will attain honourable distinction in his profession, is the youth who enjoys a satisfaction altogether independent of immediate reward or of prospective advantage, in passing through the arduous paths of science; who possesses that sound and healthy condition of the mental faculties which enables him to take for his motto—“*Labor ipse voluptas.*”—*Extract from a Lecture by Dr. Watts, of Manchester.*

ON LEARNING LANGUAGE.

IN studying language, it is important to remember that words are but the outward expression of what passes in the mind; and though the things which the mind can busy itself about are innumerable, the ways in which it can deal with them and put them forth in speech are few and limited. Language, in fact, may be compared to a wood with innumerable trees, but one well-trodden broad path through it, which in ninety-nine cases out of a hundred will lead the traveller right; there are also bye-paths leading to particular spots, and the pathless wood with plenty of scope for wandering and being lost. Suppose, then, a stranger brought into this wood, and desiring to pass through it. The only sensible advice that could be given him would be, “Keep to the main road, beware of the thickets, avoid entangling yourself in bye-paths or short cuts, till you are thoroughly acquainted with the general features and bearing of the country.” Can any way, then, of teaching language be right, which is not analogous to this? Ought not all the curiosities and exceptions to be passed over unexplained, until the common every-day framework of

ordinary sentences, the beaten path that is, be well known? It will be time enough then to explain and point out the apparent deviations and inconsistencies. But this is the exact contrary of the method usually pursued. The mind of the unhappy learner is stuffed with all manner of exceptions long before he clearly knows what they are exceptions to; and with idioms countless, long before he is aware what is the general type from which they seem to depart. His bewildered brain is set floating amongst numbers of isolated cases, and unconnected facts; there is only one omission, unfortunately rather an important one, no chart or compass is given him for his guidance.

Let every teacher (who knows such things himself) boldly resolve to notice nothing till his pupils are thoroughly acquainted with the common principles of all language. There will be less show for a time, but more safety. Men with a certain reputation as scholars not unfrequently cannot give the principle of the simplest step in their parrot-like knowledge. How often, for instance, it is said, he is a very clever man himself, but he cannot teach others. In plain English, he has never been taught the principles of his knowledge, he has not thought them out for himself. The result is obtained by unceasing practice, and as that is incommunicable, others cannot benefit by it. Blind men can *feel* their way along familiar paths, but are unable to give directions to others' sight.

Now the study of language may be looked at in two points of view; first, what language itself is; and, secondly, how we ourselves should behave with respect to it. The one being as it were the road to be travelled—the other, directions for travelling on it well. A few observations on this second point will not be out of place here. First, then, let no teacher or learner pass beyond a technical or general term, such as *subject*, &c., until it has become his own natural way of expressing the thing signified by it. It would be no more absurd to have daily lessons about the *Ornithorynchus*, those engaged in such lessons being totally ignorant of the sort of animal meant, than it is to use such terms as *subject* daily, with a similar ignorance. Very often a careful examination would detect some foolish after-mistake, or even habitual mental confusion, as having arisen from the practice of using technical and general terms without realizing their full meaning. No time is misspent which clears the general terms and first steps. Probably, few National school classes would thoroughly master those two terms, Subject and Predicate, without at least a month's careful training. To give such training without being wearisome is in itself an art. My own method was, when the short reading lesson was ended, to select an easy sentence to be written down by one of the boys on the black board; then the writing and spelling was criticised by the class; after that, the subject and predicate of that sentence were required, with the reasons for the answers; then we left it, and proceeded to build up the sentence on which we were regularly engaged. Every lesson having *one special point as its main object*; this one point, with the summing up at intervals the chain of argument, and recapitulating day by day the former links, being quite sufficient to occupy the whole time, and as much as could be done with profit to a class; the first maxim of good schooling being, not to sacrifice the good of the many to the quickness of a few.

Having cleared the terms made use of, the next great aid in difficulties will be to observe the principle on which the words of *every* sentence are *arranged*. Now in *every* sentence without fail this is certain, that the words which will most *clearly* and *forcibly* introduce to notice what the speaker wishes to make known, *will come first*; and the rest follow, according to its relative importance. It is *probable*, therefore, in any sentence that the

subject stands first; because what the speech is to be about must generally be mentioned first for *clearness*' sake; and without *clearness* nothing can be *forcible*. Viewed separately, the predicate, or what is intended to be said, is generally the principal notion; and, therefore, if *force* alone were the question, to put the predicate first would generally be the most *forcible*. But care must be taken, lest the apparent gain in *force* of this arrangement be more than counterbalanced by the loss of *clearness*. This brings out the value of *formal cases*. When a language has *formal cases*, it gains the power of varying the arrangement of a sentence almost infinitely, without confusion, according to the relative importance of the thoughts to be expressed. Thus in the sentence, "Cæsar killed Pompeius," if the notion required to be expressed most strongly was, that it was *Pompeius* who was killed, a Latin boldly put it first:—

Pompeium Cæsar interfecit,
Pompey Cæsar killed;

and no confusion ensues. In English this can seldom be, unless the predicate consists of the verb of existence, and an adjective; as, "*Great is Diana of the Ephesians*;" where any one can see the increase of force resulting from the position of the predicate. The English language, however, has a plan for getting the predicate first in some instances. The words "*It*," and "*There*," at the beginning of sentences, are often *false subjects*, mere subterfuges for getting the predicate first in the arrangement. Thus—

Subject.

"It is a good thing—to save a man," equalling, "To save, &c., is."

Subject.

"There is no hope—that he will do it," equalling, "*His* doing it is hopeless."

Therefore the words "*It*," and "*There*," are as it were sign-posts, pointing out that the predicate follows immediately, whilst the subject comes last. In English, then, if the first word is *It*, or *There*, or an adjective with the verb of existence, the predicate is generally first in the arrangement, and the subject last. It is obvious that when pronouns occur, as they have formal cases, there is much more liberty of arrangement, as no confusion can ensue. Any dependent noun, however, can be put first as the subject, by casting the sentence into a passive shape; as, "Pompey was killed by Cæsar." This is a common way in English of getting the emphatic word first.

Again, in examining a sentence, if there is any difficulty, whatever conjecture on the point appears most probable, it can be tested in the following manner. Let the learner instead of the word or words which are difficult, substitute others easier, which certainly are, what he conjectures the expression he doubts about to be. Thus, in the sentence "*Will he come fast?*" say he thinks "*fast*" an adverb, but is in doubt; let him substitute an unmistakeable adverb; for instance, "*quickly*:" if that which is substituted exactly fills the grammatical place of the original expression, the conjecture is probably right; if it does not, it must be wrong.

Again, there is a difficult sentence to be mastered; how many let their minds float about at random over it; and unless they find it out by some sudden flash, do nothing. Instead of this, let the learner seize at once on some point he is certain, or nearly certain, about, say the subject, or the principal verb of the predicate; and try whether the rest agree

with this, and makes sense. It is very seldom, indeed, that both subject and predicate are difficult to unravel in the same sentence. At all events, let him examine whether there is more than *one* word that can be a predicate, or more than *one* word that can be a subject; let him decide as to which shall be his certainty; say the subject is, then what verb can possibly form the predicate? Is it transitive? If so, where is the case? Is the case qualified? and so on; adding, by degrees, the rest till all coheres. This, then, is a rule. Let all uncertainties be tried as to their agreement with some certainty. If there is no certainty, let the most probable guess be assumed as certain for the experiment.

Again, it is a great thing to know what the difficulty really is, and where. When this is found, let all words, or clauses, be put out of sight for the time, excepting the word, or combination, that is puzzling. This often clears the matter. As an assistance in doing this, let it be borne in mind, that whenever a relative occurs, it is certain that the clause, in which the relative is, is a complete sentence in itself, as far as grammatical construction goes; and therefore will not influence grammatically any other part of the sentence. In any difficulty then, that clause may be set apart, and shut out from the rest, and examined separately.

Very often the difficulty arises from some part of a sentence not being before the eye, but understood. Let every clause therefore, when this is the case, be written out with its full complement of words. This often clears the matter.

Again, much ignorance arises from rules being allowed to lie about in the mind as mere dry statements. This should never be permitted. Let the learner always frame *for himself* an actual speech or formula, the easiest possible, which is an *example* of the rule, to try his doubtful cases by. Thus, if the rule is: Every pure supposition will have both clauses subjunctive with past tenses of the auxiliary verbs, or verb of existence, let him give it life by having a model supposition to refer to; as, "*If I were foolish, I should learn the rules like a parrot.*" Or if a question is asked on any point, let him at once make a sentence which represents the required instance, and examine that; this plan will marvellously tend to the producing an answer. Thus, say the question is asked: "Explain the arrangement of a sentence which begins with the word *There*." Let him at once write down such a sentence, and examine it; and so on.

Let, therefore, all uncertainties be tested by some certainty, real or assumed.

Let the difficulty be hunted out, and everything else put aside till that is cleared.

Let the suppressed words of a sentence, if needful, be filled in.

Let all rules have reality given them by being embodied in the form of single examples.

Never let technical, or general terms, be passed over until they are completely understood.

Never let the mind float about at random; but let it be fixed at once on some *one thing* to start with.

These rules, regularly acted on, will carry the learner through most labyrinths securely.

—*Rev. Edward Thring, M.A.*

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Spalding.—Young Men's Mutual Improvement Society.—The members of this useful and valuable institution celebrated their seventh anniversary by a public soiree in the Town Hall, on Friday evening, January 9th. There was a very large attendance, the hall being crowded in every part. The orchestra was occupied by several professional and amateur instrumentalists, whose performances contributed much to the cheerfulness of the meeting. After tea the chair was taken by Mr. George F. Barrell, the president, who gave a slight sketch of the early history of the society, and stated that the first two annual meetings were held in private houses, and that the total expense of the first one was only 3s. 6d. He referred to the fact that each individual was the centre of a circle of social influence that was most powerful in influencing the minds and hearts of his friends. Man was essentially a social being; and therefore, intuitively seeking friendship, he was adapted for the interchange of sentiment by his various faculties; but, as the common intercourse of every-day life was not fitted to be the medium of all kinds of conversation, various means had been adopted to supply this defect. In the earlier ages of the world there were the "wise men," who were consulted upon every occasion, and whose extensive knowledge was, in those dark ages, looked upon as supernatural; as society advanced, books partially supplied the place of the wise men; but it was not until the invention of that triumph of man's ingenuity—the press—that their influence became sensible, and when, as if to invest the mighty machine with double importance, the Bible blessed it in being the first book printed. As society progressed, so the means became inadequate to the end, when, as a bright sun to illuminate the world, the newspaper arose to dispel the mist of exclusiveness, and, by its powers of discussion and criticism, to confine to its proper sphere the arrogance of authorship, and show to the people not only one, but many views of the same thing; but in these days newspapers had been found insufficient to supply the growing demand for information, and to quench the burning thirst for knowledge. Other means had therefore been added in clubs, athenæums, mechanics' institutions, and last, but we hope not least, mutual improvement societies; and on behalf of the one whose anniversary they had met to celebrate, he made an earnest appeal. Addresses were afterwards delivered by Messrs. Foster, George, Brown, Walden, Pepper, Locke, Johnson, South, Woods, &c. It is worthy of notice that all the speakers were members of the society, and all under twenty-four years of age. This fact does the society great credit, for, so far as we can judge from the report which has reached us, all the addresses were excellent. We subjoin as a specimen an outline of that given by Mr. George:—At the time Athens was at the highest point of her power—her walls unbroken, her glory untarnished—when her citizens were honest, truthful lovers of freedom—they were remarkable for one particular trait of character, viz., their love of knowledge. Men from all parts of the world might be found at Athens, mingling and associating with their wise men, seeking after know-

ledge. Since that time eighteen hundred years had rolled away, and a mighty change had come over the world—a change which had pulled down from the highest point of prosperity and power nations which were once the glory and the terror of the world; while, on the other hand, it had raised up other countries from darkness and ignorance, and caused them to shine forth most gloriously. But, not only had this spirit of change affected material things, crumbling to dust as well the walls of palaces as the poor man's cot, but it had led men to entertain fresh thoughts, hold new ideas, and see things in a fresh light, so that they who lived in the present day had found that many things which were esteemed by the ancients as the highest wisdom, had proved to be but real folly, while, on the other hand, many of those theories which they rejected with disdain, treating them as wild chimeras of heated imaginations, had proved to be great and glorious truths; yet, notwithstanding all this change, the same love of knowledge—or curiosity, if he might so call it—might be found in the men of the nineteenth century, as distinguished those of early times. But what he wished to draw their attention to was—the advantage of a steady, determined progression. If they wished to know what progression could do, let them go into the forest, survey the giant oak, and reflect that there was a time when any little boy could have snapped that oak asunder—when any schoolboy, with his knife, could have cut it in twain; or go across the Atlantic, to New York, and remember that that city, now the dwelling-place of hundreds of thousands, was but a little while ago no city at all. They need not cross the sea for illustrations—England was the noblest monument of progression in the world. There was a time when her flag was not unfurled on every sea—when, instead of being the first, she was the last of the nations. Let those who were ever dreaming of the past—who looked with disdain upon all present things—who would wish to bring back that "golden age," encompass themselves on every side with darkness, ignorance, and superstition, bring back the time of tyranny and despotism, fill their hearts with fears on account of wars and internal discord, and then they would have a picture of the "good old times;" but as for them, in the name of young men he answered they would not spend their time in dreaming of the past, but would live in the present, and prepare for the future, and a glorious future was before them. Never was there a generation whose privileges had been so great. A period there was when only the rich and the noble of the land could have wise men to teach them; but, thanks be to God, they had a glorious band of tutors—the great and noble of every land, philosophers of every age, statesmen of every clime, poets of every tongue. He exhorted them to be up and doing—to be determined to progress, whatever difficulties might stand in their way. If they learnt but a little every day, they would soon have a goodly stock.

Walthamstow Mutual Improvement Society.—This society was established in January, 1851, for the purpose of assisting all who were desirous

of becoming members in intellectual and mental culture; and in improving them in general branches of literature. We resolved to hold meetings every Monday evening during the winter season; at which meetings essays were read, and lectures delivered, by some of the members; and, upon the whole, our proceedings were conducted in a very orderly and creditable manner. A few of the subjects chosen were as follow:— "Astronomy;" "The Importance of Mental Culture;" "The Steam Engine;" "A Lecture on Music, with characteristic illustrations;" "The Lives and Character of the Apostles," and on "Education." We discontinued our meetings in May, with the intention of renewing them in September, which was effected on the first of that month, when the society was reorganized, and founded on a surer basis. A committee and other necessary officers were elected, and a code of rules, principally selected from those published in your pages, was agreed upon for the regulation of our transactions. Debates were introduced, and essays and lectures continued to be read and delivered on various subjects; all our proceedings being totally unsectarian. "Freedom of thought and expression" is our motto.

On Monday evening, January 27, 1852, we held our first annual meeting; which was, on the whole, very satisfactory and cheering. The enjoyments of the evening were considerably enhanced by the introduction of tea and coffee, of which about thirty-five persons partook; after which several of the members addressed the meeting on subjects suitable for the occasion. May this example act as an incentive to young men in other localities to "go and do likewise," and they will find that, though they be few in number, their labours cannot fail to be productive of results beneficial to themselves and to others. We have at present about thirty-two members.—J. W.

St. Mary Cray, Kent.—*Christian Association and Young Men's Mutual Improvement Society.*—This society was formed on the 9th of December, 1851, by a few earnest, right-minded individuals, who had at heart the attainment of knowledge, that they might be the better able to aid in the dispersion of ignorance, error, and crime, and the diffusion of light and happiness. After three or four weeks were spent in arranging to work the society, Mr. J. S. Featherstone, superintendent of the Educational Institute, was requested to give an opening address; which request he complied with, taking for his subject, "Self-Education, its Helps and its Hindrances;" at the close of this address ten more young men gave in their names, desiring to become members. Our rules differ very little from those given in Vol. 10 of the *British Controversialist*; where you adopt the penny-a-week system, we have taken the voluntary principle, and believe it will prove satisfactory to the members, and advantageous to the society.—J. H.

Blackburn.—*James-Street Young Men's Mutual Improvement Society.*—The motto, "Union is strength," has been well illustrated in connexion with this society. For some years past, efforts have been made to establish a "Young Men's Society." This object was partially attained by the formation of two week evening classes, in connexion with the select classes in

the sabbath school, and conducted chiefly by their respective teachers.

These two classes have, however, been merged into one, and received the above designation. Thus from small beginnings has arisen a society definite and substantial in its constitution, and flourishing in its condition; and we believe that, by wisely-directed efforts, it will prove a blessing to the town at large. With a view of bringing this society into greater notice, its members, with their friends, held their first annual tea-meeting in the schoolroom of James-street Chapel, on Saturday evening, February 7th. The room was beautifully decorated with evergreens, interspersed with flowers.

The Rev. Edward Jukes, president of the society, was in the chair. Several excellent speeches and recitations were delivered by various members. A selection of suitable songs, &c., was given with great effect by Miss Lewis and Miss Bulcock, Messrs. H. Grime, W. Riley, R. Sanderson, J. Bullon, and J. Wallacey (members of the Blackburn Choral Society). "Woodman, spare that tree!" sung by Mr. Sanderson, and "Home, sweet Home," sung by Miss Lewis, were much applauded. The meeting altogether was of a pleasant and instructive character, and all present appeared much pleased with the whole proceedings.—L.M.

Glasgow Literary Institute.—The annual festival of the Glasgow Literary Institute was held in Messrs. M'Lauchlan's rooms, on Tuesday evening, 10th of February, when a large company assembled to do honour to the occasion. Mr. E. W. Henry, the founder of the society, occupied the chair. After tea, the chairman gave an eloquent opening address, in which he ably combated the idea that such societies give rise to a merely superficial knowledge, which is dangerous in its tendencies, or that they induce a partiality for discussions of a whimsical or absurd nature; and urged upon young men the importance of cultivating their whole mental faculties, and the degree to which literary and debating societies might be made subservient to such an end. Mr. Robert Bryson followed, on "The Merits and Advantages of cultivating a Taste for Reading;" Mr. Hurst on "The Cultivation of the Moral Feelings, in union with the Intellectual;" Mr. Robert Dalzell, on "The Pleasures derivable from the study of the Sciences," in which the speaker took occasion warmly to oppose the anomalous idea of the works of God leading to a dislike or repugnance to the word of God; Mr. Andrew Anderson, on "The Characteristics of our Age," which he demonstrated to be mainly progress and individuality, or the onward progressive motion of the whole mass, as individuals in the first place, and consequently, also, in their conjoined capacities, and showed the necessity of so bestirring ourselves as to keep abreast with the spirit of the age.

Wines and fruit were then handed round to the company, and the chairman gave in succession, each prefaced by appropriate remarks—"The Queen"—"The Prince Consort and Royal Family"—"Houses of Parliament"—"The Glasgow Literary Institute," which were received with all the honours—"The Corresponding Members," responded to by Mr. Bryson, the corresponding secretary, who proposed the health of

the old members of the society, who, though not now of the society, were to-night with them. A succession of toasts, literary and otherwise, interspersed with songs and recitations, continued to enliven the proceedings of the evening. A few minutes before eleven, Mr. John Robb proposed, in a highly eulogistic speech, the health of the chairman, the founder of the society, which

was rapturously received; immediately after which the company broke up, highly delighted with the proceedings of the evening. We understand the enthusiasm of the meeting is likely to result in a large increase to the membership of the society. We earnestly hope it may be so, and wish them a large amount of success in their undertaking.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

84. Can any of your readers give me information respecting the art of Venuliloquism, and say whether there are any treatises published on the subject?

85. Being desirous of becoming proficient in the science of Navigation, and not feeling satisfied to take things as laid down in works written on the subject without knowing the *why* and the *wherefore*, I shall feel greatly obliged if you, or any of your contributors, will kindly inform me whether there are any elementary spherical trigonometrical works applicable to navigation published? by whom, and at what price? Your reply, in "The Inquirer," will oblige,—A SAILOR.

86. Two works of high character having been, by different friends, strongly recommended to me as a theological student, both of which I cannot afford to purchase, but wish to get that one which in the opinion of competent judges possesses the most merit, displaying alike the soundest reasonings, from acknowledged premises and acutest theological criticism, may I request from those of your readers whose studies may have led them to become acquainted with and compare the two together, the favour of their opinions upon their respective merits? The works I allude to are Dr. Bloomfield's "Greek Testament, with English Notes," in 2 vols.; and the Rev. H. Alford's "Greek Testament," in 2 vols., of which only vol. i. is yet published.

From the little I have seen of Mr. Alford's work, he appears to me to be deeply imbued with Rationalism (falsely so called), allowing the gospels no more weight or authority than what we should allow to mere memoirs of our Lord's actions on earth—notes of a bystander on his discourses; and doing his best to undermine their claims to inspiration, according to the ordinary interpretation of that term. But I do not wish to prejudge Mr. Alford's performance; all that I desire is the decision of some person capable of forming a correct one, upon his merits as a theologian, compared with Mr. Bloomfield.—FIL.

87. Is the study of the classics and foreign languages indispensably necessary to a young man who has not got much spare time, and who intends gaining efficiency in the force of language and expression as a literary man and public speaker?—T. G.

88. Perhaps one of your correspondents will inform me of a good work on English composition. I have Cornwell's "Young Composer," but if I can obtain a better work I shall be glad to do so.—H. C. D.

ANSWERS TO QUESTIONS.

89. *Pantheism and Rationalism.*—We are pleased to observe that "Republican" recognises the fact, "that much knowledge comes of humility." Those who desire to *know*, wrong themselves by curbing the spirit of inquiry. We have consulted some of the most modern and best authorities within our reach on the points of inquiry now before us. Pantheism is defined to be "the doctrine which teaches that the universe is the supreme God," or more fully, "a philosophical species of idolatry which maintains that the universe is the supreme God. Some persons, however, have also applied the word Pantheism to that doctrine of theology according to which God's spirit not only pervades everything, but everything lives through him and in him, and there is nothing without him," Acts xvii. 27, *seq.*; Ephes. iv. 6. *Pantheistic*—confounding God with his works. These are from Maunde Craig (author of the "New Universal Dictionary" defines thus:—Pantheism (*pan*, all; and *Theo*, God, from the Greek). In metaphysical theology, the theory which identifies *nature*, or the universe in its totality, with God. *Pantheist*—one who adopts the theory of Spinoza, that the universe is God. *Pantheistic*—in sculpture a term applied to statues and figures which bear the symbols of several deities together, the meaning of which has been a subject of much dispute among antiquaries. **RATIONALISM**—a system of theology which began to be developed in Germany during the latter half of the last century. The followers of the system deny the divine origin of the scriptures. They differ from the Deists (who maintain that the Bible is the product of fraud), and allege that notwithstanding all the apparent incongruities of the Bible, it is based on historical foundations, and ascertain which is the problem of reason. The authors of the biblical books, according to the Rationalists, were not impostors, but men of moral purity, who, being deluded by their imagination, considered things to be miraculous which were only natural occurrences. Other portions of the Bible, they say, which have hitherto been considered as recording supernatural events, need only to be divested of the figurative mode of expression peculiar to all eastern nations, in order to appear as the records of ordinary occurrences. The theologians who first came forward as advocates of this new system were Semler, J. D. Michaelis, and J. G. Eichhorn, who were considered its chief supporters, until Paulus joined their ranks. The Rationalistic system of interpretation has been chiefly confined to the Old Testament, although many passages in the New

outlined as open to be tested in all passages so marked, it is considered as figurative expression, thus a happy chance is being seized as a verbal play on an object, as for Harry in the branch occurred among the ends of which was the springing hypermetabolite. These theory considered a several form of nature remain for its role quick structural revision. The only one it shows the tabular records witnesses and manifestations, the conclusion that it is study a from these persons which are all of mythical stories, anything—thereby in fact, fully denying all as its sacred origin. To be the "National Lycopodium" of Naturalism had been applied a study to portions of the old has lately been carried out in the reference to the books of the y. Dr. de Vries, Harry, Thomas, and, "Das Leben eines Botanik" reads. This work the profound great learning produces self-sufficiency, has called forth a host of but the best efforts against it by the hypermetabolite school, its first term, seems to have arisen from new work and the verbal wranglings of Strauss and but between this school and the is still going on. Both parties enough to give way whenever solid points have been proved to be in manifest from the "Life" of a few years ago by Haeckel. Second editions of the work of C. W. Jan.

of Helmer Wenderer—Your Filolia, quotes from "Chilids" using lines—

that, careless glances
I Helmer Wenderer here,
a look beyond the dark,
a hope for rest before

now, I am convinced that the old style, in her old, concrete wonder— who in gloomy death, yet finding no consolation on them he who first of Helen now of's blood—the ancient Cain.

T. H. H.

a question of "Filolia," I think of it. Byron refers to the wild game but, the French novelists, and still has novel called "It runs then (as near as I can see) before, where he was about what his own, and then as he was a very young he wished to rest the door of a Jew. The great would not permit him to do so. He on, then about not rest here as required. "Then with not a, further doubt than ever rest upon him the outcome of branch (all the day of judgment).

ANTI-SCIENCE.

72. History—We do not know what amount of education Harry and previously well-digested information A. H. H. has at command to aid him in his work to enter on the study of Botany, but, certainly, he will need them both for in no branch of scientific research are the qualities of order in thought and methodical arrangement of information so thoroughly or indispensable as in the prosecution of botanical researches.

The distributors that meet the student of this subject at the outset will be found in exact ratio to the state of preparation he brings to the task. If accustomed to passive study and continuous observation the student of the physiology of plants will not present insuperable toil. And, if acquainted with the course from whence scientific nomenclatures are drawn, the terminology of history will be deprived of that formidable appearance it wears to the novice.

But if the student does not possess these preliminary substrata of knowledge he will find it necessary to proceed with caution and severity of application, which if he be courageous, will work a valuable result in strengthening his perceptions and enlarging his views.

The branch of natural history is usually divided into three sections of Systematics, Physiology and Economic Botany, the meaning of these terms is sufficiently obvious.

Before any system of classification can possibly be constructed whether natural or artificial, the various parts of which a vegetable body consists must be clearly defined. It is therefore of paramount importance that the student should thoroughly acquaint himself with the external form and appearance of the stem, roots, stalks, buds, leaves, appendages, flowers, and fruits of plants.

Having obtained a competent knowledge of the several component parts of vegetable bodies the inquirer will perceive the reasons of the principles that form the basis of a natural system of classification. The outline of which is here subjoined.

Matter composing vegetable bodies takes generally one of two forms—either that of a cellular substance which may be said to bear a resemblance to the flesh of animals, or a vascular tissue, analogous in its appearance to a system of nerves and veins.

Of these two classes the vascular are by far the most numerous and varied in their development, and have been divided into subclasses according to the number of the vascular tubes in each individual. Monocotyledonous plants having one vascular tube or cylinder, and dicotyledonous plants which have two or more cylinders, to these has been added the tribe of acotyledonous plants destitute of any tubes though most plants of this class, it should be observed, living in the wilderness.

The divisions thus marked by the preliminary appearance of plants is still further developed in the leaves and arborescence. In a comparison between the leaves of a monocotyledonous and dicotyledonous plant, it would be found that the principal veins of the former arrange themselves into nearly parallel lines of equal thickness; whilst in the latter there will be found a large vein up the centre of each leaf, from which smaller veins proceed on each side, branched by still smaller veins, and presenting a reticulate appearance.

The ligneous portion of a dicotyledonous plant consists of pith, wood, and bark, which the sap increases every year by a fresh deposit of fibrous matter just within the bark; presenting the well-known appearance in timber cut transversely of concentric rings. From the manner in which dicotyledonous trees are increased by successive layers on the outside, they are also termed exogens, signifying to increase externally.

The trees belonging to the order of the monocotyledons are all natives of the tropics, and the germinating principle goes on in the centre of the trunk, which, pressing against the outer cuticle, causes its densest wood to be found at the bark; these trees have neither concentric rings nor medullary rays, and when cut sectionally present a mass increasing in porosity, from the above-mentioned reason, as it approaches the centre. These trees are also called endogens, signifying to increase internally.

These two orders have all visible flowers, and are called phanerogamæ; but the inflorescence of the acrogens being invisible, they are termed cryptogamæ, or hidden flowering plants. The most remarkable of the cryptogamous plants are the aborescent ferns of the tropics, which attain a height of forty feet, and present from their finely indented fronds a beautiful appearance.

Beside these primary divisions, the dicotyledonous plants have been divided into the dichlamydeæ, or those having both calyx and corolla; and the monochlamydeæ, or those having only a calyx. The monochlamydeæ are not subdivided; but the dichlamydeæ are again divided into the thalami-floræ, calyci-floræ, and the corolli-floræ, divisions dependent upon the position of the petals and stamens.

The monocotyledons have also been subdivided into the petaloid, or those with regular flowers, like the bulbous plants and the orchidacæ; and the glumaceous plants, or those that have scales or glumes, as the gramina.

The acotyledons are divided into the soliacæ, or those with leaves, and the aphyllæ, or those without leaves.

Each of the sub-classes before mentioned is divided into numerous orders, differently arranged by different botanists. They will be found enumerated in any elementary work on the subject, and to such we refer A. B. M.

From the above rapid resumé it will be seen that the principles involved in a natural system of botany are very simple, and easily to be comprehended, when once a competent knowledge of the anatomy of vegetable bodies is attained.

Indeed the whole range of natural sciences furnishes no pursuit of such a variety and beauty of development as the study of botany; for, when the grammar of the subject has been studied and conquered, and the anatomical detail and classification of plants has been overcome, and each part and order is clearly understood, sources of investigation open themselves to the eye of the student, in numbers and novelty, of which the uninitiated or incurious have little or no conception.

The vestments of beauty that the hand of God has flung with such profusion and splendour over the entire globe, offer boundless fields of research to the diligent investigator. And whether *his operations are conducted amidst the gorgeous and singular richness of the tropical plant life,*

or the more delicate beauties of the temperate zone, or even the scanty and amorphous vegetation of the polar latitudes, he cannot fail of his reward, and with wonder and devotion will be constrained to say, "What has God wrought!"

T. W. I.

The most economic, and perhaps the best, way for A. B. M. to acquire a knowledge of Botany, will be to procure, first, Lindley's "Introduction to Botany," price 18s. (Longman and Co.); then, the first part of Hooker's "British Flora;" and much assistance will also be rendered by Lee's "Botanical Looker-out"—a work which informs you what to search for each month of the year, and how and where to search. One thing you should understand, and this is, that none of the works named pretend to give you insight into the nomenclature of garden plants: the most of these are of artificial origin, and can only be fully understood by practical research and observation.

A. P. C.

80. *The Study of Phrenology.*—For the study of Phrenology, G. G. cannot procure a better work than Dr. G. Combe's "System of Phrenology," in two vols., which may be procured, second-hand, for a mere trifle—or for beginning the study, the "Elements of Phrenology," by the same author, will perhaps answer as well. With the help of one of these, and a phrenological bust (to be had of almost any chemist), he will be able in a very short time to fix in his memory the relative position and size of the various organs, a task absolutely necessary to ensure a ready application of his knowledge to the discovery of character. There is nothing, however, which will so effectually aid his progress as a careful and discriminating examination of the craniums of living subjects (himself, his relatives and friends, &c.), taking care to form no hasty conclusions at first, as the most skilful phrenologists are liable to mistake, from their losing sight of the principle that one organ, bad or good, if largely developed, may be balanced by the equally large development of another of opposite character. For instance, the organ indicating benevolence may be large, and its beneficial influence nevertheless imperceptible, owing to the undue development of acquisitiveness.

F. J. L.

G. G.—The determination at which you have arrived will materially assist you in obtaining a knowledge of the science of Phrenology. We had occasion to speak last month of the necessity for *determination* in the acquisition of knowledge. We need therefore say nothing more on this point now. The works you may consult with most advantage, are—first, George Combe's "Elements of Phrenology," price 3s. 6d.; then, "A System of Phrenology," by the same author, price 1l. 1s.; and afterwards, "Functions of the Cerebellum," by Drs. Gall, Vimont, and Broussias, translated from the French by Geo. Combe, price 8s. Also "Selections from the Phrenological Journal," edited by Robert Cox, price 5s. 6d. These are all published in London, by Simpkin and Co. and Longman and Co. There are many other works upon the science, both English and French, but the foregoing will furnish you with the "sum and substance" of all.—C. W., Jun.

82. *Knowledge of Conveyancing.*—Orion.—The first step you should take in order to acquire a knowledge of the principles of Conveyancing, is to make a careful perusal of the second volume of

se's "Commentaries," and the first volume of Williams's "Commentaries;" also Williams's "Principles of the Law of Real Property," and "Principles of Conveyancing." From these books you will derive much information and the perusal (that is, the careful reading and consideration) of them all will make you a good conveyancer, or at least might do so, as we presume you to be, in an attorney's office. I think of becoming a member of the legal profession, we would call your attention to the "Law Student's Magazine," published monthly, No. 13, Carey-street, Lincoln's Inn. In your preliminary studies you will derive full and sound practical information from it: at the present moment, however, it is peculiarly adapted to your purpose, and it happens to know that its editors have entered into an arrangement for the publication of a series of letters on conveyancing, devoid of technicalities which too often obstruct the student; and written by a gentleman in the conveyancing department. These letters will, we believe, appear in the "Magazine" this day, March 1st.—C. W., Jun.

As I do not come within the designation to whom "Orion" directs his inquiry, as a "reviewed correspondent," having only entered upon the study of Conveyancing, and it being my practice, when I come to a new subject, to have the advice of as many experienced persons as possible, I have in this had the opinion of many clever and experienced men in the profession on this subject (through their writings), and, therefore, I think it will not be thought presumptuous in me to say only, like the inquirer himself, a "blind leading the blind," for me to make a few remarks on the subject, as in thus doing I am only expressing the practical of really experienced persons on this subject. The first book, and easiest to be understood by the young student, is Williams's "Principles of the Law of Real Property," published by Chancery-lane. This work I have read with great profit, and, therefore, I can be said to have an experienced decision on it, though I have not read any of those which come after. The second volume of Blackstone's "Commentaries" should be taken up. This book contains authorities that I have seen highly recommended by them; they advise even three or more careful readings of it. Sergeant Stephen's "Commentaries" might be used in lieu of Blackstone's.

Then follows Burton's "Compendium of the Law of Real Property." This is a masterly and practical treatise. To use his own words in his preface, "It has been the author's endeavour to adapt his work (though intended to be as complete as possible in itself) principally to such readers as, being already acquainted with Blackstone, are desirous of further progress." Afterwards the following works may be advantageously read—Sugden's "Powers;" Sugden's "Vendors and Purchasers;" Haye's "Conveyancing;" Coote on "Mortgages;" Sanders' "Uses and Trust" ("the doctrines of uses and trusts," says Sheppard, in his "Touchstone," "is of the first importance to a correct knowledge of the law of title"); and Woodfall's "Landlord and Tenant." Then, to use the words of the author of one of the treatises on this subject, "Having mastered these works, the student will be prepared for all ordinary transactions. He may safely add any other modern treatises which are considered of authority." He should also take up reports, but here he must use discretion. "He may, we think," says one of my works, "safely leave the elder reporters, and keep them merely as works of reference; but he should read all the cases upon the law of property in the more modern reports, beginning with Atkyns in the courts of equity, and Lord Raymond in the courts of common law. This, of course," it continues, "will be a work of time, and must be necessarily disturbed by business, but we should advise its steady pursuit if time will allow." If the inquirer is a student intending to enter the ranks of the profession, there is a work, published monthly, which I would especially recommend to him, viz., the "Law Student's Magazine," price 1s. 7d. It contains really valuable information, being totally devoted to the wants of the student. Any information you may require on legal subjects, the editors, as I know by experience, will kindly give; and although you can generally get advice on such questions as the one now proposed by you, through the kindness of the editors of this periodical, yet such a question being entirely of a legal nature, more properly belongs, and is more fit for, the "Law Student's Magazine" than the "British Controversialist." I hope that the above remarks on the study of conveyancing, which I have culled from different authors, will contain the information that is required on the subject; but should more be required, I shall do all that lies in my power, with the aid of my books, to give it, and for that purpose forward my address.—D. H.

The Young Student and Writer's Assistant.

LOGIC CLASS.

on the Art of Reasoning.—No. XIII.
Describe the state of Greek Philosophy and Aristotle.
Give a brief abstract of the Aristotelic Logic.
Explain the Categories.
Define the following terms into their regularities, and state why:—65, Pater-

noster-row — Turkey-red — twenty-six — circulatory — queen — bolt upright — was inflated — parallel-logram.

5. Distinguish between Extension and Comprehension, and give examples.

6. Define and exemplify Quantity and Quality.

7. Define and exemplify Subalternation and Opposition.

8. What is Conversion?

GRAMMAR CLASS.

Exercises in Grammar.—No. II.

1. Construct a form similar to that given below, and arrange the following nouns in their proper columns:—London, being, book, affliction, whiteness, house, Liverpool, seeing, John, highness, multitude, slavery, manhood, friendship, congregation, laughter, Southampton, pen, son, knowledge, paper, parliament, hearing, feeling, committee, affection, belief, hope, Louis, nation, man, concourse, heart, intentions, king, revolution, America, seed, herd, bloom, shadow, maid, flock, trammel, queen, prince, Victoria, Albert, gardener, Henry, rector, executrix, affinity, region, crasure, attendance, acrimony, fallacy, ardour, animalcule.

NOUNS.

PROPER.	COMMON.		
	Collective.	Verbal.	Abstract.

2. Supply definitions of the various parts of speech, and give examples of each.
3. Explain the difference between abstract and verbal nouns.

MATHEMATICAL CLASS.

SOLUTIONS.—I.

Arithmetic and Algebra.

1. As the weight of a cubic foot of water is 1000 oz., and cast-iron is 7.248 times heavier, the weight of a cubic foot of iron = 1000×7.248 oz. = 7248 oz. Therefore the number of cubic feet in the whole mass equals the number of times that 7248 oz. is contained in it. Thus—

$$\text{No. of c. ft.} = \frac{1500000 \times 20 \times 112 \times 16}{7248} = 7417218.543$$

$$\therefore \text{Side of the cube} = \sqrt[3]{7417218.543} = 195.02$$

H. E. D.

$$2. \text{Area of field} = 950 \times 870 = 826500$$

$$\text{Area of ditch} = \frac{950 \times 870}{20} = 41325$$

Let x = the width.

Length of ditto = $950 \times 870 - x$ by quest.

Area of ditto = $x(1820 - x) = 1820x - x^2$

Another expression for area.—Change all the signs and transpose:—

$$\text{Then } x^2 - 1820x = -41325$$

Complete the square, and we have

$$x^2 - 1820x + 910^2 = -41325 + 826100 = 786775$$

$$x - 910 = + \sqrt{786775} = 887.03$$

$$\therefore x = 22.97, \text{ or } 1797.03.$$

The width of the ditch, therefore, is 22.97.

J. B.

3. Let $2x$ = the number of coins of the greater value.

$2x$ = the number of the lesser. Then by the question—

27 ($2x$) and 21 ($3x$) are their respective values.

$$\therefore 54x + 63x = 1287 \text{ shillings.}$$

$$\therefore 117x = 1287$$

$$\therefore x = 1287$$

$$\frac{117}{117} = 11$$

$$2x = 2 \times 11 = 22 \text{ number greater.}$$

$$3x = 3 \times 11 = 33 \text{ number lesser.}$$

$$\text{Proof:—} 22s. \times 27s. = £29 \text{ } 14s.$$

$$33s. \times 21s. = £34 \text{ } 13s.$$

$$\text{Total.....} £64 \text{ } 7s.$$

W. R. C.

4. Suppose 1s. given to each common soldier; then each lieutenant had 2s., and each captain 6s., and the total amount given would be $135 + 24 + 54 = 213s.$ But the actual total amount we find to be 35,997s., or 169 times the supposed sum: therefore the sum given to each will be 169 times the supposed sum.

\therefore Each private received £8 9s.; lieutenant, £16 18s.; captain, £50 14s.

C. D. S.

Geometry.

1.—First Solution.—Let ABC be the triangle of which the side $AB = 1290$, $BC = 555$, and $AC = 1390$. It is required to find the perpendicular, BD falling upon the greater side AC . Bisect the base AC in E . Then (Euc. 47, 1 Cor.) $AB^2 - BC^2 = AD^2 - DC^2 = (AD + DC)(AD - DC)$ (1). For the difference of the squares = the rectangle under the sum and difference. Now $AD - DC = AC - 2DC = 1390 - 2DC$. Substituting this value in (1)

$$E D = \frac{AB^2 - BC^2}{2(AD + DC)} = \frac{1290^2 - 555^2}{2(1390)} = 487.79.$$

$$\text{But } DC = EC - ED = \frac{1390}{2} - 487.79 = 207.21$$

$$\text{And } BD = \sqrt{BC^2 - DC^2} = \sqrt{555^2 - 207.21^2} = 514.86.$$

W. S. G.

1.—Second Solution.—Conceiving the two sides of the triangle to be 1390 and 1290 links respectively \therefore we have per trigonometry $555 : (1390 + 1290) :: 1390 - 1290$, or $555 : 2680 :: 100 : 483.9$, nearly \therefore for one of the segments, we shall have $(555 + 483.9) \div 2 = 519.45$, and for the other segment of the base $555 - 519.45$, or 35.55. Hence (Euc. b. I. Prop. 47) $\sqrt{1290^2 - 35.55^2} = \sqrt{1664100 - 1263.80} = \sqrt{1662836.20} = 1289.5$ links nearly.

The above process may be proved as follows:—Let ABC be a triangle, and from centre C with the distance of the greater side AC , describe the circle GAF , and demit CD perpendicular to AE . Now it is clear that GB = the sum of the sides AC and CB and BF = their difference. But $AD = DE$ (Euc. iii. 3) $\therefore AB$ = the sum, and BE the difference of the segments of the base, whereas GB = the sum, and BF the difference of the sides of the triangle. (From Euc. iii. 35, $AB : GB :: BF : BE$.)

POOLLEY.

2. 1848×408 = area of the building. Let x = the diameter of the circle of equal area.

$$\text{Then } x = \frac{\sqrt{1848 \times 408}}{7854} = \sqrt{900000} = 979.79. \text{—Ans.}$$

J. B.

Mechanics.

1. To answer this question it is necessary to find—1st. The weight of the stone; and—2nd. The space through which the centre of gravity would be moved to turn it on its edge. These two things will enable us to find out the units of work necessary to do it:—

1st. The weight of the block, or stone = $7^3 \times 170 = 58310$.

2nd. The distance through which the centre of gravity must be moved to turn it on its edge.

Let A B C D represent a section of this stone. The distance of c from A, the edge, B C =

$$\sqrt{3.5^2 + 3.5^2} = \sqrt{24.50} = 4.949$$

When the cube is on the point of being turned, the c will be at a in the direction A B, and will therefore be elevated in the perpendicular direction a.

$$r a = 4.949 - 3.5 = 1.449.$$

\therefore Units of work necessary to overcome gravity = $58310 \times 1.449 = 84491.19$. J. E.

2. A horse is calculated to perform 33,000 units of work per minute: multiply by 70 the number of horse power, and 60 the number of minutes in an hour = the number of units of work done per hour. The weight of a cubic foot of water = 62.5 lb.; this multiplied by 120×6 the number of feet that the water has to be raised = the total work in raising the water. \therefore Number of feet

$$\text{raised per hour} = \frac{33000 \times 70 \times 60}{62.5 \times 120 \times 6} = 3060$$

R. J.

QUESTIONS FOR SOLUTION.—III.

Arithmetic and Algebra.

1. There is a field containing 10 acres, which

the proprietor intends to cover with clay to the uniform depth of 4 inches: the clay is to be taken from a pit to be dug in one corner of the field, 14 feet deep. Supposing 12 feet of this to be clay, what will be the area of the pit?

10. The value of standard gold at the Mint is £3 17s. 10½d. per ounce. Its specific gravity 17.629. Required the content of a lump which would pay the national debt, supposing it to be £780,000,000 sterling.

11. Extract the square root of 9781.21, and explain the principle of the operation.

12. Find the least common multiple of 7, 11, 19, 26, 104, and 180, and explain the process.

Geometry.

5. A cubic inch of glass is blown into a sphere of uniform thickness, capable of containing a gallon of water. Required the thickness of the glass.

6. Divide a given right line (A B) so that the square of one part shall be equal to the sum of the squares of the other two.

Mechanics.

5. The height of a waterfall is 10 feet; the quantity of water which falls over per minute, 350 cubic feet; the modulus of the wheel, .6. Required the horse power.

6. The long arm of a lever of the first kind is 4 feet; the short arm 6 inches. What power must be applied to lift a weight of 2 cwt., supposing the lever to be without weight?

Erratum.—In question 6, Arithmetic, instead of "empty cistern be filled," read "full cistern be emptied."

Notices of Books.

A Lecture on the Civilizing Influences of Christianity. By Rev. W. Shepherd, B.D. London: Hall, Virtue, and Co.

Notwithstanding that there are some dark clouds in our social horizon, it is still admitted by all impartial observers that there has never before been a civilization more complete in all its bearings than that of the present day. Other ages and countries may have possessed a civilization more captivating, and in a certain sense more brilliant, but never has civilization been so deeply rooted and so lasting in its character, as it is now. Various causes have been assigned for this: for on so interesting a matter, of course there has been much speculation. That religion has a powerful influence upon the present state of society, no one can for a moment doubt; and to trace out and shew us how this religious influence is exerted, is the object of the present lecture. That such a subject is worthy of the most careful investigation all will admit; and we are glad that it has been handled by a writer of Mr. Shepherd's ability. Such subjects are generally considered to be

"When unadorned, adorned the most,"

and hence, with a clear arrangement and appropriate language, Mr. Shepherd has advanced plain truths, and left them to strike home to the hearts of his readers. But let the writer at once speak for himself:—

"I said I would consider the subject as a citizen of the world, but I can scarcely realize the existence of such a character in a christian country; for we are so surrounded by the influences I would speak of—their effects have become so interwoven with all our habits of body and reasoning of mind—we have associated them so entirely with our outward walks and private paths of life, that we scarcely know how to disengage ourselves from their spell, so as to become conscious of their existence and importance, because we cannot form any distinct conception of what would have been the effect of their absence or non-existence. Indeed it is not too much to say that in this happy land of ours—this home of refined elegancies and domestic enjoyments—this abode of civil peace and systematic order—where although the highest and lowest ranks of life are placed at an almost immeasurable distance apart the various intermediate grades of society are so

fully expressed that they appear to amalgamate in one consistent and harmonious whole—the obdurate influence of Christianity form the vital momentum of public greatness and private happiness, irradiating the palace, illumining the mansion, smiling on the family hearth, and brightening sunshine on the cottage.

Again —

“For if the influence of Christianity have done and accomplished as much—as I trust to make it apparent to you by a few broad and simple facts that they have done—and that too in defiance of powerful obstacles courageously arrayed against them, is not this an evidence how excellent they must be in principle—how beneficial in operation—how valuable in possession. The evidences of this fact are not confined to one spot or epoch—neither shall we rest satisfied with one proof only—for they who would establish a great principle or evolve from their obscurity the operations of a beneficial system, must be prepared with something more than assertion—they must surround their argument with proofs—and make their proofs not only easily tested, but not only easily with their argument. . . . It is one of the most striking benefits of the influence I am speaking of that it confers not its operation to this or that individual class, but some class and affects alike all ranks and conditions of men shining not by contrast of merit but by comparison with itself, neither by the displacing of a rival, nor the humiliation of a competitor, but made evidently by its magnitude of purpose expanding into one equal and comprehensive circle of action.”

Lastly —

“In these and many other respects I believe I have proved itself a more efficient refiner of public morals and private discernment than the studies of philosophy or the controversies of reason. Its distinction is of a nobler, a more authoritative and more diffusive character. It does not give the bare moral as we to give it a spurious reality, but it rather stamps the refined one with the impress of sterling value unadulterated worth. For as a writer long since well remarked. All those things which relate to moral knowledge, taken in its widest extent, were understood by the ancient Egyptians, Greeks, and Romans, in as great perfection as the things themselves are capable of. The art of governing kingdoms and families, of managing the affections and tames of the untamed multitude, of ruling these passions, and discerning concerning these several ways of working, of making prudent laws and laying down wise methods by which they might be the more easily and effectually obeyed, of conversing with each other, of giving and paying all the respect which is due to them several qualities, in short, all that is commonly meant by knowing the world and understanding mankind, all things necessary to make man wise in counsel, cautious in business, and agreeable in conversation, seem to have been in former ages thoroughly understood and successfully practiced. . . . But after all, how weak the knowledge of the ancient heathens was, even here will appear by comparing the writings of the old philosophers with those moral rules which Solomon left us in the Old Testament, and which Christ and his apostles laid down

in the New. Rules so well suited to the reason of man, so well adapted to civilize the world, and to introduce that true happiness which the old philosophers so vainly hoped to find; that the more they are understood the more they will be valued—and accordingly they have attracted even from those who did not believe the Christian religion just applause which were certainly unearned because not being led by the rewards which it proposes, nor deterred by the punishments which it threatens, they could have no motive to recommend them but their own native excellence.”

The lecture is neatly got up, and is published at a price which places it within the reach of all.

Supplement to Etymological Dictionary of Scripture Names. By W. & H. M. London: Hamilton, Adams, and Co.

We are glad to perceive that Mr. Hird is busily pursuing his self-selected branch of labour for the time which he seeks to explore in rich in interest and instruction. This Supplement to his “Dictionary” contains some valuable information, but above all, a general index, according to the suggestion we gave a few months ago, which suggestion, it appears, after critical revision, and he grandfully acknowledges.

Præter in German, adapted for Self-Instruction. By Felix Leblin. London: Whittaker and Co.

This is a useful work, especially for those who wish to study German “without a master.” The author successfully aims at enriching his learners with simplicity and interest. Remembering that to most persons grammar seems dry and difficult, he has selected for his illustrations such gems of thought and useful and interesting information as are likely to impress the memory with worthy sentiments, and relieve the dulness of minute instruction. Believing that the best instruction is that which ultimately gives the greatest facility and shall be positive and that a thing is most easily learnt by that process which brings it most directly home to the habit and thought of the learner, Mr. Leblin proceeds on the principle of working German through its affinity to English. In various instances where the two idioms differ now he adduces examples to prove that a similar construction or expression actually exists or once existed, in English. Some of the examples quoted are given merely to show the affinity of the two languages with a view to render the German expression more familiar to an English ear or perhaps to interest the inquiring student. From the numerous inquiries which we have received respecting the study of the German language, we feel sure that we have said sufficient to direct our readers’ attention to this work.

The Characteristics of the Age, Viewed in Relation to the Position and Responsibilities of Young Men. By Rev. Ledy Buren. Dundee: F. Shaw.

This is one of that series of lectures to the “Dundee Literary and Scientific Union,” which was commenced by Dr. Duff, whose production we noticed in our January number. The present lecturer has chosen an important subject, and has

handled it in a masterly manner. He seizes upon the following characteristics of the age, and brings them practically to bear on the position and responsibilities of young men:—1st. Its immense facilities of communication, and consequent opportunities of influence between man and man. 2nd. Its gigantic social evils, and its noble struggles for their amelioration. 3rd. Its industrial activity and vast commercial expansion. 4th. Its matured science. 5th. Its diffused information. 6th. Its moral earnestness. We append an illustrative extract from his remarks under the first head:—

"Here we need no elaborate induction of particulars, but simply to bid you look around to what is going on everywhere before your eyes. In three simple facts—the railway line, the ocean steamer, and the electric telegraph—there is wrapt up the history of centuries. Here is no ordinary step in the onward progress of human things, but a vast revolution, an unmeasurable stride in the providential development of our race, introducing us at once into a new world. Just try to realize the significance of this one plain matter of fact, that thought now travels through thousands of miles on its iron pathway more quickly than the words that express it are pronounced! The time taken to utter the sounds and to indicate them on the electric dial-plate is measurable, but not the time they take to fly from London to Paris. The Queen's speech is printing in Edinburgh, while still the royal cortege is wending its homeward way to Buckingham Palace. The French *coup d'état* is known in London, while still the placards that announce it are wet on the walls of Paris. The fights of the faubourgs and the barricades are known to us while still in progress, as though the very winds conveyed to our ears the booming of the cannon, and the sharp rattling of the musketry. And this state of things will increase more and more. The new system of communication, already in such active progress, will proceed apace, and soon pervade the whole civilized world. St. Petersburg, Vienna, Berlin, Rome, Constantinople, Calcutta, Peking, possibly even Washington and New York, will soon be practically as near to us as Paris is now. Every civilized state—the whole continental part of both hemispheres, will inevitably be, ere long, one network of railway lines and electric wires; and the great ocean steamers will complete the communication between the most distant shores. Already the Mediterranean—that ancient high-street of the world—has become but as a side street, and the great Atlantic is the crowded thoroughfare of nations; arrangements are in progress for spanning by steam transit the vast interval between Southampton and Australia; and the scheme has been hopelessly thrown out of a great eastern line running along the Mesopotamian valley, straight into the very heart of the oriental world. Strange to think of express trains rushing over the very road which erewhile Abraham traversed with his pilgrim staff—of the railway whistle echoing along that very valley of Shinar, where, when the world was young, Nimrod wound his hunter's horn! These are not flights of the imagination, but the sober realities of the age we live in. Think of it as we may, and draw from it what inferences we may, the fact is plain and indisputable. The ends of the earth are coming rapidly together; the different nations of mankind are

fast becoming one community; time and distance, hitherto the great barriers of nations, are passing away, and permitting the different races and tribes of men to meet and blend together as one people—as one brotherhood.

"Nor do men in general seem backward in availing themselves of this increased and increasing means of communication. They seem quite ready to strike hands and exchange thoughts freely with their brethren. Never were the minds of men more busy and prolific, pouring forth their thoughts through all the channels of the press into ears of their fellows. Twenty years ago Menzel reckoned the yearly tide of volumes issuing from the German press at ten millions—the number of new works at six thousand. Since that time the rate of production, which was then rising by two thousand every five years, must be very largely increased. Add to this the teeming authorship of France, Britain, America, and other less productive nations, not to speak of the incessant snowstorm of lighter literature from the newspaper and periodical press, and you will have some faint notion of that mighty tide of thought, that is unceasing pouring forth from the human mind, and flowing through all the ducts and channels of communication to the ends of the earth. Verily, in our day many run to and fro, and knowledge—knowledge such as it is—knowledge good and bad—knowledge ranging from the highest and holiest truth to the most vile and poisonous error—is inconceivably and most portentously increased.

"The bearing of all this on the duties and responsibilities of our young men is manifest enough. An age of vast influence is necessarily an age of vast responsibility. Now if ever, it is, that a man may on a great scale benefit his fellows, and live to signal purpose in his day and generation. Now, if a holy energy fire our breasts, and great and worthy ends are set before us, the beneficent influence of our career may be not only imperial, but world-wide. Now, surely, is the time for our generous and devoted youth to be up and doing; to be essaying noble deeds, and quitting themselves like men, in the great struggle of truth and of humanity that is at stake."

Selection of English Synonyms. Second Edition. London: John W. Parker and Son.

The fact of this little volume being ushered into the world under the editorship of Archbishop Whately, is sufficient to raise high expectations of it, especially when we find him declaring that "though far from presuming to call it perfect, it is very much the best (work) that has appeared on the subject." This coming from such a man is no mean praise. The subject here treated upon is interesting to those who covet the power of using the "gray-goose quill" with ability and precision, and, indeed, to all who desire an accurate knowledge of the English language. The author evidently possesses that exactness of discrimination and chasteness of judgment so essential to the right performance of the work which he has undertaken. An example or two will be sufficient to convey to our readers an idea of the value of the volume now under review.

"Also, Too, Likewise, Besides.—'Too' is a slighter and more familiar expression than 'also,' which has something in it more specified and

formal. This is the only difference between the two words. 'Likewise' has a rather different meaning. Originally it meant 'in like manner;' and it has preserved something of that signification: it implies some connexion or agreement between the words it unites. We may say, 'He is a poet, and likewise a musician;' but we should not say, 'He is a prince, and likewise a musician,' because there is no natural connexion between these qualities; but 'also' implies merely addition. 'Besides' is used rather when some additional circumstance is named *after* others, as a kind of after-thought, and generally to usher in some new clause of a sentence, as, 'Besides what has been said, this must be considered,' &c.

Again:—

"*Sincere, Honest, Upright.*—'Sincerity' may be used in two senses; and this leads to much ambiguity in reasoning. It may either mean, on the one hand, reality of conviction and earnestness of purpose; or on the other, purity from all unfairness or dishonesty. Many people overlook this; they will speak of a man's being 'sincere,' when they mean that he has a real conviction that his end is a good one, and imagine this must imply that he is 'honest;' whereas he may be 'sincere' in his desire to gain his end, and *dishonest* in the means he employs for that purpose. 'Honest,' on the other hand, is not an ambiguous term; it implies straightforwardness and fairness of conduct. 'Upright' honesty and dignity of character; it is the opposite of 'meanness,' as 'honesty' is of 'cunning.'"

Recollections of a Literary Life; or, Books, Places, and People. By Mary Russell Mitford. 3 vols. London: Richard Bentley.

The authoress well says that the title of this book gives a very imperfect idea of the contents; and it would be difficult to find a short phrase that would accurately describe a work of so miscellaneous a character. Its object is "to make others relish a few favourite writers as heartily as the writer has relished them herself;" and for this purpose she has associated notices of various authors and extracts from their writings, with personal reminiscences and local scene painting; and has thus produced a very readable and even an interesting work. Many of the extracts are valuable, as comprising the best bits of neglected authors: we select the following, from the writings of Abraham Cowley (who lived in the 17th century), although we scarcely know what some of our young and ardent readers will think of it.

"The pleasantest condition of life is in *incognito*. What a brave privilege it is to be free from all contentions, from all envying, or being envied, from receiving or paying all kind of ceremonies! It is, in my mind, a very delightful pastime for two good and agreeable friends to travel up and down together in places where they are by nobody known, nor know anybody. It was the case of Æneas and his Achatas, when they walked invisibly about the fields and streets of Carthage. Venus herself—

"A veil of thickened air around them cast,
That none might know or see them as they pass'd."

"The common story of Demosthenes' confession, that he had taken a great pleasure in hearing a basket-woman say, as he passed—'This is that Demosthenes,' is wonderfully ridiculous from so

solid an orator. I myself have often met with that temptation to vanity (if it were any), but am so far from finding it any pleasure, that it only makes me run faster from the place, till I get (as it were) out of sight-shot. Democritus relates and in such a manner as if he gloried in the good fortune and commodity of it, that when he came to Athens, nobody there did so much as take notice of him: and Epicurus lived there very well, that is, lay hid many years in his gardens, so famous since that time, with his friend Metrodorus; after whose death, making in one of his letters a kind of commemoration of the happiness which they two had enjoyed together, he adds at last, that he thought it no disparagement to those qualifications of their life, that, in the midst of the most talked of and talking country in the world, they had lived so long, not only without fame, but almost without being heard of. And yet, within a few years afterwards, there were no two names of men more known or more generally celebrated. If we engage into a large acquaintance and various familiarities, we set open our gates to the invaders; most of our time, we expose our life to a quotidian plague of frigid impertinence, which would make every man tremble to think of. Now, as for being known much by sight, and pointed at, I cannot comprehend the honour that lies in that. Whatever it be, every mountebank has it more than the best orator, and the hangman more than the lord chief justice of a city. Every creature has it, both of nature and art, if it be anyway extraordinary. It was as often said, This is that Bucephalus, or This is that Incitatus, when they were prancing through the streets, as This is that Alexander, or This is that Domitian; and truly for the latter I take Incitatus to have been a much more honourable beast than his master, and more deserving the consulship than he the empire.

"I love and commend a true good fame, because it is the shadow of virtue; not that it do any good to the body which it accompanies, but it is an efficacious shadow, and like that of St. Peter, cures the diseases of others. The best kind of glory, no doubt, is that which is reflected from honesty, such as was the glory of Cato and Aristides; but it was painful to them both, and seldom beneficial to any man while he lives."

Having given a specimen of Cowley prose, append one of his poetry:—

"A mighty pain to love it is,
And 'tis a pain that pain to miss;
But of all pain the greatest pain,
It is to love, and love in vain.
Virtue now nor noble blood,
Nor wit by love is understood.
Gold alone does passion move,
Gold monopolizes love!
A curse on her and on the man
Who this traffic first began:
A curse on him who found the ore:
A curse on him who digged the store:
A curse, all curses else above,
On him who used it first in love!
Gold beget in brethren hate;
Gold in families debate;
Gold does friendship separate;
Gold does civil wars create;
These the smaller harms of it!
Gold, alas! does love beget!"

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. IV.—THE PHILOSOPHY OF LANGUAGE.

In order to substantiate the opinion regarding the cognation or twin-birth of Thought and Speech advocated in our preceding paper, it might, at a casual glance, appear requisite to prove the original identity of all languages; it might seem that, if thought necessarily and inevitably seeks to be envestured in words—if all men are endowed with essentially similar powers of intellect—if common and universal mind-laws preside over and influence the development of thought—and if Language, which is but the expression of thought, is formatively regulated by the same laws which govern the evolution of ideas—the same or essentially similar phonic syllables should appear in the root-forms of the verbalisms of every human tongue. Our opinion, however, does *not* necessitate such an advocacy of the absolute fitness of certain sounds to express certain ideas. We are *not* compelled by the view which we have taken to establish any natural connexion between sounds and the ideas of which they are denotative. All that it is necessary for us to substantiate is, that in speech-formation men uniformly follow the same course, and consequently that all languages coincide in their generic characteristics. To accomplish this, however, it is far from being necessary that we should trouble our readers with elaborate details regarding the not-similarities of different tongues—with erudite disquisitions on speech-derivation, or lengthy abstracts of the teachings of Ethnography concerning the affinities of Language; we shall sufficiently fulfil our duty if we prove that all languages consist of the same parts—proceed upon the same general principles—emanate from the same mind-laws, and effectuate the same general results. If we show that, amid much seeming diversity, there exists an essential sameness—that similar classes of idea-symbols exist in every language—that coincidence in all the great essentials of structure is observable—that the differences which exist are only in the minor accidents of thought-expression—that little that is capricious or rule-free, and much that is law-functioned, appears in speech, and that the marks of a generic union between ideation and expression are distinctly and obviously apparent—we shall surely be warranted in inferring that Thought and Speech are twin educts of the mentality.*

In order, however, that the principle upon which our theory of Language is constructed may be clearly and definitely evolved, and lest even the shadow of a supposition that we have any desire of shirking the difficulties of the speculative position which we have assumed should enter the mind of any one, we may be allowed to allude, briefly, to one or two of those causes which we regard as having been instrumental in the production of

* Although insisting upon the truth of this proposition as involving many philosophical consequences in our further study of Rhetoric, let it not be for a moment imagined that we retract, modify, or repudiate in any way the remarks made formerly in "The Art of Reasoning," vol. ii. p. 123, *on the distinction between Language and Logic.* Language is the *painting* of thought, and is entitled to employ occasional and accessorial embellishments; Logic is *sculpturesque*, and permits the embodiment of thought only in the beauty, distinctness, and accuracy of *formal* abstractions.

those diversities of Language which confessedly exist upon the face of the globe, and which apparently offer so formidable an argument against the accuracy of our opinion.

1st. Causes influencing the Perceptivity. We have asserted that Perceptivity is the primary element in human thought; but if the objectivities presented to the perceptive organs are different, that difference ought surely to appear in speech. But how diverse are the objects which present themselves to the denizen of the boreal regions from those which offer themselves to the view of the inhabitant of tropic climes! The one dwells amid the accumulated and unmelted snows of many winters—in a land which the sun-rays seldom visit—where miles of ice stretch far away in unchanging continuousness, intervariegated only occasionally by a stunted, sober-tinted vegetation—with a dull, leaden sky hanging overhead, supported on the summit of enormous ice-crag, which rise up everywhere, ruptured, irregular, and jagged, half-curtained with perpetual fogs—where the glacier, the avalanche, and the frosted snow are ever present—where organic and vegetable life dwindle, and at last become extinct;—the other inhabits a region

“Dipped in the orient hues of heaven,”

where the choicest gifts of nature are lavished in profusion—a cloudless sky envelopes the nations—the most beautiful carpets of moss and flowers are annually woven by the rosy-fingered goddess of summer—the trees are festooned with golden and ruby fruits—the animal creation attains its most gigantic development—and all things

“Interpenetrated lie
With the glories of the sky.”

How different in their characteristics, and in the objectivities which impress the human mind, are the lands which border on the ever-rolling sea, from those whose hills are fervid with the beams of heaven—the stormy vitality of the ocean, with its wild liberty and endless change, and the calm majesty of the cloud-piercing mountain, how diverse! The trackless deserts of Africa, which no foliage colours and no moisture bedews—the shingly plains of Patagonia—the forest-valleys of the Amazon—the treeless pampas—the verdure-clad llanos—the Asiatic steppes,—how opposed in feature and in idea-educing elements to the fiery outbursting of the Catopaxi—

“Where Andes, giant of the western star,
Looks from his throne of clouds o’er half the world!”—

the peaks of the Dwalaghiri—the snowy mountains of Sirinagur—and the compressed scenery of Europe, where rock and wilderness, lake, river, cataract, pastoral plain, and inland sea, are heaped and piled together in rude, bold, and savage grandeur! Can men, having such diverse objectivities presented to their gaze, employ the same vocables, or apply the same terms to the innumerable diversities of perceptions with which they are impressed? *

2nd. Causes which influence the Societarian Instincts. From the geographical differences noticed in the preceding paragraph result in a great measure the varieties of national occupation—husbandmen, shepherds, huntsmen, commercialists, &c. The human mind has a natural power of adapting itself to the circumstances in which it is placed, and is peculiarly susceptible of impressions resulting from climate, employment, mode of obtaining a livelihood, &c.; the growth of habits, and of the continued operation of the

same influences conjoined with these, serve to imprint upon the mentality a peculiar type. Hence the character of a maritime nation differs widely in the cast of its thoughts from that of a pastoral people; both differ from the dwellers in the mountain lands; while the occupant of the desert or the forest possesses characteristics distinct from each of these formerly mentioned. Such diversity of habits must originate distinctions of thought, and such differences of thought must produce dissimilarities in Language.

But variety of geographical position, while it changes the occupations, alters the manners, differentiates the thoughts, and diversifies the languages of men, necessitates at the same time a dissimilarity in their social state, their amusements, and their laws; these again re-act upon the thoughts, originate societarian peculiarities, and introduce neologisms into common use.

3rd. Causes influencing the Analogical Faculties. In the earlier periods of society all intercourse is figurative and poetic—poetry is essentially harmonic: whatever tends to display the likeness of the thing spoken of by the sound spoken, not only adds to the readiness with which Language is understood, but also contributes pleasure. The imitative faculties would therefore be early called forth in man; his analogical faculties would lend him to the perception of similarities; and thus Language would be improved and polished by every attempt to give expressiveness to thought.

4th. Causes influencing the Colligating Faculties. War, conquest, and colonization, by bringing nations into contact, would tend to the interfusion and amalgamation of languages. Commerce, by introducing new products with their native name-signs, would add to the copiousness of speech. Discoveries and inventions, by the production of new objects—the eliciting of new ideas—new processes of labour—new combinations of material, and new modes of life, would demand new verbalisms, through the instrumentality of which these new notions and conceptions might be conveniently characterized and readily discoursed about. Words would also lose their primary significations, and by their connexion, real or imaginary, with any important event, would receive a new denotation; while the use of certain verbalisms in figurative senses would also cause a diversity and dissimilarity in the languages spoken by the several nations of the human race. This dissimilitude would be still further augmented by the want of a literature which might form a standard—prevent the formation of dialects—and fix and determine the true and proper use of the national tongue—and might become the referee and controller of discourse.

Having thus shown that certain actively operative causes may have had an influence in the production of the diversity of the languages which men employ, we shall now proceed to inquire what are the several classes into which words may be divided—the offices which they respectively perform—and the mode of their origination in the mind.

Let us suppose a reasonable being placed upon our globe: it is quite evident that the earliest action of his mental powers would lead him out of himself—would make him acquainted with the phenomena of the external universe. But here all is apparently confusion and concreteness—an intertangement of objectivities and their relations—

“A mighty maze—a world without a plan”—

In general and the particular are intermingled—complexity and combination are on every side. The passivity of the intellect, however, cannot long endure. It becomes sensible that

nearly similar phenomena convey impressions to the mentality—the complexity of the primitive facts of perceptivity begins to disappear—the analytic faculties commence to resolve the particular and the concrete into the general and the abstract—sameness of phenomenal power is observed to reside in objectivities which differ slightly in their minor accidents—the rude germs of generalization are sown in the mind—and classification sets itself to the arrangement of all those bodies which meet its view, and are possessed of common qualities, and thus general ideas are eliminated. These ideas must have representative mind-signs appropriated to them. This is a copious source of words, and forms a class of verbalisms which must exist in every language. But we have only as yet supposed the mind to have become sensible of the *objective*; gradually it must awaken to a knowledge of the *subjective*, and then

“Desires and Adorations,
Winged Persuasions and veiled Destinies,
Splendours and Glooms, and glimmering incarnations
Of Hopes, and Fears, and twilight Phantasies;
And Sorrow, with her family of sighs,
And Pleasure, blind with tears, led by the gleam
Of her own dying smile, instead of eyes,
• • • • •
Like pageantry of mist on an autumnal stream,”

must slowly arise all “moulded into thought.” The class of thought-signs thus elicited are called *Nouns*, and may be concisely defined as *the names of any existences, real or imaginary*.

In attaining a knowledge of existences sufficient to enable it to classify and name them, the mind could not avoid perceiving that the conceptions which it had formed were the result of similar combinations of qualities inhering in some *substrata* or *substans*, and that by these qualities alone were the objectivities around rendered cognisable; it must have observed, too, that some were variable and some invariable; that some belonged essentially to the object, and could not be removed from it without causing an alteration in the nature of the idea resulting from it, while others were subject to increase or diminution, and occasionally were capable of being absent altogether without materially changing the generic notion of the object—were, in short, accidental. Hence arises a demand for a new series of idea-symbols—symbols indicative, not of substantial or essential objectivities, but of those attributes or qualities by which they impress the mind, and are distinguishable from each other. Such words are called *Adjectives*, a term which signifies that class of words which *indicate any quality, property, or accident, of objects*.

When the mind has exerted its natural activity thus far, and has gained an acquaintance with objectivities and their qualities, another and further process of thought becomes necessary. Perceptivity has furnished the mind with ideas—has placed before it an account of his observations on the universe without and within, and presented to the intellective faculties the results of the operations of analysis, abstraction, and generalization. The primitive presentations which met the mind's eye in its earlier incursions into the domain of knowledge have been reduced to their elemental parts. Every single word has now become the sign of abstract thought—is the combined effluence of an impression on the mind, and an action of that mind upon that impression. When our notions of things *have been* so analyzed and decomposed that we have attained name-signs for each

specific objectivity, and each specific quality of objectivities, and our Words have become the symbols of separate and abstract ideas, we are able so to conjoin these abstraction-significant terms together, that each word shall lose its individual signification in the formation and conveyance of some idea of greater specialization; for "words do not communicate thought by their separate power and effect only, but infinitely more so by their connexion." Indeed, individual words are to our thoughts what letters are to words—mere elements—whose proper power and efficacy are only fully evidenced when employed connectedly. Thus the term *knowledge*, is the name-sign of one separate abstract idea; the word *power*, a symbolism for another special notion; the thought-sign is,* also possesses its own specific signification; but when all these three are colligated and conjoined, the special individual signification of each is partly lost to the view of the mind, and is merged in the more specific idea which is sought to be unfolded by the junction of the three terms, thus—"knowledge is power." That part of speech which thus re-synthetises ideas by the appropriate colligation of their symbols, and thus expresses the simple act of judgment, is denominated the *Verb*, and may be defined as that thought-sign whose principal use is to express the affirmations of the intellectual faculties—that word which denotes the energy of the mind, which connects two or more conceptions by an assertive or affirmational process. We have said "whose principal use is to express the affirmations of the intellectual faculties," because, that from the difficulty which the mentality experiences in reducing the concrete and synthetic notions which appear upon the stage of the mind, it has seldom succeeded in wholly disengaging and disjoining really separate and distinct ideas from each other, from which circumstance it happens that the verb, although in reality it derives its very birth from the assertive power, i. e., the judgment, is very frequently employed to co-express other and clearly different ideas, viz.:—

1st. An attribute or quality, as, I think = I am a *thinking* being.

2nd. A connexion between that quality and the objectivity to which it belongs, as, I think = *I* and *thinking* are conjunct, or *thinking* is a property belonging to *me*.

3rd. An assertion, either directly or indirectly, of the connexion which the judgment perceives.

There are besides several minor accidental properties, such as are technically denominated voice, mood, tense, number, person, &c., generally incorporated with the verb, but assertion is undoubtedly the generic connotation of the verb—that by which it is essentially distinguished from every other part of speech. The *Verb* is distinctly that term by which several special words are conjoined into one logical expression or compound WORD, and hence its name.

The three preceding classes of verbalisms may be regarded as the most necessary signs requisite for thought-expression. But the activity of the mind permits it no rest, and it "goes on refining," feeling new wants and supplying them, making a luxury even of language, by exerting its æsthetic powers to render language musical, harmonious, and melodious. Man begins to feel fatigued with repetition—sameness jars harshly on his ear; it observes that nouns, while they enable him to express his thoughts regarding objectivities,

* See "Art of Reasoning," vol. i. p. 142, First Edition.

do not possess the capacity of indicating the presence or absence of the object, and that their use frequently leads to periphrastic tediousness; hence his inventive powers are called into action to supply a sign which might fulfil the following pre-requisites, viz.:—

1st. Be a substitute, or that which stands *for* a noun.

2nd. Denote the presence or absence of the objectivity.

3rd. Indicate the *gender* of the objectivity.

4th. Distinguish the *person* of the objectivity.

All these ideas he has endeavoured to amalgamate in that class of words called *Pronouns*, or those words which stand as the representatives or substitutes of nouns.

As both adjectives and verbs are expressive of attributes or qualities, and as those qualities generally admit of modification, it is necessary to have a class of words adapted to express such modifications. The circumstances of an action, the place in which it occurred, the manner in which it was performed, the time at which it was begun or ended; the mutations and varieties of the qualities of objects, cannot be denoted with sufficient minuteness and accuracy by any modal change which it is possible to incorporate with any of the afore-mentioned classes of words; yet the circumstances of society, the happiness of man, the ultimate results of the most important negotiations of men and nations, or the most serious investigations of philosophers, frequently depend upon the accuracy or inaccuracy of the information conveyed regarding *time, place, manner, circumstance, or modification of quality*. The words which express these modifications are technically denominated *Adverbs*.

One important purpose of speech is to communicate information regarding the relations which the objectivities which surround us bear to each other. These relations are various, *e. g.*, instrumentality, causation, space, motion, time, accidental connexion and separation, procession, &c. Objectivities, as they are viewed in different lights, or for different purposes, occupy to the minds thus engaged in observation, certain relations in reference to each other, and these peculiar relationships depend upon the particular view taken of objectivities by the perceptive agency. The earlier notices of relation would be confined to sensible objects; but when men began to look, with the eye of consciousness, within, they would observe many analogies between the external world and the universe of mind, and would hence apply those terms metaphorically to the mind which they had previously employed only in the expression of relations perceptible in the sense-impressing world. All such words as express the relation which objectivities bear to each other are called *Prepositions*.

When, however, we have attained a clear conception of the relations of objects, we cannot long continue insensible to the fact that sentences, or thoughts, also have their relations, *e. g.*:—

1st. Simple or accidental connexion, as, and, both, &c.

2nd. Connexion of cause and effect, as, therefore, wherefore, that, hence, &c.

3rd. Connexion of effect and cause, as, because, for, since, &c.

4th. Simple or accidental contrariety, as, but, either, or, neither, nor, &c.

5th. Coincidence, or co-existence, as, although, likewise, also, as, so, though, yet, &c.

6th. Essential contrariety, as, unless, else, neither, nor, &c.

7th. Contingency, as, if, lest, &c.

It is of the utmost importance in discourse to be capable of conjoining the sentences in which our thoughts are expressed, in such a manner as shall exhibit the proper and mutual relations which these thoughts bear to each other; and hence the necessity of a class of symbols indicative of the connexion of thought with thought. This office is fulfilled by the *Conjunction*.

Man cannot become wholly an artificial being; remnants of his natural, or at least of his less cultivated, state still cling to him; and, under the influence of his passions and emotions, when his nature is excited to such a degree as to hold the intellect for a moment in abeyance, the natural ejaculations of pain, pleasure, surprise, &c., rise upon his lips. Such emotional or passionate signs hold no place in intellectual forms, and are, properly speaking, incognoscible by grammar or logic, although among the minor elements of Rhetoric they doubtlessly hold a place—1st, as the signs of being moved by certain feelings; 2nd, as conveying a sudden judgment in a brief, expressive, and emphatic manner; 3rd, to give a command, communicate a desire, or crave a benefit, in such a way as shall indicate the conjoint operation of the intellect and the emotions. They are, in general, however, merely thrust into sentences by the force of feeling, and do not modify, in any degree, the flow of the intellect in the expression of our ideas. Such *sounds*, therefore, as are significant of passion, and symptomatic of emotion, and hold no syntactical connexion with the other thought-symbols in a sentence, are denominated *Interjections*.

The following formula will, we hope, give a clear and comprehensive view of “the parts of speech,” and be serviceable to our readers as a “reference table” and a Mnemonic guide.

		Designation.	Definition.	Species.	Mode of Inflection.
Essential and Inflected.	1st. The Noun.	{	The name-sign of any existence, real or imaginary.	1st. Proper. 2nd. Common.	Number, Gender, and Case.
	2nd. The Pronoun.			real, ideal, collective, verbal, and abstract. 1st. Personal. 2nd. Relative. 3rd. Adjective.	
	3rd. The Adjective.	{	The name-sign of any quality, &c., of an existence.	1st. Proper. 2nd. Common. 3rd. Participial. 4th. Numeral.	Degrees of Comparison. Positive. Comparative. Superlative.
	4th. The Verb.			1st. Active-Transitive. 2nd. Active-Intransitive. 3rd. Passive. 4th. Neuter.	
		Designation.	Definition.	Species.	
Accessorial and Uninflected.	1st. The Adverb.	{	The name-sign of any modification of an attribute or assertion.	1st. Time; 2nd. Place; 3rd. Manner; 4th. Quality; 5th. Circumstance, &c. N.B. Some adverbs admit of inflexion by comparison.	
	2nd. The Preposition.			1st. Time; 2nd. Place; 3rd. Motion; 4th. Causation; 5th. Connexion; 6th. Separation; &c.	
	3rd. The Conjunction.	{	The name-sign of the relations by which sentences are connected.	1st. Connective. 2nd. Disjunctive.	Causative. Agreement. Contingency. Diversity. Alternation. Contingency.
	4th. The Interjection.			1st. Emotional. 2nd. Intellectual. 3rd. Mixedly Emotional and Intellectual.	

We subjoin an extract from Coleridge's Hymn in the Valley of Chamouni, in which the parts of speech are indicated by figures, in the following order—Noun, Adjective, Pronoun, Verb, Adverb, Preposition, Conjunction, and Interjection:—

4 3 * 1 4 * 2 1
Hast thou a charm to stay the morning star
6 3 2 1 7 2 3 4 4
In his steep course. So long he seems to pause
6 3 2 2 1 8 2 1
On thy bald awful head, () sovran Blanc!
* 1 7 1 6 3 1
The Arvé and Arveiron at thy base
4 5 7 3 2 1
Rave ceaselessly; but thou, most awful form!
4 6 6 3 2 1 6 1
Risest from forth thy silent sea of pine
5 5 6 3 7 6
How silently! Around thee and above
2 4 * 1 7 2 2 2
Deep is the air, and dark, substantial, black,
* 2 1 4 3 4 3
An ebony mass; methinks thou piercest it
5 7 * 1 7 5 3 4 5
As with a wedge! But when I look again
3 3 3 3 2 1 3 2 1
It is thine own calm home, thy crystal shrine
3 1 6 1
Thy habitation from eternity!
8 2 7 2 1 3 4 6 3
O dread and silent mount! I gaze upon thee,
5 3 5 2 6 * 2 1
Till thou, still present to the bodily sense,
4 6 3 1 2 6 1
Didst vanish from my thoughts; entranced in prayer
3 4 * 2 5
I worshipped the invisible alone.†

† "A" or "An," and "The," are usually denominated Articles, although, in our opinion, "An" is a numeral adjective, and "The" a demonstrative adjective pronoun.

Religion.

CAN CHRISTIANS, CONSISTENTLY WITH THEIR PRINCIPLES, REN- SUPPORT TO THE BRITISH STAGE?

AFFIRMATIVE ARTICLE.—I.

"Pictured morals charm the mind,
And through the eye correct the heart."

In our path through life, what a strange
contrariety of opinions spread themselves
out before us! What conflicts of ideas and
sentiments prevail around us! And how
often are we called upon to select from the

maze thus created, the path most like
lead us to right and sound conclusion
But comes there no good of this?
think we may answer in the affirmative
By the wholesome exercise of the reason
powers thus occasioned, we become
prepared for the great conflict of life. 2

over, whilst learning to respect the opinions of others, we become accustomed to form opinions of our own—and what is equally important, we hesitate not, when occasion requires, fearlessly to assert them. But we must change the scene of our musings.

The "British Stage" is the subject before us. What pleasing associations rush upon our memory ! What a long line of illustrious names presents itself to our mental gaze ! Among them men who have long since passed from the troubled stage of earthly existence, but whose lives were no less an honour to their calling than to their country. How forcibly we are reminded—

"There was a period when the stage
Was thought to dignify the age,
When learned men were seen to sit
Upon the benches of the pit ;
When to his art and nature true,
Garrick his various pictures drew,
While ev'ry passion, ev'ry thought,
He to perfection fully wrought—
By nature's self supremely taught."

And how the additional fact stands recorded before us, that—

"In those good times none went to see
The mere effects of scenery :
The constant laugh, the forced grimace,
The vile distortions of the face.
In those good times none went to see
Pierrots and clowns in comedy.
Men sat perfection to discern,
And learned critics went to learn."

But we must come still closer to the matter of inquiry, and before arriving at a conclusion, two previous questions present themselves for solution. First—What is the purpose of the stage ? Secondly—What are the principles of Christianity ?

The purpose of the stage we shall best understand by tracing it to its origin. What, then, do we find to have been the origin of the English drama ? Was it with a view to the promotion of vice and immorality that it took its rise ? We have no proof of it. Were its promoters men of base and depraved habits, possessing all the vices, and but few of the virtues, of mankind ? History fails to proclaim such a fact. Was it in its early tendency antagonistic to the spirit and purposes of Christianity ? We have been unable to discover any such record. What, then, does history say ? It says that the clergy were the first persons who in this country introduced dramatic

entertainments ; that cathedrals, monasteries, and not unfrequently parish churches, were selected for their performance ; that the representations they embodied were chiefly taken from the supernatural events recorded in the Old and New Testaments, and from the lives and histories of the saints. These facts are not recorded on doubtful authority, but are based upon the best historic proofs. Win. Fitz-Stephen, a monk of Canterbury, in a work written between the years 1170 and 1182, whilst contrasting England with various parts of the continent he had visited, says:—"London, instead of common interludes belonging to the theatre, has plays of a more holy character ; representations of those miracles which the holy confessors wrought, or of the sufferings wherein the glorious constancy of the martyrs did appear." We see nothing particularly unchristian about this, considering the age ! These "miracle-plays" continued for several centuries, accompanied by another description of entertainment, called "moralities," in which the senses, passions, affections, virtues, and vices, were personified, and constituted the characters. But these, too, were of a *moral turn*, and contrived to "entertain as well as instruct." Thus saith history.

We arrive, then, at this result, that the English drama originated in the attempts of the early ecclesiastics to impart religious and moral instruction to the people, and that this attractive form of instruction was selected upon the principle, that "pictured morals" do "charm the mind, and through the eye correct the heart."

Next, let us inquire, What are the principles and practical aims of *Christianity* ? We speak of Christianity here in its highest and purest sense, and as distinct from all sects and parties—these too often resulting in its misunderstanding or abuse. The true basis of all christian principles and precepts must be in the acknowledgment that man is an immortal but responsible being, endowed with the highest faculties, destined for the most noble ends, and formed for the enjoyment of the most perfect bliss ; but that the perfect attainment and enjoyment of all these is dependent upon the manner of his own life and actions. Hence he should cultivate virtue for its own sake, and abhor vice and all wrong-doing. The practical

aim of Christianity is to keep these truths constantly before the mind, and therefore a Christian could not consistently countenance anything which he believed to have a contrary effect.

So far we shall all probably agree. But having seen what are the objects of each, we have next to inquire, how far they are compatible with each other, whether there exists any harmony between them, or whether they are necessarily antagonistic. We say necessarily, because we prefer adhering to first principles when there is nothing implied to the contrary. If we view things in the position they come to assume when *abused*, we shall often err in judgment. The present question is one particularly liable to wrong construction unless the principles involved be kept steadily before us.

It may greatly simplify our position if we here look both at Christianity and at the stage in a *representative* form. Taking the *prophet* as the representative of Christianity, and the *poet* as the representative of the stage—which he clearly is,—how stand these personages in relation to each other? It is the mission of the prophet to bring mankind generally into closer communion with heaven; it is the mission of the poet to *prepare* mankind for such communion. Various methods may be and are employed. Can the stage fairly claim to be one of them? We assert that it can, and therefore that Christians can consistently render it their support.

Perhaps we can give no more correct definition of the instrumentality of the stage in this country for the purposes we claim for it, than when we say, its tendency is, and ever has been, "To show Virtue her own feature, Scorn her own image, and the very age and body of the time his form and pressure." Nor shall we err when we say that the result of such teachings must be

"To raise the genius and amend the heart."

We know of no method of instruction yet devised which embodies so largely the elements of success as dramatic representations. It has been truly and eloquently remarked, that what we *read*, often fails to produce a lasting impression upon the mind; what we *hear of*, finds no permanent abiding place in the memory; but that which we *SEE*, becomes

engraven upon the recollection—it survives all the vicissitudes and changes we may encounter, its image is ever at our call, and not unfrequently accompanies its possessor down to the last hours of his earthly sojourn. Many, no doubt, have in themselves observed this fact. Those who have not may apply a simple test. Let them take one of Shakespeare's plays—*Macbeth*, if they please; read it carefully until they *think* they understand it; afterwards let them see it acted by one of the masters of his art—for instance, as Macready would act it; and then apply the test. In the first case, he would have understood the character and the plot only in accordance with the narrow limits of his own conception. In the latter, he would see it as it presented itself to the imagination of the great bard, who, with his "eye in a fine frenzy rolling," distributed, through the point of his pen, that immortal genius with which the Great Author of our being had inspired him. Which impression, think ye, would be the more lasting?

It is not for us to trace the cause of this additional force of impression made through the medium of the eye. The fact exists, and has existed in all ages. The *action* thrown into dramatic performances has no doubt much to do with the impressions created. Cicero was evidently of this opinion, for he says, "It does not so much matter *what* an orator says, as *how* he says it." Horace also clearly made allusion to the known sympathy which good actors create with their auditors, for he says—

"With those who laugh our social joy appears,
With those who mourn we sympathize in tears
If you would have me weep, begin the strain,
Then I shall feel your sorrows, feel your pain."

We know that some of our argument may be probably used against us. It may be said, for instance, that that which is potent for good may, in the hands of evil and designing men, be made potent for evil. Such reasoners would eagerly remind us that they are not *all* lessons of virtue which are inculcated from the stage. That sometimes men whose virtues are few, compare with their vices, both represent and are represented. We cannot deny the fact. We have no particular desire to do so. For as well as to show "Virtue her own feature

it be also the object of the stage to shew "Satan her own image," how can she better than by the occasional introduction of characters whose lives most forcibly portray the necessary and certain results of wrongdoing? Besides, what do such objects say to the poetic declaration, that

"Vice is a monster of so frightful mien,
As to be hated needs but to be seen?"

The same power which can so successfully plead the cause of virtue, can with equal force depict the miseries which are the certain concomitants of long-practised vice. It is only a variation of means, leading to the same end.

It is always difficult to estimate with a thing like certainty the result of *indirect influence*. But we may at least judge their general tendency for good or for evil. We should hold it more than probable that the lessons so forcibly delivered from the stage—whether in doing honour to the good and great, the noble and the brave, or holding up to censure the profligate and debased—have struck home to many a heart which had remained unmoved under mild and perhaps more christian teachings. We have heard old men repeat with great enthusiasm the impressions produced upon them in their youth by witnessing the performance of the piece entitled *George Barnwell*, or another under the title of the *London Apprentices*, both of them exhibiting sound moral lessons, and especially adapted for young men starting in life.

But there is a class of persons who they assert, conscientiously object to the application of *fiction* for any purpose whatever, whether good or evil. Of such we would first inquire, what interpretation they put upon that portion of the script called "Parables," and then we would direct their attention to the true purpose of *fiction*, as thus described by poet:—

"True *fiction* hath in it a higher end
Than fact; it is the possible compared
With what is merely positive, and gives
To the conceptive soul an inner world,
A higher, surpler heaven than that wherein
The senses can themselves. In that bright
Are met the mental creatures of the men
Whose nature are with highest on the soul
Of man's triumphal arch."—*Pope*.

How many of the brightest human thoughts have been ushered into existence to serve the uses of fiction or minister to the poetic enjoyment of fancy? And are they to be deemed less valuable on this account? The drama is instructing our hearts, leads us into the far regions of heroism, and relieves us of our burden of mental depression:—

"Sweet airy spirits, that can heatow
Pleasuring respites to our woe,
That can corroding care beguile,
And make the woe-worn face to smile."

Whatever aspect we view the stage, it makes a large claim upon our sympathies, and it is with considerable satisfaction that we quote a modern author, who gives noble sanction to the feelings we entertain:— "The moral influence of dramatic representations on the manners of a people is far greater than may generally be supposed; and in opinion there is no class of persons more deserving of public esteem than those who are of histrionic performances, who sit in judgment on them, and conscientiously deliver their praise or censure. *Both dramatists and managers who endeavour to improve the character of the stage, cannot be highly commended or rewarded; while those who as ignobly study to gratify a depraved taste, are fit objects for the severest reprobation.*"

It will be observed that we have more particularly addressed ourselves to the origin and spirit of the British stage or drama, and to its present position. We do not shut our eyes to the fact that it is now in many respects far different from what we would like it to be. But we attribute this state of things to the almost entire neglect, or even contemptuous indifference, of those who should be its chief supporters and directors. A reaction commenced about the time of the Reformation, when puritanic zeal, or tantic pride, placed its iron barriers upon former pastimes and usages of the people, and caused even religion itself to assume the garb of sackcloth and ashes; it has continued thus, in some particulars, to the present day. We deem such austerity of manners as impolitic as it is absurd. It is directly contrary to the harmonising precepts of Christianity, and utterly opposed to the spirit of the age.

"Virtue, like the dew of heaven,
Upon the heart descends,
And draws its hidden sweetness out
The more as more it bends."

The stage is the mirror with which every age will reflect back its own "form and pressure," if only properly held. The reason of the stage being what it *now is*, instead of what it *should be*, is that those who ought to have directed it have neglected to do so; and, as a natural result, it has been seized upon by less scrupulous persons, and perverted from its original designs. Let the blame fall in the right quarter.

We contend that in principle the stage may be as consistently supported as it ever was. It has undergone no change by which it forfeits its former claims. "The very head and front of its offending hath this extent, no more"—it has suffered from neglect! When a better understanding of its use, and a more correct appreciation of its influence, become general, it will again rise and flourish in all its wonted splendour, saying unto man as it once said,

"Let all the ends thou aim'st at be thy country's,
Thy God's, and truth's."

C. W., Jun.

NEGATIVE ARTICLE.—I.

It seems that to secure the harmonious working of our nature, recreation is necessary—that the mind, jaded by the ceaseless round of daily toil, loses its elasticity unless relieved by amusement of some sort; gravity must, now and again, give place to light-someness. Among the various means of public pastime, the theatre occupies a prominent place. But as it is looked upon by many christian men with feelings of the strongest aversion, the question has arisen—Can they, consistently with their principles, render it their support? No opinion ever obtains the assent of any considerable body of intelligent men unless there is at least a substratum of truth in it. It would be somewhat anomalous if the hostility towards the stage, manifested by Christians of all denominations, were causeless. We shall endeavour to prove in this, and in a subsequent paper, that their aversion is well founded, and that their principles forbid that they should countenance even the British stage.

The stage is not a representation of society, as is frequently insisted. It has no counterpart, except in the mind of the author. From its nature it cannot be a representation, for on the stage that is set forth elaborately, openly, and offensively, which in society is done covertly. The workings of tragedy do not transpire till its completion, and hence none are demoralized; but in the theatre the plan is seen evolving, and the consummation of the crime is introduced to the beholder's view. The stage is, in this way, the abettor of crime; the plotting and *scheming* which in real life are unknown to

all save the criminal, are rendered quite familiar to the playgoer. We forbear to expatiate on this, though we discern in it the germ whence springs much of the criminality which afflicts society. In the theatre there is, on the part of the actresses, a wanton display of limbs and bosoms; this practice, it will be allowed, must have a disastrous influence on the minds and morals of spectators. Dr. Johnson stigmatizes it; his deliverance on the subject is to the effect, that although he felt pleasure in being present, he felt that in this respect dramatic representations were exceedingly dangerous. When a man of his moral calibre felt himself endangered by the lasciviousness of such displays, let no one fancy himself superior to their insidious influence. Let him recall to mind, that "the devil best fisheth for the souls of men when his hook is baited with a lovely limb." One may feel gratified, but the tendency of such exhibitions is to give an unhallowed stimulus to the imagination, which surely is at all times servid enough without such stimulus.

Whatever may be the element by which those who attend are attracted, one thing is certain, that the general audience do not present a fair specimen of the moral worth of society,—there is a preponderance of the inferior orders. We do not say that no religious persons attend the playhouse; but we do say, that the bulk of those who closely attend are persons of disreputable character; and from that we maintain, that as the Christian is commanded to avoid even the appearance of evil, he cannot, consistently with his principles, attend a place in which

he is brought into collision with men whose habits are diametrically the opposite of his, as by that his own is placed in jeopardy; and whether or not theatricals in themselves are bad, the fact that he there mixes with those from whom his habits may possibly sustain detriment, is sufficient of itself to deter him.

It is true that a chamberlain controls the literature of the stage; but when we recollect how much may be done by dress, by the modulations of the voice, the twinkling of the eye, and the motion of the hand, to give an unchaste turn to an expression or sentiment in itself faultless, little confidence need be placed in the guarantee which such an official can give for the morality of the stage when actors have the desire to transgress, and have an interest in transgressing. Evasion is easy to the ingenious caterer for public amusement; he may adhere to the letter of the authorized drama, and yet so travestie it by levity of manner as to reverse its original tendency. When we recollect the motives by which managers are actuated, and the irregularities of the players' lives, it will be seen how much is to be feared from this source. The rivalry between managers is not which shall produce such plays as shall lash public vices or elevate public morals, but which can produce such as shall attract "bumper houses," and secure them the largest returns. In this we do not cen-

sure managers; they merely look to their own interest, as other men do; their better judgment is kept in abeyance. We censure the stage, as it is open to be prostituted to the interests of managers; the evils resulting to the community from the interference of private interest are, in this case, of more than ordinary magnitude, and are, of course, the more to be deprecated. We are debarred from having that higher order of theatricals which might be beneficial; and so long as theatres are directly dependent on the public for support, so long must inferior theatricals prevail, for the few only can appreciate intellectual theatricals.

Meanwhile the British drama, including as it does the works of Wycherly, Congreve, Farquhar, and a variety of others of doubtful morality, cannot be homologated by the Christian; as he must witness the successes of high-handed ruffianism, set forward in the most alluring colours; as he must witness so much of craftiness and intriguing in the ascendant, so many painful exhibitions of human frailty flauntingly paraded, for the little that may be gathered, he cannot, he dare not, countenance it. Its tendency is to relax rather than to strengthen the moral nature: it is incapable of disciplining the heart, but potent to wean the mind from the momentous concerns of the life after life.

ARISTIDES.

Philosophy.

IS HOMŒOPATHY TRUE IN PRINCIPLE AND BENEFICIAL IN PRACTICE?

AFFIRMATIVE ARTICLE.—IV.

In a recent number of a popular publication,* a writer of manifest ability remarks—"The world would be spared a chaos of controversy and contention, difficulty and doubt, if those who profess to be students of natural science would but adhere to the seemingly easy and obvious rule of ascertaining facts before they adventure upon argu-

ment:" and then makes allusion to the predicament into which the "Merry Monarch" led the members of the Royal Society, by the question, "Why is it that a live salmon weighs more than a dead one?" The question was solemnly debated, and a multitude of astute reasons were adduced as accounting for the fact. It seems for a time never to have entered the learned heads to try the experiment; and when it was tried, it turned out to be a delusion altogether! The writer then proceeds to remark—"Even down to

* "The Critic: London Literary Journal"—reviewing a work by J. C. Colquhoun, Esq., "A History of Magic, Witchcraft, and Animal Magnetism."

our own day, men of science have persisted in *talking* when they should be *trying*, and in proving by unanswerable arguments that things which are *cannot be*, and those *must be* which are *not*. Obviously science is a question of fact. *It is useless to assail asserted facts by reasons for their non-existence. There is but one way of disproving them, and that is by trying the experiment. Nothing less than the experiment, carefully made by himself, will justify any man in denying the existence of a fact in nature which is asserted by some other man of equal ability and integrity.* Plain as this rule would appear to common sense, the history of science shows us that it is systematically neglected. Almost every science has been met with denials, founded upon some reasons why it *could not be*; and even honest and able men have continually so far forgotten themselves as to fight a new fact with argument instead of experiment.

"The writers do not say, as they should do, 'I have *tried* and find them to *fail*. I have put the asserted experiment to the proof, and it has *not* yielded the results.' But they say only, 'For the reasons following I assert that it *cannot be true*' Now, would it not be far more satisfactory if, instead of such an interminable form of discussion, those who *deny* the asserted fact would make a fair trial of it, not with instruments supplied to them by the other side, but in their own families, among their friends, their children, their servants, in circumstances in which collusion is impossible, and with persons whom they know to be incapable of imposture." Now we have put ourselves to the pains of making this rather lengthy extract with an especial object in view—it is, that having been consigned to everlasting oblivion by the overpowering diatribes of "Vinclum" and his clique, we wish, before taking a final farewell of this world and all its vanities, to follow the footsteps of the immortal Cobbett—who, as everybody knows, left a very enduring, and we may say well-merited, "legacy to parsons"—so far as to bequeath to the writers before referred to the said extract, together with all the moral lessons and sound reasoning therein contained, for their own especial use and benefit; and, in token of our sincerity, we set our hand—nervous though it be, by reason of our melancholy *late—to the foot or end of this our present*

paper, as will be seen when we thereunto arrive.

Having thus relieved our conscience, we feel better prepared to make the best use of the few moments still allotted to us. Assuming, then, that the same rule which applies to natural science also applies to medical science—namely, that its claims should not be met and refuted by mere assertion, but, if at all, by *experiment* and *proof*—how, then, stand our opponents with regard to ourselves? We, as supporters of the claims of Homœopathy, assert its theory to be sound—that there are numerous proofs to be adduced in support of the principle, *similia similibus*, several of which we have pointed out—that in practice Homœopathy has proved itself worthy of the claims made in its behalf, in proof of which "Irene" adduced statistics, in the last number of this magazine, which must sorely puzzle our opponents, and which, if they can, let them refute. How have these propositions been met? Do the anti-Homœopaths come forward and say, "We have, by cool and careful experiment, tried the principles you laid down, and find them erroneous?" Oh, no! Such a course would be far too simple and commonplace for such learned, and withal such self-confident, personages. Does the sun err in the performance of his daily mission? Does the moon depart from her accustomed track? Wherefore, then, should these profound reasoners err? Alas! for the vanity of human greatness! See how L. G. G. endeavours to impose a task upon us which he knows belongs to his party, and not to ours. Quoting the words of another, he says, "Let the Homœopaths select fifty healthful men, and in the use of fifty given medicines, let them produce in each of these fifty the separate malady of which that medicine is the professed cure; let this be done, and we shall at once believe that such medicines can cure the fifty individuals upon whom the said maladies have come from natural causes." Such a requirement is as contrary to all known rules of debate, as it is to common sense. We are content with our remedy. We put faith enough in it to try it; we are satisfied with the result, for we find benefit. What do we want more? It is for those who *do not* believe in it to adduce proofs of its fallacy. Let not L. G. G. think to find us tripping in this particular. We

a debate to be caught by such a staff.

the next species of "hocussing" been resorted to by our opposing that all mere arguments turn the fact that cures have been

Homœopathic treatment, they it certainly could not have been administered—it must have many regulations imposed which cure." What think you, reader, does it not sound like this?—"If deprive you of actual existence, east undermine and ruin your

Generous promptings of the t! But if our cures only came of the treatment imposed, why is faculty the common honesty in patients to adopt at least this "curative art"? Which are

—that our Homœopathic practice more honest than the haughty

Hippocrates and Galen, preferring to give their patients something new; or that they are more skilled, better knowledge of the human body therefore enabled at least to cure—by what means we need not say. The position assumed by our opponents is then open to either or both objections. This is a point we shall here answer. If dietary regulation a cure for one class of disorders, why not for another? It is at the patient wants, and he will not be likely to dispute about the means

to the present moment we had met the wrath which "Vinclum" sent us in his last paper was

sound and fury, signifying—nothing."

we wrong! Both our wit and our wits to "Vinclum" for giving us the possession of both) were at the time, and we confess it. How are we so blind as not to see that in our we struck the right nail upon

We felt, when we made allusion to a set of medical charges, that we were ourselves open to the accusation of blindness, and we were disposed to strike the offensive paragraph; but our wit or our wisdom (we won't say

which) prompted us to let it remain, and behold the confirmation it has received at the hands of "Vinclum"! After dismissing us with a few lashes, he turns, scourge in hand, upon that important personage, the PUBLIC, and hearken:—"We know, and the public know too—at least it ought to know, only [mind!] it shuts its eyes blindly to the fact—that under the old system, and too often under the improved state of things, medicine is sent and charged for which is not absolutely necessary." What think you, reader, of the fact thus boldly proclaimed, that the faculty DO plunder the public? "But," seriously adds "Vinclum," "can people grumble at a practice which they alone are instrumental in retaining?" Does "Vinclum" mean that people should patronize Homœopathy, and thus rid themselves of the old practitioners altogether? He does not say, therefore we may adopt what inference we please. But he further adds, "If they (the public) will not pay a medical man for his time, which is inestimably precious, for his health, which is equally so, and for an expensive education, can they complain if the fee which is so fairly due for professional advice, is grudgingly extorted by means of unprofessional bills for unnecessary items?" Thus speaketh "Vinclum;" need we say more upon the point? We were right, and "Vinclum" has proclaimed the fact to the world!

The position of the inquiry stands thus:—We assert that Homœopathy is sound in theory, and we adduce our reasons for arriving at such a conclusion. We assert that Homœopathy is beneficial in practice; we base this assertion on actual experience, and produce statistics in support of it. And until equal powerful testimony—that is, proof—be adduced to the contrary, we shall have no cause to alter our opinion.

There is one other point to which we wish to make a passing allusion. It is to the attempt made by one of the negative writers to cast a slur upon the character of Hahnemann, the original propounder of the Homœopathic theory. This is as mean as it is unjust. We have consulted several of the best authorities upon such matters, and find it admitted on all hands that he was decidedly talented. That he manifested his ability early in life, which led to his being placed to the study of medicine; that "he

gained a high reputation in the hospitals as a judicious and skilful practitioner;" and that, so far from wishing to build up his fame at the expense of his reputation, his fame was established before he advocated, or had even discovered, Homœopathy.

One word by way of conclusion. If it should so happen that we have found favour in the sight of any of our readers during the period we have had the pleasure of addressing them, it may be of interest to them to learn that, after having carefully noted our symptoms during the past few hours, we begin to have some hope for ourselves. We find—and we should wish to do the justice to state that we can only attribute the fact to the mirth we have enjoyed at the

expense of our energetic opponents—that after the old maxim of "laugh and grow fat," we do really fancy ourselves a little plumper, and a tinge of scarlet has even ventured to trespass again upon our worn cheeks, so that we may say we are in a fair way for doing well, even yet; and if a few days' quietude does not completely restore us, we shall have immediate recourse to our "pet cure," Homœopathy; should we derive no positive benefit therefrom, our only hope will be that we may suffer no more inconvenience from it than we have suffered from the "sluicing dose" administered to us by the "drug-and-bottle men," in whose favour we have made the bequest with which we commenced.

C. W., Jun.

NEGATIVE ARTICLE.—IV.

I HAVE frequently felt great satisfaction in reading the articles on the different subjects brought forward in your valuable journal. A journal has long been required, as a medium through which truth and error could meet on fair grounds, without the comment, the prejudice, and the bias of the editor, so that the gold may be separated from the dross, and that which is of great price from the worthless and pernicious. Such a medium is now to be found in the *British Controversialist*, where subjects are discussed on equal grounds—a boon unprecedented. A journal, thus started, I firmly believe, cannot fail to accomplish the objects for which it was born, and to be of incalculable benefit to that most important class of society—the young men. It is well calculated to transform the thoughtless, indifferent, and barren mind, into the thoughtful, intelligent, and fertile intellect; in fact, it will be one of the great and noble instruments in producing our future Peels, Russells, Disraelis and Cobdens; our Herschels and Rosses, our Lyalls and Bucklands, and our Humphrey Davys. But to the subject:—"Is Homœopathy true in principle and beneficial in practice?" I have read the affirmative articles, and have been exceedingly surprised to find how shallow they are of argument. They seem rather to have set up the barricade of sarcasm, so that they may escape being brought out to the test of true science. Whilst in the dark it will remain, and perhaps prosper, or rather have

an increased number of adherents; like the skeleton of man, if put under ground and covered with the earth, so that not a globule of air or moisture is allowed to touch it, whilst there in this dry condition, without a particle of light being permitted to beam upon it, will continue in the same form; but dig it up and bring it forth to the light, and it will crumble to dust. Just so with Homœopathy; as soon as its followers are unable to shrink behind some barrier, or keep back from the searching test of science, they must fall, a natural consequence. "*Similia similibus curantur*" is the basis of the whole system called Homœopathy; i.e., treat your patient by those remedies which are most calculated to produce the morbid state in which you find him.

Let us suppose a person attacked with hydrothorax, or water in the cavity of the chest, between the layers of the pleura. and that the cause of this disease was not from acute pleuritis, but from *great debility*. This is a well-known fact in medical science, that a constitution suffering from great debility produced by various circumstances, as impoverished blood from excessive depletion by any means, hard study, great anxiety, no air, cold, check of general secretion, neglect of health by irregular habits, and that there is a great tendency for the effusion of fluid in some cavity. What would Homœopathy do with such a patient? Surely he would deplete the patient still; perhaps he might feel inclined to advise the m

by which that state of debility was brought about, viz., what I have already mentioned. Is it not absurd on the very surface?—yet surely it is a fair deduction, and to me (according to their principles) appears to be the acme of treatment. I myself had the misfortune to be attacked by the disease I have described, and which was caused by debility. As soon as my condition was found out (for it crept upon the constitution very insidiously) all hope of my recovery had vanished; death seemed inevitable. How would my case have terminated, had I called in some disciple of Hahnemann?—the little hope, which every man is possessed of while he lasts, would certainly have been swept to the four winds of heaven: but I was *unwise* enough to call in one or two practitioners in legitimate medicine, and, to my surprise, I was soon enabled to watch and to experience the beneficial effects of those remedies which were judiciously administered—not under the like principle of “*similia similibus curantur*,” but my recovery is due to the opposite principle, a principle which is founded on scientific facts. Gratitude and joy flow forth from my soul to my fellow-medicals, who have thus by their skill, under a *true* principle, renovated my constitution. Nothing has more wedded me to the profession which I follow; and I shall consider myself honoured by still associating with men whose theory is borne out by true science, and who need not shrink (as our opponents have done) from the scrutinizing test of the scientific world.

Again. The Homœopaths profess to administer remedies in infinitesimal doses, and they state that, if applied in larger doses, the efficacy is lost. Now this is against all law, experience, and the common sense of man. I can imagine some Homœopath, being rather loquacious, called in to attend a very fidgety patient, who fancies she has all imaginable ills, and, at night-time, is honoured with ghosts, hobgoblins, &c., calming her spirit, and obtaining her faith, by these almost invisible globules, giving express directions with regard to *diet* and to out-door exercise, and assuring her, by all that is great and true, that her recovery will at once commence, and perfect health speedily follow. And so it may, there being nothing the matter, or no morbid condition but what *diet*, and *exercise*, and occupation of mind could eradicate; the latter being managed by her attention to the

novel, tasteless, and (forgive the expression) harmless globules. His name is spread abroad among all her friends, and she unhesitatingly declares that her life has been saved by those precious little spherules given to her by Mr. —, the Homœopath; and in the same breath declares, with the usual perseverance and zeal of her class, that the old system of medicine is murdering the people by hundreds, and even thousands. I happened to be brought in contact with a maiden lady, who occupied much of her time in praising Homœopathy to the skies, and in aiming her invectives against Allopathy. After a little conversation, I found that she suffered frequently from a periodical pain over her left eyebrow, which commenced in the morning as soon as she arose, and, by the beneficial tendency of the Homœopathic globules of china, the pain would depart about dusk; however, it used to return in the morning, and, by a few more china globules, would cease in the evening as before, and so on, continuing for a fortnight, three weeks, a month, or even longer. Now the merest tyro at the hospital would know at once the nature of her complaint—it was of the intermittent or ague type, which promises intermissions of alternate health.

A man of any knowledge and acumen could see through this absurd chicanery of the Homœopathic system, and *this* doubtless forms the basis by which the Homœopaths have raised their popularity. Such a basis must shortly dissolve, vanish, and “leave not a rack behind.”

The Homœopaths (for the want of something better to say) talk much about the conversion of medical men from the old to the new system. I have certainly heard of some medical practitioners, who possess *small* practices, and are not of very great note, considering it a good opportunity to become popular and busy, for the sake of the loaves and fishes, have (laying aside all integrity and principle) practised the new globular theory with great satisfaction to their purses. An instance of this I read a short time since. Some Homœopathic chemist sent a box of globules to Dr. Simpson, of Edinburgh, anonymously, who, on receiving them, gave them to his little boy to play with: the little child was in ecstasies with his new playthings; the globules attracted much attention, and caused great delight.

He would empty one bottle of globules and put them into another bottle, and so exchange places; afterwards he seemed desirous to know how many little balls he had, so he emptied every bottle, and put the globules together in a mass, and mixed them for some time, after which he filled each bottle with the mixed globules. About this time a medical man called on Dr. Simpson, and seeing this box of globules on the table, asked whether he might take them away? The reply being in the affirmative, he put them into his pocket, and left. Some time having elapsed, Dr. S. met this young medical practitioner, who told him that the box of globules he gave him had been of incalculable benefit, and in fact produced such a revolution as to cause him now to practise Homœopathy. Dr. S. smiled, but said nothing; but, meeting with him a short time after, told him the fact that his little boy had often played with them, and mixed them over and over again!

G. V. talks of *specifics*; the mere term brings up in my mind, with feelings the very reverse of admiration, the names of Holloway, Morison, Widow Welch, Parr, and a host of other quacks. Shall the educated and scientific medical practitioner be told to receive, as truth, that a certain remedy is a specific for a certain disease, irrespective of the cause and constitution of the patient? Has not the medical man, who examines his patient with a scientific eye, to obtain knowledge of the cause of the disease, of the constitution, temperament, idiosyncrasies, and many other conditions, before he is in a position to prescribe? And for an M.D. to talk of specifics for diseases, appears to me to be a perfect solecism, and the very essence of incongruity; he must either be entirely ignorant of the laws of medicine, or we must attribute it to dishonesty and hypocrisy. What are these globules composed of? I remember a young lady, who was rather in a mirthful mood, taking two of these globules for a dose, irrespective of remedy, and, to the great merriment of those around her, she was as well the next day as if she had taken nothing extraordinary—a great argument for the harmless

effect of these globules, and certainly bearing out G. V., where he says that “Homœopathy will in no case do positive injury.” In every view, and in every aspect, has the Homœopathic system the characteristic and prominent features of imposition. G. V. tells me something new, and I am no less astonished than “Vinclun” and L. G. G. to hear that “Homœopathy emancipates mankind from bodily ills.” This is startling! and certainly a blessing, if true. So we are likely to disappoint Cowper, who says—

“Man always is, but never to be blest,”

even while this world lasts, and that at a time not very distant, judging from the progress of this blessed system. The best thing the Homœopaths can do is, to organize and collect all their forces together in some of the golden regions, as the followers of Joe Smith have done. “Union is strength.” By inviting their converts to combine with them, doubtless before very long they would secure a perfect paradise on earth.

C. W., Jun., disapproves of the condemnation of new theories and systems; so do I, if they can be proved to be true. But new systems and theories are divided into two classes—1, Those which are true; and, 2, Those which are false: and it is my conscientious conviction that Homœopathy belongs to the latter class. C. W., Jun., appears to receive everything *new* as *true*; approving of Mesmerism, Phrenology, Hydropathy, &c.; and is, I presume, also a follower of Joe Smith. If the Homœopaths would allow me to suggest a president for their settlement, C. W., Jun., appears to be just the man; for he embraces all new theories, and consequently must be the most perfect man as yet found, ever progressing towards that state of perfectibility and goodness which he will doubtless very soon attain; for, being a Homœopath, the disciples of Hahnemann will emancipate his body from disease, and the followers of Joe Smith will give the correct tenets of the most recent—*ergo*, the true—religion.

Politics.

OUGHT THE JEWS TO BE ADMITTED TO PARLIAMENT?

AFFIRMATIVE REPLY.

It is, perhaps, one of the commonest causes of our misapprehensions and disagreements, that we are content to argue from contestable premisses, when a right principle is the true touchstone of the subject.

Our friend "Veritas," in assuming the spiritual element to be a necessary part of the British constitution, has given the use and consequence of first principles to mere notions which he must be aware are at issue with the views of a great body of the British people. They have a painful conviction that, sound and excellent as that constitution may be in its essentials, there are, nevertheless, defects and disfigurements which, having surrounded themselves with the halo of antiquity, and the respect which was due to the normal institution alone, are powerfully mischievous in their influence on the interests of society, and the progress of the human mind in its approach to truth. Were there no other proof of this, it would be sufficient to show how the "Church and State" idea, unlawfully incorporated by lust, power, chicanery, sincerity, in fact, by every species of motives and means, and by the same, both good and bad, perpetuated, till it had become a real part of the contour of the national system, has operated to the great detriment and distortion of justice, and also to the contracting of minds, otherwise sensible and capable of impartiality. In the present instance these results are seen—first, in the mind of "Veritas" finding its fundamentals in such simplicities as the following: "*monarch bound to be a Christian*"—"lords spiritual"—"commons originally obliged, not only to be Christians, but also to be communicants in the Church of England;" and then, in the ignoring of righteous claims, because they and the prior conception cannot tally.

May God forbid that Britain should ever be without national religion, and that the christian religion; be it still our bulwark and glory: but let us remember that the kingdom of God is within, not without; that

it is the adornment of the soul, and not the mere investings of the state; that it dwells in the highest and holiest of inward principles, and not in arrangements of parliaments; that there is really no religion at all if there be not individual religion, though you accommodate, in a wholesale way, Queen, lords, commons, and people with its name and reputation; and that it abhors, above all things, semblances, Pharisaisms, narrownesses, and unjust behaviour; and there will then be little fear that we shall cheat the Jew under the pretence that our "constitution" requires it, or our religion either.

If "Veritas" had based his reasoning on broad, immutable principles, had he taken his start but from even one natural truth, how great the advantage he had possessed. He could not be argumentatively strong upon anything short of it. He should have gone back, as W. G. says, to "the true principles of civil polity and government," and he would then, perhaps, not only have bettered his cause, but his arguments would have commanded careful consideration. As it is, viewing them as drawn altogether from a false source, we add nothing to what W. G. has said, save a simple denial of their applicability; but in bidding adieu to "Veritas," commend to a second reflection his favourite maxim, that "what is morally wrong cannot be politically right."

Passing on to the article of "Aristides," we readily acknowledge the general soundness of the propositions he has laid down in support of his views. A degree of identity in certain particulars is essential to the utility of any organization. There is this also to be observed in these positions and subsequent remarks of "Aristides," that they are free from that disposition to exclusiveness and unnatural jealousy which too frequently characterize the words and writings even of the most sincere of those who will not concede the claims of the Jew. Belonging to no class of intermediate, policy-spun accommodations, these come nearer the mark of

rationality and fairness; and if there really existed those differences, those oppositions of sentiment, interests, and sympathies between ourselves and the Jew to the extent which "Aristides" supposes, or, if good government, unity of purpose for the weal of a nation, were altogether dependent upon complete unity in sentiments, or interests, or sympathies, or in all of them combined, then might we fear the Jew, and, with some show of reason, suspect his right to our councils. But are not these differences greatly misapprehended, over-rated? "Descent:" equally distinct, as races, are the Celt and Saxon. "Faith:" equally adverse, if not more, must he who holds the christian faith, and the Atheist, who has no faith at all, be "Frequency of intercourse:" on 'Change, on the bench, on the rail, and in the mart is the Jew the daily companion of the Gentile; and if their social intercourse be not particularly familiar, equally unaccustomed are different grades of society to mingle their hearths and homes. "Similarity of interests." Has the Gentile an "interest" in the preservation of the state? Equally so has the Jew, for its fall could avail him nothing. He is prepared with no monarch to fill the vacated throne; his polity is a ruin; besides, according to "Aristides," his anticipated kingdom is elsewhere. Has the Gentile an "interest" in a flourishing state of commerce, healthy funds, national confidence, and contentment? So has the Jew, whose monetary "interests" are of equal magnitude, and equally at stake. Has the one an "interest" in the life of mutual obligations, and their due performance, in the activities of right precepts, and even in the common kindness and courtesies which go to make up the sum of happiness on earth; and has not he, the victim of the world's deridings and uncharitableness, an equal desire for the reciprocation of justice and manly kindnesses? And what amazing difference is there between the feelings and habits of the two? Their interests identical, so, variously modified by constitutional differences and circumstances, must their impressions, motives, and habits, be also identical. The difference between us, then, is not so alarming, after all. It is insufficient to justify a total subversion of moral duty. Then, again, necessary as may be identities in certain respects where a pur-

pose is contemplated, there are differences which are found to be no drawbacks in the attainment of the purpose, but are rather held to have a wholesome influence. All those we have been considering, differences of descent, antagonisms of faith and no faith, varieties of individual temperament and character, exist in our present parliaments, and the people of Britain are rather pleased than otherwise with the sundry nature of the composition, and think there are attendant advantages, while a portion of them have so high an opinion of this model of amalgamated contrarieties, that they would not alter it—not they, though all the virtues should entreat on behalf of a single Jew.

We trust that, in thus expressing ourselves, we are not actuated by the spirit of mere partisanship, or any unworthier motive than that which springs from conviction alone. We have considered the subject again and again, but cannot discover a distinction commensurate with the exception contended for. Why, we have all but made the Jew one of ourselves; there needs but a single clause to complete his charter of naturalization; and we hold that this much having been done, we have yielded the point of "peculiarity," and our "political difference" is peculiar in nothing but diminutiveness. If we err in making the last concession, we have greatly erred in our former liberality; but this view is not maintainable, because what we have done we have been compelled to do entirely by the force of rectitude, against the domination of our wary, hard prejudices, and Gentile haughtiness. And if we needed invitation to future duty, we have it clearly in the experience of the past, that, so far as we have shared with him the rights of citizenship, so far has the Jew been a worthy subject and servant of Queen Victoria. It will not do to shelve the remaining responsibility upon the plea of his slight patriotism with respect to his adopted country. This we take to be perfectly gratuitous. Based on such grounds duty would soon become indescribable confusion. Nay, "Aristides;" the Jew himself, by service already rendered, by interests co-extensive with your own, and by overtures of further devotion, protests against your assumption, and we dare not allow you the benefit of so convenient an excuse.

In conclusion, we remark, that whether or not there be truth in the popular apbhorism to which "Aristides" defers, it is undoubtedly true that suspiciousness and uncharitable accusations on the one side have a tendency to induce laxity of morals on the other. Only let a man know that you are inflexibly suspicious of his character and dealings, and he will be tempted to hold

lightly the virtue you will not give him credit for. If, then, the "wisdom" which "Aristides" venerates has its warrant in facts, we may well blush that they have been fostered by our direct encouragement.

Let us be just, and deal the final meed of justice to the Jew. Albeit, finite appearances, a just course, will assuredly lead to a right end.

B. W. P.

NEGATIVE REPLY.

THIS important question having been somewhat fully discussed on both sides, it becomes necessary to weigh the evidence adduced in order to arrive at a final and truthful conclusion on the subject.

The negative articles respectively published in the last three numbers of this periodical have, to a very considerable extent, effectually answered the arguments adduced in the affirmative; there are, however, several points remaining which require some little comment before the subject is closed. To these points we will now address ourselves; having done so, we shall leave the matter in the hands of the public and our readers generally.

It is stated by B. W. P., in his Article No. I., that "the christian oath which members take no more makes them Christians than do their christian names."

It cannot for a moment be supposed that any such absurd idea was or is entertained by the legislature. The oath was never used or intended as a means of conversion to Christianity, but as *the test of Christianity already in existence*. It may not be out of place here to refer to the test given by the apostles of old for the detection of the real spirit possessed by certain professed members of the christian church. It will be found, on reference to holy writ,* that the church is exhorted by the apostle John "not to believe every spirit, but to try the spirits;" and the means given for arriving at their real condition is, "Whether or not they would confess that Jesus Christ is come in the flesh." It is submitted that the test in question goes to the same point; and in order that the legislature may remain christian, it is necessary that such a test should be retained. It is argued that this test

is insufficient to keep out the infidel. Infidels should undoubtedly be rejected as much as Jews; but who, in the name of justice, has received authority to set himself up as a judge of the infidelity of certain members of parliament? Who dare presume to assert that, in a christian community, A. or B., because they may have done certain acts or used certain expressions which C. or D. could not conscientiously do or say as members of the same community, are therefore necessarily infidels? Their admission into the house is not obtained without passing through the required test and ordeal in some shape. It is therefore submitted that the oath having been subscribed and sworn to, or declaration made by such, the only legitimate presumption is, that they are Christians, and not infidels. It is not quite so easy for a member of the christian community to become an infidel, as some seem to imagine: though many, in the wickedness of their hearts, may desire to be and even boast that they are such, they themselves find a barrier which, in their consciences, they cannot overcome. We should therefore pause before we presumptuously and boldly assert that our senate-house is the receptacle of infidels. In the admission of the Jew, *as a Jew*, there might be some ground for such an assertion, for he not only openly and avowedly denies that Jesus is the Son of God, but also shrinks from the established test of the house.

It is also stated by B. W. P., that "Judaism and Christianity are identical in all that concerns the purposes of a government, that the rules which regulate the actions of them are the same in the Old Testament as in the New, and that the purpose of government is not the propagation of religion, but the enforcement of relative duties."

In remarking upon these several points, we will notice one started by W. G., in his

* 1 John iv. 1, 2, 3.

Article No. III., "That all arguments gathered from ecclesiastical connexions are worth nothing; that Cæsar and Cæsar's government have to do with man socially."

The remarks made by W. G. of our ignorance or wilful unmindfulness of the true principles of civil polity and government, we will cheerfully forgive, but would simply refer to a few facts which appear to have altogether escaped his observation. It must be admitted by all reflecting men that the era of this and every other christian nation (so long as she remains christian) must necessarily be dated from the establishment and adoption of Christianity alone. To revert back to Cæsar and Cæsar's government would be at once to destroy the christian contract, and return, in a national point of view, to paganism and infidelity. It must also be borne in mind, that the nation, in accepting Christianity, freely, voluntarily, and *of necessity*, gave up all rights which they possessed simply as men, or as a heathen nation, which were antagonistic to and could not be confirmed by Christianity, and in return received the boon of the gospel and discipline of Christ; it therefore appears to us perfectly idle to talk of rights of manhood amongst Christians irrespective of Christianity.

A short research of the scriptures will suffice to show the manifest difference between the rules for the regulation of man under the Old Testament and those under the New. We will only refer to one or two points, and leave the public to draw their own conclusion. For instance, under the Old Testament, the rule was and still is, "An eye for an eye, and a tooth for a tooth." A man who accidentally killed another might be slain by the deceased's relative (the avenger of blood), if overtaken by him before he reached a city of refuge. To say nothing of the restoration of beast for beast, the Jewish limitation of a sabbath day's journey, restrictions as to diet, and numerous others. How widely different are these from our rules, and how truly oppressive would such seem to us.

It is true that the purpose of government is not the propagation of religion, but the enforcement of relative duties. The law of Christianity may not, however, be lost sight of; indeed, our relative duties can be ascertained only by reference to it. The religion and constitution of the country must

alone decide what are our relative duties, and in what way they are to be enforced.

With reference to B. W. P.'s closing remark, that the question is finally settled, simply because London and Greenwich have returned Jews, we think he might with equal justice argue that the crucifixion of our Lord was a righteous act simply because the whole Jewish nation consented thereto.

We cannot help feeling that the remarks made by "Adelphos," in Affirmative Article No. II., and the motives ascribed by him to the lords spiritual and temporal, in throwing out the Jew Bill, from time to time, go too far. In the absence of the strongest possible evidence to the contrary, we are bound to believe they are actuated alone by principles and motives purely conscientious, from a desire to do their duty, and act consistently with the constitution of the country. However justified men may feel in these days in speaking and writing against this portion of our constitution, it cannot be denied that we are materially indebted to their superior wisdom; that their wisdom and discretion alone have saved this country, from time to time, from much misery and injury which would have resulted from the demands of an excited populace, had they not received the wholesome check which such a house can alone supply.

"Adelphos," like the rest of the Jews' advocates, appears to overlook the wide difference between a judicial and ministerial office; enough, however, has already been said on this head in the former articles.

Although, as stated by W. G. in Affirmative Article No. III., many Episcopalians may, and doubtless do, desire the separation of the church from the state, still it is submitted no conscientious Christian can wish, or can indeed contemplate, such a change, in order that the state should be (as it would seem the Jews' friends wish and others desire) sacrificed to the government of Cæsar, or, in other words, driven back to paganism and infidelity. Since, however, such a desire has so manifested itself amongst the Jews' advocates, and the anti-church-and-state portion of the community generally, it is submitted it would indeed be a direful event to remove from us at the present critical moment almost the only prop left to support the constitution upon its true foundation, and the government of the nation upon the princi-

of Christianity. Such a reversion would indeed place the Jew in a position above us, and possibly give to Rothschild and Salomons a power at present unknown to this nation, and make them like Josephs or Mordecais, for we should by that act dissolve our christian contract in a national point of view. In such a position of things it is easy to conceive how the democratic interests of our country would be interfered with. The grant to the Maynooth College has interfered with the rights and privileges of this Protestant nation. If the Romanists have sufficient power to obtain such a grant, why may not the Jew obtain infringements upon our rights and liberties in this and many other ways? It was not necessary that the Jews should be a large and powerful nation in order that the necks of the Egyptians should be bent to the rule of the Jew Joseph, nor is it necessary now in order that the like event should take place here.

If the Jew acts consistently with his faith (and his friends call him a consistent character), he has no hope in this or any other country but his own, and is looking forward to the coming of the Messiah to set up his kingdom, and re-establish him at Jerusalem; he is therefore, for this reason, also an unfit person to take part in the legislation of this or any other christian country, for want of the necessary sympathy with, and attachment to, the country, as wisely argued by "Aristides," in Negative Article No. III.

We cannot see how the rights of the people are interfered with (as W. G. would have us believe) by the refusal to admit the Jew into parliament, notwithstanding his election. We trust enough has been said to prove that we have no rights antagonistic to, or inconsistent with, Christianity; besides, as we have before stated in our Articles Nos. I. and II., the call of the people, as laid down by Blackstone, is to elect one *from amongst themselves*, which, in a christian community, cannot mean a Jew. No answer whatever to

this proposition has been offered throughout the discussion.

With reference to W. G.'s concluding remarks, we would submit that no length of residence can in the least strengthen the right of the Jew to interfere with, or take part in, the legislation of this or any other christian country amongst whom he may be cast, so long as he *remains in unbelief*. Nor do we think this country has anything to fear from his rejection, so long as she remains christian and he a Jew. If, however, the sacred bond be snapped asunder, and we, in a civil point of view, be driven back to Cæsar's government, there might perhaps be some ground for W. G.'s fears and apprehensions.

Having gone through, with some little care, the whole of the points raised upon this important subject, we are constrained to conclude that, for the reasons stated on the negative side throughout this discussion, it is not only both morally and politically wrong to admit the Jew, *as a Jew*, into our senate-house, but that such a step would be both highly inconsistent with, and dangerous to, the constitution and religious position of the nation; that the Jew himself (so long as he remains in unbelief) is unfit for such an office, and could not do justice therein, either towards us or himself. It therefore appears to us that he ought not to be admitted into Parliament until, at least, he has followed the example of "his friend at court," Disraeli, viz., embraced our faith, and tendered himself to the bar of the house as a Christian.

We also conclude, in order that the nation should maintain her exalted position in the social scale, and the free exercise of all her precious (but, of course, circumscribed) rights and liberties, it is essential that she should adhere closely to her religion and constitution, and most strenuously resist all attempts at innovation and infringements thereon, from whatever source they may come. With these few remarks we close our subject.

VERITAS.

A good reader is nearly as rare as a good writer. People bring their prejudices, whether friendly or adverse. They are lamp and spectacles lighting and magnifying the page. It is not enough for a reader to be unprejudiced. He must remember that a book is to be studied as a picture is hung. Not only must a bad light be avoided, but a good one obtained. This taste supplies. It puts a history, a tale or a poem, in a just point of view, and there examines the execution.—*Wilmott*.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—IV.

L. I., the writer on the affirmative of this question in the February number, proposes the query, "If the theory of Communism be so defective, how was it that the apostles were Communists, and exemplified their sentiments by forming the first christian church into a community?" We reply, that the primitive Christians adopted that manner of life, not from choice, but from prudential considerations, enforced by the times; they adopted it for the purpose of strengthening the bond of union, for readiness of conference on spiritual subjects, and for their mutual support under the persecutions to which they were subjected—persecutions which eventuated in the dispersion throughout Judea of that godly little brotherhood. Let it be distinctly recollected that that mode of life was not adopted till they were endangered by hostilities, and that, if we except two very small sections of the christian church—the Moravians and the Shakers—it has not since been revived.

The same writer founds his defence of Communism on the superior success of missionary enterprise under the conduct of the Moravians. That success is indisputable, but it is clearly owing to the influence of numbers, not to the espousal of Communism.

We look on Communism as a protest against the abuses of our social state, but not as a remedy for them—a protest which, in the ardency of youth, is subscribed to by every lover of his species: experience, however, brings with it a perception of the expediency, if not of the absolute rightness, of every institution, and usually checks the disposition to innovate on established in favour of ideal forms. Some men, nevertheless, retain the predilections of youth long beyond the period of juvenility, and, from a superabundance of philanthropy, urge the acceptance of Communism as the least complex and the readiest cure. Though we dissent from the opinions entertained by such persons relative to the practicability of Communism, we esteem them for the expression

of sympathy with that greatest of principles—universal brotherhood—which their theory implies.

The gist of the Communist system consists in the following particulars. The government is invested with all property; it is the recognised holder and administrator of all wealth; the members labour in common, and in return the produce of all labour is given to each according to his wants. Fourierism, Owenism, all the various forms of the idea, recognise this community of interest, labour, and enjoyment. The differences which entitle these systems to be considered as distinct are of minor importance in the present debate.

Society is a reflex of the inner man; insensibly, but invariably, men modify society into exact correspondence with their own nature; gradually, as their faculties become developed, institutions of an obstructive nature yield to others of a more liberal character. The changes in our institutions since chivalric times have been commensurate in extent to the period which has intervened: then the individual will of the baron was law to his vassals, but now feudality is obsolete. Society in its present organization is the result of this principle; yet, amid all changes, the institution of private property remains inviolate, and hence we conclude that it is agreeable to man's nature. Property represents the exertion of the individual, in furtherance of his material interests, in the same way as talent represents the labour undergone in the culture of the intellect. We look upon it as the outward manifestation of the individuality in man. Its acquisition not only stimulates to labour, but, when realized, is an amelioration of that labour.

We object to the proposed equality in the distribution of the produce; that equality is repulsive to our intuitive sense of justice, inasmuch as it supposes no discrimination of the ingenuity evinced in the different orders of labour, and supposes no recognition of individual merit. This, unless the tyranny of declarations of capacity be acted upon,

directly leads to the universal adoption of that sort of labour which requires the least exertion and the smallest amount of skill; for peculiar labours are never undertaken except in the hope of gaining peculiar rewards. Equality would thus, it is obvious, operate so as effectually to repress those generous impulses of soul, the achievements of which compensate for the evils resulting from competition, and confer a lustre on our social state to which it is impossible any other than a competitive state can pretend.

We object to the overwhelming power vested in the government. Philosophers are agreed that the love of power is a passion paramount in the human soul; proof of this is afforded in every phase of life, from the petty factory overseer to the ukase-promulgating autocrat. Now, from the almost boundless power centred in the magistracy, great temptations are presented to the assumption of despotic rule; it follows as a natural sequence that the magistracy would desire, for their own advantage, to perpetuate that power. Communism is a system which reposes such unlimited confidence in individual integrity, that every facility is at the command of any one daring enough to venture such an enterprise. As designing men will exist in a Communistic as well as in the present state, it cannot be supposed that Communism will enjoy an immunity from irruptions of this nature, when society, constituted as it is, and zealous as it is of such attempts, is still the subject of them.

How erroneous is the supposition that, in the community, crime would have no existence! We would not quarrel with Communists on this point, if they could as easily

exclude it from human nature; but, as that transcends mortal agency, it would not have been imprudent to introduce some provisions for its repression and punishment. Some do, indeed, propose to expel persons convicted of crime, should any such be found; but we should say there must be something defective in that state of society which would abandon, instead of generously endeavouring to reform, the misguided. Communism is fitted only for a state in which man has so effectually subdued himself, that restraints are rendered all but unnecessary.

But when, we may ask, is Communism to be adopted? Evidently the time has not yet arrived, for, on the failure of their experiments, the Communists urge in extenuation, that those with whom these experiments were made had previously had their natures perverted in our competitive state. Shall we, then, delay its realization till men have been elevated by education, and till the religious sentiment has taken vigorous possession of the soul? Need we say, that when that happy time shall have arrived, Communism will have ceased to be desirable, for our own social state will have been pruned of its abuses? The anarchy of interests pervading society is attributable to an insufficient evangelization of the popular heart and mind. Correct, exalt, sanctify these, and simultaneously society will be regenerated. Variety is essential to happiness, but Communism presents the uninviting prospect of one continued round of sameness.

This second series of objections is, we think, sufficiently cogent to warrant us in withholding our suffrage from Communism.

J. N.

AFFIRMATIVE ARTICLE.—IV.

Dr. JOHNSON remarks, "He that has no one to love or to confide in, has little to hope. He wants the radical principle of happiness." According to this statement, which we believe to be correct, "the radical principle" of man's happiness depends, in a secondary sense, upon at least one object worthy of man's love, and in whom he can confide with safety. If so, this principle and its benign effects will increase in proportion to the number and dignity of those objects which elicit, or rather which create, them.

Hence, to every honest and intelligent mind, but to such only, the term Communism involves the idea of a desirable state of things; for the noblest specimen of human greatness is a well-informed, God-fearing philanthropist. And what sight on earth can enhance the happiness of such a man's mind—comparable to that of brethren—Jew and Gentile, Greek and barbarian, Protestant and Catholic, Churchman and Dissenter, rich and poor, master and servant—dwelling together in unity? None: for such a scene would necessarily imply a cessation

of wholesale wickedness, and a total renovation of human nature and usages.

Communism, on a universal as well as limited scale, is not only desirable, but easily conceivable. By making an exertion of our imaginary powers, we can readily transfer ourselves into a state of society the members of which have all things common. Such a state of society does not necessarily imply an equalization of mind, wealth, wants, labour, and remuneration: but a willingness on the part of each of its members to contribute what he reasonably can for the benefit of the whole; and on the part of the whole to do all that is essential for the protection and support of every one of its constituent members. Were this the case, there would be, as Plato observes, no necessity for the words "mine and not thine;" for "there would be no contentions, nor lawsuits one with another, because none would have any thing proper to himself, except his own person: everything else would be common to all." A reciprocity of this kind would prove the bond of union—the safety valve—and the very life blood of Communism. Thus it is in the human body; here every member serves the whole, and the whole nourishes and serves each member, as and when necessary. There is a vast difference between the use and mechanism of the hand and those of the ear, but neither has a right to say to the other, "I have no need of thee;" nor has the whole any right to say to a part, "I can dispense with thee;" for the well-being of the whole is equally dependent upon each of its parts, and each part is dependent upon the whole. Without the hand human nature could not procure a subsistence; and without the organ of hearing, it would be the subject of endless inconveniences and jeopardies.

Here, then, we have what may be termed a perfect model of a Communistic state of society, a model in which Communism is epitomized. Without infringing the laws of analogical deductions, we may affirm that as it is in and among the members of the body, individually and aggregately, so we conceive it may be in the politic body. Though we called the human body in its healthful and perfect state a perfect model of Communism, we did not thereby wish it to be understood that the body itself was perfect. We look upon it as deficient in point of perfection,

not in mechanism but in physical education. But taking it as it is when in working order, we perceive in it the annexed features or facts which set forth the constituent elements of Communism:—1. A perfect whole—having nothing deficient, nothing redundant. 2. This whole is made up of a countless number of ingredients, parts, members, &c. 3. A power of renewing itself and maintaining its identity and aggregateness, notwithstanding the various omissions and losses to which it is constantly subject. 4. Precedency, dissimilarity, diversity, unison, sympathy, occasional refractoriness, &c., among its members. 5. Mutual and self-defence. 6. Everything essential to the health and well-being of the whole body. Now, by making a transfer of these and kindred principles to society at large, we have, hypothetically, the real Communistic state.

Again, Communism is not only desirable and conceivable, but attainable, that is, if we leave time present out of the question. But for sin, such an elysian state of things would undoubtedly have prevailed in our world throughout all ages; and though at this time unavoidably absent, it will ultimately be introduced successfully. The bitter waters of Marah are being sweetened by the cross of Christ. Christianity, the only patent Communistic leaven, is already in the meal—and ere long the whole lump of human nature will be leavened. The little stone of Daniel, which levels all before it, is now on the move. The germ of this better state of things made its appearance at the day of pentecost, and that appearance may be regarded as an earnest of what is in reversion for the future dispensation of man. And though at present we see but little of the Communistic principle, it is still in being, yet alive, and in the meal; and will, by-and-by, burst forth and shed its peace-giving influences among the nations. Lycurgus attempted to establish a system of fraternity in the Spartan republic, as appears from the following passage from his life, by Plutarch:—"Lycurgus persuaded the Spartans to make a new distribution of their lands equally among themselves; to live thenceforth as brethren together, so that none should seek to go before each other, save in virtue only: thinking there should be no difference or inequality among the

inhabitants of one city, but the reproaches of dishonesty and praise of virtue." Many French philosophers and others have made strenuous and praiseworthy efforts to found a Communistic state, in which there should be no individual or separate rights in property, and so forth: but hitherto all attempts have proved abortive. And here is the main reason, every proposed system has lacked a sufficient quantity of the principal ingredient—*religion*, the soul of the desired system. Moreover, the moral condition of man is not sufficiently pure and elevated as to admit of the most dignified system of Communism. The religion of the Bible, as couched in those ever-memorable words—"Thou shalt love the Lord thy God with all thy heart, and thy neighbour as thyself," is to Communism what life is to the body, or what God is to the world. In a preceding article on this question, the Moravians have been alluded to as having approximated nearer to a state of Communism than any other body of men. The fact is, they have a considerable share of this essential element among them. With them charity has its perfect work. Their happiness and progress are not to be attributed to Communism—but their Communism is to be attributed to their religion. Have courage to give tribute to whom tribute is due. Hitherto our remarks have assumed an affirmative phase, but they must now take a negative one as regards the question at issue, for we verily believe that Communism is at present impracticable. It is a subject of time; and as there is a time for everything, we shall undoubtedly have it in its time. We must

till and sow before we can expect to reap. By this we do not wish to either create or strengthen a religious and civil apathy, but to provoke our fellow-men to love and good works, by holding out to them the hope of a brighter, better, happier day.

To say that Communism is attainable and practicable in the present degenerate state of society, is tantamount to saying that an effect must exist prior to its cause, or even produce its cause, which in either case is absurd. For, in our humble opinion, Communism will be the effect rather than the cause of man's happiness, or at least it will be contemporary with it. At the same time it would seem that Communism will accelerate, augment, and help to perpetuate the happiness of men when once adopted by them.

But the means which will produce Communism will, at the same time, produce human happiness—and Communism will be but one of many effects resulting from those means.

The very thing that prevents the adoption of Communistic principles is the same with that which would wither their happy influences were they adopted in the present state of society. And this is the superabundance of sheer wickedness which infects our aggregate nature. And till this be extirpated and succeeded by something purely rational and divine, "there will always be a part, and always a very large part, of every community, that have no care but for themselves, and whose care for themselves reaches little farther than impatience of immediate pain, and eagerness for the nearest good."—*Dr. Johnson's Taxation no Tyranny*, p. 9.

The Societies' Section.

MENTAL SCIENCE.

We wish in this paper to recommend the study of Mental Science to all who are engaged in the education of the young, or who purpose to take part in this work. Perhaps it will not be too strong an assertion if we say, that multifarious as are the sciences with which an educator of youth should be intimately acquainted, there is none that more imperatively demands a persevering and careful study than this; and that other branches of knowledge should be considered as subordinate and auxiliary, commanded and directed

by this as central and paramount, as we see ridges of inferior elevation running parallel to a vast mountain chain.

The importance which we think proper to attach to the study of Mental Science stands, we are aware, in almost startling contrast with its all but universal neglect. While other subjects are pursued with a most praiseworthy vigour and perseverance, this is nearly unthought of, or, if thought of, deferred to some less active season. The claims of Grammar and Arithmetic, Geography and History, Euclid and Algebra, are so loud, that scarcely another voice can be heard: and so the student goes forth, and the teacher goes on, to prosecute his work in the dark, striking at random, often doing mischief he cannot avoid, and at the best gaining experience at the expense of his pupils.

The time will come, perhaps, when Mental Philosophy, as affording a knowledge of the material on which education has to operate, will be looked upon as an important part of the teacher's preparatory studies; but we urge its importance now, as indirectly and powerfully tending to success even in this point of view, but especially as altogether essential in the far more serious work of carrying on the education of a number of children. What would be said of a physician or surgeon who, with a good knowledge of other sciences indispensable to him, should have neglected to acquaint himself with the principles of physiology and anatomy? We should hesitate before we trusted life or limb to one who had so unaccountably omitted the chief part of his professional education. We should with reason expect him to know, not something only, but a good deal, of the machine whose disarrangement it is his business to remove or prevent. And shall it be thought a light thing, then, for one who is intended to educate the mind—to manage a machine a thousand times more intricate and difficult of control—to go forth to his task in blank ignorance of its nature and constitution?

Independently of the consideration of practical utility, there is, in the prosecution of any science, a pleasure, which forms the student's principal incentive and reward. Curiosity, "the thirst of the soul," is gratified and intensely delighted at the discovery of new truths: at the starting up of new relations unperceived before: and is set on tip-toe with eager excitement as it contemplates the long series of unexpected deductions stretching out before its view. Hence it is that Euclid is so fascinating a study,—dry indeed at first, and repulsive, but unfolding as the student advances a thousand charms which we could never have believed would evolve themselves from those few simple intuitive truths on which it rests. What a noble stream of thought flows from that meagre fountain! The student is constantly surprised with startling deductions; arguments and discoveries of new relations follow one another at times like peals of thunder, and one is hurried on impetuously to the result. For this reason Euclid is always a new book,—one of the few new books in the world; you constantly turn with pleasure to him, though for the thousandth time; the delight you receive from him is a rich reward for any labour you may have taken in your first studies.

So it is with the physical sciences. Without thinking at all of any purpose the stars may serve to the seaman, we behold with solemn gratification the hosts which are "the poetry of heaven." Their distances, their magnitudes, their motions; these very words when uttered with respect to the heavenly bodies, instantly fill the mind and set imagination on the stretch to span their meaning. So the other departments of natural science, a

those which relate to the structure of the earth, the nature of plants, or the habits and constitution of animals—all form a never-failing source of pure delight. That man has more to be thankful for, than if the wealth of Croesus were his own, whose mind can luxuriate in pleasures like these; who can sit down, in however humble an abode, and can summon knowledge to spread before him an intellectual feast, with which the intensest of sensual delights deserve no comparison.

Now, cannot pleasure of as pure a kind and of equal intensity be derived from the study of Mental Science? The world around us is rich in various objects of lofty and refined contemplation; is there not a world within teeming with greater wonders? Turn your thoughts within; you will find marvellous phenomena there. Think of Memory, Imagination, the Power with which you control your thoughts, dismissing them and recalling them at pleasure. Think of that mysterious faculty of Abstraction which the mind possesses; and ask if it is really to this power, visibly working early in childhood, that all the inventions of life owe their origin? Make your mind the subject of a little study;—you will soon find it a palace of enchantment; a universe of wonders, an entire marvel. When you sit down to this sort of study; when you introvert your thoughts, and consider the mysteries of your own spirit, you will see what Young meant when he said

“I tremble at myself
And in myself am lost.”

Moreover, by carefully and habitually observing the phenomena of your mind, you may derive interesting information from the most trivial occurrences that affect it; even castle-building may contribute its fraction of benefit, and the mad phantasies of the night may show that

“Dull sleep instructs, nor sport vain dreams in vain.”

It is an interesting occupation of the mind, while engaged in the study of the natural sciences, to mark the evidence of design exhibited each step we take. We find the construction of animals adapted peculiarly to their mode of living; and when this construction is not thus adapted, it is curious to observe, in numerous instances, how the defect is remedied. Now the evidences of skilful contrivance are no less manifest in the mind than in the external creation. We say the Judgment compares two ideas, i.e., sees whether they are alike or unlike, and whether they belong or do not belong one to another. The Judgment could not do this if Memory were not to recall these ideas for the purpose. Memory not only does this, but when conclusions have been arrived at by the Judgment, she takes charge of these also; and is able to present them to the Reason, who compares these several conclusions and deduces another from them. But simply recalling ideas, or the conclusions arrived at by the comparisons of the Judgment, is not enough; they must be kept before the mind for a time that the Judgment or the Reason may have a due opportunity of considering them. The power of so keeping these ideas fixed before the mind is that remarkable one called Attention. The power of Attention is the greatest faculty of the human mind, and the possession of it in different degrees by different individuals is the chief cause of the immense superiority of some minds over others. A prompt, retentive memory; a clear judgment; strong reason, are to a great extent attributes of a vigorous Attention. To attend is the most difficult operation of the mind, and it may be doubtful

whether it be not impossible without the signs supplied by language. It is a curious fact, too, that Curiosity should have such a tendency to quicken attention; and it is precisely in these circumstances that Curiosity is most alive. And it is observable also that this Curiosity is generally in proportion to our ignorance. The curiosity of a child in his first or second year is constantly on the alert;—a rude piece of wood, or a pebble, he turns over and over, receiving an accession of ideas at every turn;—hence probably a child in his earlier years makes greater advances in knowledge than he will ever make in any equal period of time afterwards.

As it is our purpose merely to direct attention to this branch of human knowledge, we will pursue the subject at present no further; but conclude with one or two observations. In regard to the study of this science, which, let it be remarked, may be pursued like the other sciences in accordance with the rules of sound induction—there will not only be felt the pleasure to which we have referred, but great profit will be derived in two ways:—First to the teacher, considered as being himself a learner. No teacher will succeed in his profession who is not a persevering student; and surely an acquaintance with the principles of Mental Philosophy, joined to a careful observation of the workings of his own mind, cannot but elicit useful practical rules for his guidance as a student. For instance, what we have just said about Attention, may lead him to consider whether in his studies it may not sometimes happen that the greater haste is the worst speed; and that *Sat cito, si sat bene* may be as apt a motto in study as on the panel of the Quaker's carriage. Secondly, it will prove of great benefit to the teacher in conducting the education of his children. We shall not dwell on this point, but take it for granted that a man should have some knowledge of that which has to be the subject of his daily and hourly training. "Education," says Dugald Stewart, "would be more systematic and enlightened, if the powers and faculties on which it operates were more scientifically examined and better understood."—*Papers for the Schoolmaster*.

ON SELF-DISCIPLINE.

THERE is always some danger of Self-discipline leading to Self-confidence: and the more so when the motives for it are of a poor and worldly character, or the results of it outward only, and superficial. But surely when a man has got the better of any bad habit or evil disposition, his sensations should not be those of exultation only; ought they not rather to be akin to the shuddering faintness with which he would survey a chasm that he had been guided to avoid, or with which he would recal to mind a dubious deadly struggle which has terminated in his favour? The sense of danger is never, perhaps, so fully apprehended, as when the danger has been overcome.

Self-discipline is grounded on Self-knowledge. A man may be led to resolve on some general course of Self-discipline by a faint glimpse of his moral degradation: let him not be contented with that small insight. His first step in Self-discipline should be to have something like an adequate idea of the disorder. The deeper he goes in this matter the better; he must try to probe his own nature thoroughly. Men often make use of what Self-knowledge they possess to frame for themselves skilful flattery, or to amuse themselves

in fancying what such persons as they are would do under imaginary circumstances. For flatteries and for fancies of this kind not much depth of Self-knowledge is required: but he who wants to understand his own nature for the purposes of Self-discipline, must strive to learn the whole truth about himself, and not to shrink from telling it to his own soul:—

“ To thine own self be true ;
And it must follow, as the night the day,
Thou canst not then be false to any man.”

The old courtier, Polonius, meant this for worldly wisdom; but it may be construed much more deeply.

Imagine the soul, then, thoroughly awake to its state of danger, and the whole energies of the man devoted to self-improvement. At this point there often arises a habit of introspection which is too limited in its nature; we scrutinize each action as if it were a thing by itself—independent and self-originating; and so our scrutiny does less good, perhaps, than might be expected from the pain it gives and the resolution it requires. Any truthful examination into our actions must be good: but we ought not to be satisfied with it until it becomes both searching and progressive. Its aim should be not only to investigate instances, but to discover principles.

Infinite toil would not enable you to sweep away a mist; but, by ascending a little, you may often look over it altogether. So it is with our moral improvement: we wrestle fiercely with a vicious habit, which would have no hold upon us if we ascended into a higher moral atmosphere.

As I have heard suggested, it is by adding to our good purposes, and nourishing the affections which are rightly placed, that we shall best be able to combat the bad ones. By adopting such a course you will not have yielded to your enemy, but will have gone, in all humility, to form new alliances; you will then resist an evil habit with the strength which you have gained in carrying out a good one. You will find, too, that when you set your heart upon the things that are worthy of it, the small selfish ends, which used to be so dear to it, will appear almost disgusting; you will wonder that they could have had such hold upon you.

In the same way, if you extend and deepen your sympathies, the prejudices which have hitherto clung obstinately to you will fall away: your former uncharitableness will seem absolutely distasteful; you will have brought home to it feelings and opinions with which it cannot live.

Man, a creature of twofold nature, body and soul, should have both parts of that nature engaged in any matter in which he is concerned: spirit and form must both enter into it. It is idol-worship to substitute the form for the spirit; but it is a vain philosophy which seeks to dispense with form. All this applies to Self-discipline.

See how most persons love to connect some outward circumstance with their good resolutions; they resolve on commencing the new year with a surrender of this bad habit; they will alter their conduct as soon as they are at such a place. The mind thus shows its feebleness: but we must not conclude that the support it naturally seeks is useless. At the same time that we are to turn our chief attention to the attainment of right principles, we cannot safely neglect any assistance which may strengthen us in contending against

bad habits: far is it from the spirit of true humility to look down upon such assistance. Who would not be glad to have the ring of eastern story, which should remind the wearer by its change of colour of his want of shame? Still these auxiliaries partake of a mechanical nature: we must not expect more from them than they can give: they may serve as aids to memory; they may form landmarks, as it were, of our progress; but they cannot, of themselves, maintain that progress.

It is in a similar spirit that we should treat what may be called prudential considerations. We may listen to the suggestions of prudence, and find them an aid to self-discipline; but we should never rest upon them. While we do not fail to make the due use of them, we must never forget that they do not go to the root of the matter. Prudence may enable a man to conquer the world, but not to rule his own heart: it may change one evil passion for another, but it is not a thing of potency enough to make a man change his nature.—*Essays Written in the Intervals of Business.*

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Birmingham Debating Society.—An interesting public meeting of the members and friends of this society was held on Friday evening, February 20th, at the Philosophical Institution, Cannon-street. Mr. Williams presided, and the attendance of ladies and gentlemen was numerous and highly respectable. The subject for discussion was, "Whether it is probable that the other European States will suffer from Russian Aggression." Dr. Heslop opened in the affirmative, contending that the past history of Russia, her aggressive policy, not only at remote but recent periods, her present desire for additional territory; the immensity of her empire; amount of population; strength and condition of her army and navy; the advances she had made in manufactures of every kind, and other remarkable features connected with that important country, warranted the belief that at no distant period the states of Europe would suffer by aggressions from her of a most serious character. The army of Russia numbered upwards of 700,000; her naval force consisted of about forty-five ships of the line and thirty frigates; her population was increasing much faster than that of France; her manufactures were rapidly extending; and on the whole she occupied in every respect a most important position in Europe.—J. T. Chance, Esq., replied to the remarks of Dr. Heslop, and expressed his opinion that there need be no apprehension of future aggression on the part of Russia. In the first place, the territory which she had taken was not so large as was imagined, it seemed but a speck upon the map; and even though she were disposed to add to her present almost unwieldy dominions, she did not possess the means to enable her to do so. Her revenue was limited; and, in proof, he would mention the fact that after the assistance she rendered to Austria in 1810, she was compelled to replenish her coffers by effecting a loan of upwards of five millions. The extent of her country, too, was an obstacle, and the trouble and cost of removing immense armies thousands of miles would be more than she could bear. Beyond England in Europe

they would not hear much of the aggression of Russia, nor was she styled perfidious; but they might hear a good deal about perfidious Albion, and her aggressive policy in the East. It had been said with truth that Russia had taken to herself important places from other countries, but the extension of her trade required them. She required outlets for her manufactures, and for the achievement of that object obstacles should be removed. If the mouth of the Thames were claimed and occupied by some foreign power to the injury of this country, would not England make an effort to obtain possession of it? The population of Russia might be increasing more rapidly than that of France, but it should be remembered that Russia contained a greater number of inhabitants than France, and consequently her population increased in proportion. He contended that the increase of commerce in Russia would act as a preventive against aggression, for it was not likely that, depending a good deal upon surrounding states for her trade, and hoping to still further extend it, she would risk it by acts of aggression.—Mr. Jabet, in proving the aggressive policy of Russia, related her acts for the past eighty years, and expressed his belief that she would ere long still further extend her territory. She had no proper boundaries, and was divided from other states by imaginary lines, which it was probable she would attempt to remove, and extend her own empire.—Mr. J. T. Turner contended that the states by which Russia was surrounded were obstacles to encroachment. Sweden, with her brave army and navy; Prussia, with her civilization and increased facilities for warfare; and Poland, ever remembering the wrongs inflicted upon her, would check the destructive course of the Czar.—Mr. Saunders contended that there was every reason to apprehend aggression from Russia, and concluded by quoting Napoleon's remark at St. Helena, that in fifty years Europe would be Republican or Cossack. The hour being now far advanced, Mr. R. Wright moved the adjournment of the debate, which was seconded by Mr. W. B.

the fair sex; John Gerald Potter, Esq., was called to the chair, who said,—“In this country we can support societies like this without any fear that they will become political in their bearing or revolutionary in their tendency. These societies, although primarily intended to minister to the improvement of their members, are not necessarily confined to that object, but have within their scope the improvement of the world at large. There are people at the present day who speak of a little knowledge as a dangerous thing, and who regard these institutions as extremely dangerous and democratic in their character. But such is not my opinion, for I believe that they are conservative in their tendency and beneficial in their action; and believing so, I wish them prosperity.” The secretary, Mr. Ralph Walsh, then read the report, from which it appeared that the society originated with a few young men, who, having been called upon to speak in public meetings, found themselves unequal to the task, and, being desirous of gaining knowledge, and imparting the same to others, they resolved themselves into a society on the 1st of August, 1851. The society numbers about eighteen members, possesses a small library of its own, and takes in the *British Controversialist*, the *Working Man's Friend*, &c. During the evening the meeting was enlivened by speeches and recitations from the members. Thanks were given to the ladies for their attention

to the tea, and to the chairman, after which the meeting separated.

R. W.

Cheltenham Mutual Improvement Society.—This society was established November 20th, 1851, when a few individuals met and drew up a code of rules for its management, and elected a committee, secretary, and treasurer, from their number to act for the first half year. The object, as stated in one of the rules, is the “improvement of the mind in different branches of education and religion.” To attain this end the members meet weekly in the vestry of Salem Chapel, to hold discussions, read essays, or any other employment that is thought profitable. Its principles are entirely unsectarian. Since its commencement it has doubled the number of members, and a library of circulation has been lately established for their use. Among the subjects that have been discussed are the following:—“Is it right that Capital Punishment should be inflicted?” “Is the Sale of Books in Sunday Schools in accordance with the Word of God?” “Is Competition Injurious or Beneficial to the Community?” Several original essays have been read by the members. A very interesting and instructive lecture has been delivered by Mr. James Lang on Phrenology, and the same gentleman has promised to deliver another, on the “External and Internal Evidences of Christianity.” The *British Controversialist* is regularly taken in by the society.

H. W. L., Hon. Sec.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

89. Who were the Port-Royalists quoted in the article on Rhetoric, II.; and what were they celebrated for? I have often met with quotations from their writings, but as yet am unacquainted with the meaning of the “nomme de plume,” for such it appears to be.—S. G.

90. If any of your historical friends would inform me of a good and concise English history of chivalry, ditto of the crusades, and ditto of the British colonies, I should feel greatly obliged.

J. C. H.

91. Being desirous of studying the Welsh language, I should esteem it a great favour if some one of your correspondents would take the trouble to give me, through the medium of your excellent publication, some information as to what books are most suitable for commencing the study of that language, and where I am most likely to obtain them.—VIATOR.

92. In a missionary magazine I found the four undermentioned lines. As I have never been able to trace out their authorship, probably some of your correspondents can assist me:—

“An Austrian army, awfully arrayed,
Boldly by battery besieged Belgrade;
Cossack commanders cannonading come,
Dealing destruction, devastating doom.”

In the magazine these lines were given as an illustration of the kind of alliteration that exists in Arabic poetry.—DRUMWHANNAN.

93. Can any of your correspondents inform me

of any periodical devoted to the sole purpose of publishing sermons? Also, any commentary on the whole Bible, or parts of it, which, after affording explanation of the chapter, or passage quoted, refers for additional information by giving the names of authors who have treated of the subject at greater length? Likewise, any clerical assistant which has arranged a series of texts of scripture in the order of the different books, quoting the author who has written on each particular text?—DRUMWHANNAN.

94. Will any of your Scotch law student subscribers have the goodness to inform me what course of study is necessary to acquire a knowledge of the principles of conveyancing according to the law of Scotland? I am quite aware the inquiry, as applicable to English law, is already answered in your pages.—LEX.

95. If any of your readers would give me information on the art of transparent painting on glass, for the use of the magic lantern, they would oblige.—J. G.

96. Will any of your correspondents inform me what is required before a person can legally style himself an “actuary”?—C. L.

97. A. B. would be obliged by information as to how he can be admitted into one of the Manchester engineering firms, as learner of the trade, or art of practical engineering. Several circumstances prevent his being apprenticed. First, he is nineteen years of age. Second, he has not the “necessary pecuniary qualification” for existing a term of years independent of receiving some proportion of cash for labour. He, however, has

a general knowledge of the *theory* of mechanics and machinery, and is aware that *physical labour* is a chief requirement. This latter element he trusts to be able to supply, and bring of an inventive, constructive, or mechanical turn of mind, and of an active temperament, he would, doubtless, give satisfaction to his employer.

ANSWERS TO QUESTIONS.

72. *Music*—It is impossible for us to prescribe an exact remedy for J. A. There may be some defect either in the ear for, or right perception of, music. Or it may be owing to lack of dexterity of hand, which is a more usual barrier to progress than some are ready to admit. Your best, and as it appears to us, only remedy, is to consult some good master. Get him to attend you while you go through a few of your exercises, and he will most likely discover and put you in the way of remedying your defect. ZENO.

79. *Sermon in favour of Homœopathy*.—The sermon referred to was preached on behalf of the Homœopathic Hospital, by the Rev. — Averest, and was printed under the motto:—"Heal the sick, cleanse the leper, as you preach the gospel." "A Constant Reader" will find it referred to at considerable length in Dr. Cormack's speech at the anniversary meeting of the Provincial Medical and Surgical Association, held at Brighton last August, and reported in the journal of the same name for August 20th.—VINCLUM.

83. *The Amount of Gold in Circulation*.—In reply to the question as to "the probable amount of gold, in sovereigns and half sovereigns, at present in circulation throughout the United Kingdom of Great Britain and Ireland, irrespective of what may be held at the Bank of England," I beg to state that I have based my calculation on Sir Robert Peel's declaration in parliament some five years ago, when he declared that it was a very difficult question to answer correctly: yet by observation of the circulation, he came to the conclusion that it was from thirty to forty millions. I have, therefore, taken thirty-five millions, and have added to it the different yearly return of the Mint coinage, which makes about fifty millions. But I have bitterly blamed government for such a pitiful currency for our debled population, and in face of the infamous suppression of free coinage at the Royal Mint for the people, and withdrawing an hundred and fifty million of silver tender for an only forty shilling tender, the worst robbery that was ever perpetrated since the creation.

I have given in *their favour* in all my late publications the other five millions, and state it now as fifty-five millions, and we have only twenty-one millions of silver:—seventy-six millions for twenty-nine millions of people—or two pounds twelve shilling and sixpence per head; whereas in 1815 we had, for seventeen millions of people, a £200 joint—one-fourth gold and three-fourths silver—currency, besides Bank of England paper—or eleven pounds fifteen shillings per head. This gave two hundred millions to pay for two hundred millions yearly original labour—so both balanced, pound for pound, in just equilibrium; but the day on which the above transaction took place, under Peel's abominable bill of 1819, three-fourths of the standard measure quan-

tity were taken away, and the poor man has given four days' labour for one day of his former just pay.—E. TAUNTON.

84. *Ventriloquism*.—We cannot tell you if there be any separate treatises published on this subject—we have never seen or heard of any, and have been pretty much among books for some years. We can offer you the following information on the subject:—Ventriloquism (literally, "belly-speaking," from *venter*, the belly; and *logos*, I speak) is a vocal mimicry of sounds, by which an illusion is produced on the hearer, who supposes that the sound comes, not from the mimic, but from some other person. It is, then, the art or practice of speaking, by means of which the voice appears to proceed from different places, though the utterer does not change his place, and in many instances does not appear to speak. It has been considered that the sounds were produced independent of the labial and lingual organs, and was supposed to be a natural peculiarity, because few persons have learned it by being taught; but it is certain that practice only is necessary to carry this act of illusion to a high degree of perfection; and that the sound is not produced during inspiration, but proceeds as usual during respiration, with a less opened mouth. The art of the ventriloquist consists merely in this:—after drawing a long breath, he breathes it out slowly and gradually, dexterously dividing the air and diminishing the sound of the voice by the muscles of the larynx and the palate, moving the lips as little as possible. The "National Cyclopædia" furnishes this additional illustration:—The essence of ventriloquy consists in creating illusions as to the distance and direction whence a sound has travelled, which are thus explained:—1. *Distance*. We do not hear the distance which a sound has travelled from its source, but we judge the distance from our former experience, by comparing the loudness which we hear with the known distance and known loudness of similar sounds heard on former occasions. Near sounds are louder than distant ones. Now, by preserving the same pitch, quality, and duration, but with an accurately graduated reduction of loudness, a series forming a perspective (if the term be allowed) of sounds may be created, which, falling in succession on the ear, will suggest to the mind a constantly increasing distance of the sound's source. In this way Mr. Love (we do not think him the best modern representative of his art) produces an imitation of a receding watchman crying the hour, so perfect as to appear a reality. An effort of a similar character, but in which the source of sound is approaching, is produced at the theatre in the representation of *Macbeth*. A military band is faintly heard, which gradually increases in loudness, suggesting to the mind the approach from a great distance of the victorious army of *Macbeth*, until the ordinary degree of loudness suggests its proximity, when the army immediately comes upon the stage. The estimate, then, which is formed of the distance which a sound has travelled before reaching the ear, is a judgment of the mind formed by comparing a present perception (by hearing) with the remembrance of a former loudness in connexion with its known distance. 2. *Direction*. The direction whence a sound comes seems to be judged of by the right or left ear receiving the stronger impression, which, however, can only

take place when the sound's source is in a plane, or nearly so, with a line passing through both ears. It is familiarly known that a person in a house cannot, by the noise of an approaching carriage, judge with certainty whether it is coming from the right or left. He accurately judges it to be approaching, passing, or receding, as the case may be, by the gradations of loudness, but is unable to decide with certainty whether its approach or recession is from up or down the street. Common experience shows the judgment to be more fallible concerning the direction than the distance of sound. The actor generally, by some look or gesture, directs the attention of his auditors to the direction from whence he wishes the sound to appear to proceed. This materially aids the delusion. Finally, it is quite as easy to speak without moving the jaw, and it is the jaw's movements which disturb the features in utterance. The labial sounds, as B, P, M, when the jaw is thus fixed, can be made with a slight movement of the lips. The lips and jaws being always somewhat open during ventriloquy, a slight labial movement remains unnoticed unless special attention be directed to it, and all the modifications of voice can be produced without at all distorting the features or moving the lips.

C. W., Jun.

The art of ventriloquism has been enshrouded in such mystery, that the opinion of the public has been for many years that this wonderful faculty, as they imagine it to be, depends upon some peculiarity of organization on the part of him possessing it; and the deceptions with which some of its clever practitioners have astonished the public have been so startling, and apparently wonderful, that it is hardly to be wondered that such an opinion should have so long and universally prevailed; and they, knowing full well John Bull's love for the marvellous, always endeavour to impress upon their audience that it is an intuitive power, and cannot be taught: but let me tell your correspondent, that so far from being so, it *can* and *has* been taught. Monsieur Alexandre, whose name ranks high in the art, once essayed to come to England to teach the art of imitation, but was dissuaded from it by his friends, who told him that John Bull would sooner pay a shilling to hear one that pretended to speak with his belly, than one who taught the art of imitation. The art consists in producing sounds similar to what would be produced were there real persons in the place from which you wish your voice to proceed; *e. g.*, you wish your voice to sound as it were from a chimney, you produce a sound similar to what would be produced by a person in the chimney, and by your gestures complete the delusion. It would take too many of these pages to inform you how all those sounds from inanimate bodies are produced, such as the sawing and planing of wood, opening of ginger-bread, frying, &c. &c., but if you will inform me of your address through the medium of this work, I shall be happy to give you any information you may require. Adopt the 'Labor omnia vincit' principle, and in time you will become a ventriloquist. I do not know of any treatise on the subject, but I should think, as the art is almost exclusively in the hands of a few, it is their interest so to keep it.

A VENTRILQUIST.

Ed. Bloomfield's and Alford's Greek Testaments.—The question of "Fil" may be briefly

answered thus:—Mr. Alford's edition of the Greek Testament is by far the most elaborate that has yet appeared in this country, and, as the Edinburgh reviewer predicts, may be fairly expected in time to take precedence of all others. But the nature of the discussions introduced into it, and the conclusions come to, although conviction of their truth is in most cases enforced by the most crushing logic, are yet such as to render it extremely inadvisable to commence the study of the Greek Testament under his guidance. There is much in his work that will perplex, much that will startle, the inexperienced student. For these reasons, the Edinburgh reviewer regrets that Mr. Alford did not write his commentary in Latin, "for all," he says (I quote from memory), "who are competent to appreciate his arguments, would be also competent to do so if clothed in that garb which transfers discussion from the pages of the weekly newspaper to the treatise of the matured theologian." The latter will here find points of great interest connected with the New Testament discussed with consummate ability, but the very depth of learning displayed will be likely to confound and perplex a novice unacquainted with the grounds of the arguments.

Mr. Bloomfield's work displays considerable diligence and skill in collecting and epitomizing the labours of others. For one just entering on his theological studies, it will be preferable to Alford's, to which it will serve very well as an introduction. To render it perfect, and worthy of the reputation it has earned, has been with Mr. Bloomfield the labour of a life-time. The notes are very extensive, sometimes perhaps too much so. The fact of its being dedicated to the primate is a sufficient guarantee for the *orthodoxy* of the views advocated. I will just mention two smaller editions of the Greek Testament which appear to me better adapted than Mr. Bloomfield's to serve as an introduction to Mr. Alford's work—viz., that by Dr. Burton, in which are copious references to most theological works which divines ought to possess; and Mr. Trollope's, the most valuable feature of which is the frequent reference to passages in classical authors, chiefly Homer, which illustrate customs, ceremonies, and institutions, alluded to in scripture.

JUNIOR SOPHISTES.

Your correspondent "Fil" (86), in your March number, makes some inquiries respecting Greek Testaments, especially as to the comparative merits of Rev. H. Alford's and Dr. Bloomfield's.

With the former I am unacquainted, even by name; but if his mode of interpretation be as your correspondent states, I should think him anything but a safe guide for a theological student, and would have "no fellowship with him."

Dr. Bloomfield I can unhesitatingly recommend. He has been long known as an accomplished Greek scholar, a translator of Thucydides, and compiler of the "Lexilogus Scholasticus," and "Epitome Evangelica." As a biblical, or rather as a New Testament, critic, he stands high. His "Recensio Synoptice, or Critical Digest of the most Important Annotations of the New Testament," in 8 vols. 8vo. published in 1826-28, is a most elaborate work, and of which his "Greek Testament, with copious English Notes, Critical, Philological, and Explanatory," in 2 vols. 8vo., may be considered as the *clitè*. Your correspondent may not be aware that a "Supplemental

Volume of Annotations" to his Greek Testament was published last year, and on its completion the learned author was presented at Court to her Majesty, by, I believe, the Archbishop of Canterbury. This is a proof of the orthodoxy of Dr. Bloomfield's theology. But I can, from my own knowledge, testify that the theological tenets of D. Bloomfield are sound, having for some time studied his "School and College Greek Testament," and his "Greek Lexicon to the New Testament." The price of the two latter works is 16s. 6d. each; that of the larger Greek Testament is £2: and the Supplemental Volume thereto is, I think, 13s.—all published by Longman and Co.

Valpy's Greek Testament, 3 vols. 8vo, price £15. (published by Bohn, Covent Garden, with English Notes, is thus spoken of by Dr. T. H. Horne, in his "Introduction to the Bible:"—"After a minute examination of this edition of the Greek Testament, I consider it the most valuable of any that has yet been published with critical and philological apparatus, especially for students who wish to purchase only one edition of the Greek Testament." This critique, however, was written before the publication of Dr. Bloomfield's Greek Testament. But if "Fil" could by chance see the last edition of Dr. Horne's "Introduction," published in 1846, "he would find that the notices of the critical editions of the Greek Testament, published since that time, are replete with interest to students." ALBUS.

We thank "Albus" for the above, but as he has not seen both the works to which "Fil" refers to, he cannot of course speak to their relative merits; we have therefore, under these circumstances, additional pleasure in drawing attention to the following remarks with which we have been favoured, by that eminent biblical critic, Dr. Davidson, of Lancashire Independent College:—

"No proper comparison can be instituted between the editions of the Greek Testament published by Bloomfield and Alford. The latter is infinitely superior. The texts of both, however, are bad. As to the notes, the deficiencies of both are of different kinds. While Alford's notes are not free from some rationalizing tendencies, the notes of Bloomfield are liable to the charge of other and heavier faults. But there is little doubt that Alford's will supersede Bloomfield's. The latter is greatly behind the state of knowledge; the other is up to recent researches. Alford is acute, Bloomfield blundering and dogmatic."

95. *English Composition*.—A really first-rate work on composition is still a desideratum. This arises from the fact that it is exceedingly difficult,

indeed, either to teach composition or to write a book on it systematically. To read good authors, and then reproduce them on paper, from memory, is the best and surest exercise. There is, however, a good book on "The Art of Composition," that deserves to be better known, written by G. F. Graham, the author of several excellent educational works.

J. B.

96. *Actuary*.—In answer to C. L., as to what qualification is necessary before a person may legally style himself an actuary, we are not aware of there being any qualification necessary beyond holding some post or following some employment, in which the duties come within the generally recognised meaning of actuaryship, such as keeping the accounts of some public company, or conducting calculations of an extensive character. The word "actuary" is from the Roman "*actuarius*;" and its earlier and more common meaning was "short-hand writer," although it was used in other senses, and applied to any person engaged in keeping the minutes of a public company. The most general sense in which the term is now used is to signify the *manager* of a joint-stock company under a board of directors, particularly of an insurance company, whence it has come to stand generally for a person skilled in the doctrine of life annuities and insurances, or in the habit of giving opinions upon cases of annuities, reversions and other contingencies. It properly, therefore, combines with the duties of secretary those of a scientific adviser to the board which gives him his office in all matters involving calculation, on which it may be supposed that the members of the board are not generally conversant, or competent to form an opinion for themselves. Since the passing of the Friendly Societies Act of 1819 (59 Geo. III. c. 126), the term has also had a *legal* signification: for by that act it is provided that no justice of the peace shall allow any tables, &c., to be adopted by any friendly society, unless the same shall have been approved of by "two persons, at least, known to be professional actuaries, or persons skilled in calculations." By 9 and 10 Vict. cap. 27, this power is limited to the actuary of the national debt office, or an actuary of not less than five years' standing to a public insurance company. With a view to raise the profession to a higher standing, an institution was formed in London some few years since, called the "Institute of Actuaries," to which only those known to be well qualified in their profession are admitted. The members of this body are distinguished by the addition of F. I. A. to their names—which, by the way, they do not often forget.

C. W., Jun.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XIV.

1. What is Figure?—give syllogistic examples of its varieties.
2. What is Mood?—how many Valid Moods are there?—and why are there only so many?

3. Construct Syllogisms in Bokardo, Bramantip, Camestres, Cesare, Camenes, Dimaris, Disamis, Darapti, Ferapo, and Felapton.

4. Evolve the seven rules of Syllogism from the Mnemonic Latin verse given in the text, or the translation, p. 204.

5. What are the rules of Figure?

6. Reduce the Syllogisms given in Exercise III. to their corresponding moods in Figure 1.
7. Give syllogistic illustrations of the accuracy of the Mnemonicism on Reduction, p. 207.
- N.B. The author of "The Art of Reasoning" regards this as a most important exercise, and recommends it to the careful attention of every pupil in the Logic Class, and the editors hope that corresponding attention will be bestowed upon it.

GRAMMAR CLASS.

Exercises in Grammar.—No. III.

1. Write out the plurals of the following nouns,

- arranging them in a form similar to that given below.
- Ally, abbey, calf, ass, man, child, foot, army, half, echo, wish, woman, attorney, aviary, knife, brother, goose, box, armadillo, caitiff, cliff, cargo, buffalo, beauty, life, loaf, pontiff, brief, coil, chimney, penny, tooth, pontiff, dish, grotto, folio, dwarf, fife, grief, sheaf, shelf, hoof, strife, puff, scoff, nuncio, punctilio, motto, portico, seraglio, banditto, potato, volcano, louse, ox, die, lease, focus, genus, genius, sow, hypothesis, dictum, index, penny, dogma, pea, seraph.
2. Show the difference in the application of each pair of the double plurals.
3. Supply six nouns which have no plural, and twelve which have no singular.

NOUNS.

FORMATION OF THE PLURAL.

By the addition of "s."	s, sh, ch (sounding tsh), x and o, adding "es."	y changed into "ies."	f, or fe, changed into ves.	Irregular.
			f, or fe, remaining regular.	
	Exceptions in "o."	y preceded by a vowel remaining regular.		Double plurals.

MATHEMATICAL CLASS.

SOLUTIONS.—II.

Arithmetic and Algebra.

- Question 5. $16 + 14 + 12 = 42$.
- As $42 : 126 :: 16 : 48 = 1\text{st Boy}$.
- $42 : 126 :: 14 : 42 = 2\text{nd Boy}$.
- $42 : 126 :: 12 : 36 = 3\text{rd Boy}$.

- Question 6. The cock No. 1 will fill the cistern in 6 hours, therefore in 1 hour it will fill $\frac{1}{6}$ part of the cistern; similarly, we see that No. 2 will fill $\frac{1}{4}$ of the cistern in 1 hour; therefore these 2 filling-cocks together will fill $\frac{1}{6} + \frac{1}{4} = \frac{5}{12}$ in 1 hour. The cock No. 3 will empty $\frac{1}{3}$ part of the cistern in 1 hour, and No. 4 will empty $\frac{1}{4}$ part; therefore, these two emptying cocks together will empty $\frac{1}{3} + \frac{1}{4} = \frac{7}{12}$ in 1 hour.
- Now $\frac{5}{12}$ and $\frac{7}{12}$ brought to a common denominator = $\frac{5}{12}$ and $\frac{7}{12}$; hence we see that the 2 emptying cocks are more powerful than the 2 filling ones, by $\frac{1}{12}$ of the whole cistern in an hour; and therefore, if the 4 cocks were all set open together, the EMPTY cistern would NEVER be filled; which is the answer to the question.
- If the cistern were full, and all the cocks set open, it would be emptied in 120 hours.
- C. D. S.
- This latter is the proper answer; see *Erratum*, p. 117.
- Question 7. $\frac{1}{2}$ of $\frac{2}{3}$ of $\frac{3}{4} = \frac{1}{4}$ = friend's share in the ship.
- Value of $\frac{1}{4}$ before damage = $£1093\ 15s$.
- " " " " = $£1093\ 15s. \times 5 = £5468\ 15s$.

- But worth of ship after damage = $£35000 - £17000 = £18000$.
- \therefore Present value of $\frac{1}{5} = \frac{18000}{5} = £3600$.
- " " " " = $£3600 \times 5 = £18000$.
- \therefore Present value of share $£2812\ 10s.$, and extent of loss = $£5468\ 15s. - £2812\ 10s. = £2656\ 5s$.
- J. B.
- Question 8. $x + y = 18$ (1)
- $xy = 65$ (2)
- Sq. of 1st equation $x^2 + 2xy + y^2 = 324$
- Subtracting $4 \times (2)$ $4xy = 260$
- $x^2 - 2xy + y^2 = 64$
- Extracting sq. rt. $x - y = 8$ (3)
- But..... $x + y = 18$ (4)
- Then $x = 8 + y$
- And $x = 18 - y$
- $2y = 10$
- $y = 5\ \text{Ans.}$
- $x = 8 + 5 = 13\ \text{Ans.}$
- T. G.

Geometry.

- Question 3. $x = \sqrt{\frac{15^2}{3}} = 8.66, \&c$.

It is evident that in this case the centre of the sphere coincides with the centre of the cube, and that the greatest diagonal of the cube is the diameter of the sphere. But the square of this diagonal equals the sum of the squares of the length of one side of the cube, and the diagonal of another, and the square of this last diagonal equals twice the square of the side (Euc. b. 1, p. 47); therefore, the square of the first diagonal—that is, of the diameter of the sphere—is equal to three times the square of the side of the cube.

W.

Question 4. $10^2 - \left(\frac{10}{2}\right)^2 = 100 - 25 = \sqrt{75} = 8.66025 \times 5 = 43.30125 = \text{area of equilateral triangle.}$

And $43.30125 + 15$, half the sum of the sides = $58.8675 = \text{radius of inscribed circle, whence}$
 $58.8675^2 \times 3.1416 = 8.3333 = 26.1799 = \text{area of the same.}$

Also $\frac{10 \times 5}{8.66025} = \frac{50}{8.66025} = 5.7735 = \text{radius of circumscribed circle.}$

Whence $5.7735^2 \times 3.1416 = 33.3333 = 104.7199 = \text{area of ditto.}$ J. J.

Mechanics.

Question 3. It is ascertained that a dense or compact body, when falling freely, passes through a space of $16\frac{1}{2}$ feet during the first second. We find that the space fallen through in $7\frac{1}{2}$ seconds is determined by the following arithmetical computation, $7\frac{1}{2}^2$, or $7.5^2 \times 16\frac{1}{2} = 904$ feet $8\frac{1}{2}$ inches, the depth of the pit required. L. R.

Question 4. Since the velocity or rate at which a body would be falling at the end of any given time is equal to the time in seconds multiplied by $32\frac{1}{2}$ feet, we have $7 \times 32\frac{1}{2} = 225\frac{1}{2}$ feet = the rate at which the stone would be falling at the end of 7 seconds.

Again, since the momentum of a body is proportional to its velocity and quantity of matter, we have, firstly, $7\frac{1}{2} \times 32\frac{1}{2} = 241.25$ feet = velocity acquired by the stone at the bottom of the pit; and, secondly, $241.25 \times 1 \text{ cwt.} = 241.25 = 12$ tons $1 \text{ cwt. } 1 \text{ qr. } 0 \text{ lb.} = \text{the momentum of stone when it reached the bottom of the pit.}$

CYMBRO.

QUESTIONS FOR SOLUTION.—IV.

Arithmetic and Algebra.

13. Reduce $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}$, and $\frac{1}{6}$, to a common denominator, and explain the process.

14. If 30 men, in 164 days of 12 hours each, build a wall 700 feet long, 12 feet high, and 2 feet thick, how many men, in 70 days of 10 hours each, can build one 900 feet long, 8 feet high, and 18 inches thick?

15. On certain goods the duty amounts to £5740, out of this a discount of $2\frac{1}{2}$ per cent. is allowed on the sum actually paid, for prompt payment. What does the discount amount to?

16. Given $x + y = 20$, and $x^2 + y^2 = 232$, to find x and y ?

Geometry.

7. The diameter of a circle is 17. Required the side of an equilateral triangle constructed about it.

8. Two circles touch externally; their diameters are 12 and 20. Find the side and base of an isosceles triangle enclosing them.

9. The chord of an arc is 490 links, its height 8. Required the area of the circle of which it forms a part.

Mechanics.

7. A well is being sunk 40 feet deep, and 17 feet in diameter; a cubic foot of the material weighs 100 lbs. Find the units of work necessary to raise the whole to the surface.

8. In what time will a man raise the above with a windlass if he perform 2600 units of work per minute, and work 8 hours per day?

Notices of Books.

The Life of Edward Baines, late M.P. for Leeds.

By his son, Edward Baines, Author of the "History of the Cotton Manufacture." Longman and Co.

The consideration of history is not merely an interesting but it is an instructive occupation, when the knowledge thus gained of the past is with wisdom applied to the present, or with prudence stored up for the future. Human nature has been the same in all ages of the world, and has developed the same properties on every habitable spot. Society may have changed its aspect, and individuals their habits, but man is the same; the same high duties rest upon him, the same menacing dangers beset him, and the same glorious destiny is placed before him. If, then, we read the historic scroll aright, we may trace, not only the course which communities have taken, but the path in which men should tread. If these remarks apply to general history, with much greater force do they to that particular portion of it termed "Biography," or the history of individuals. The former is occupied, for the most part, in recording the acts of tyrannical sovereigns, or the plots of ambitious subjects, while the latter tells us of individuals like unto ourselves; the one introduces us to the hero, the other acquaints

us with the man. To all classes, but especially to the young, biography, rightly studied, must be of vast importance. Who can peruse the life of a depraved man, marking its deceitful commencement, tracing its gloomy course, and meditating on its cheerless close, without having his hatred to vice increased? Or who can read the history of a good man, firm in great principles, consistent in righteous conduct, and happy in himself, without being encouraged to tread in his footsteps, and being strengthened for the performance of "every good word and work?" But here the exercise of discrimination is required, as no character is perfectly evil or perfectly good. The heart of humanity bears indications of great convulsions, similar to those which geologists tell us must have taken place in the crust of the earth, which have lifted to its greatest heights shells that must have been formed in ocean caverns, and cast to its deepest depths the fossil upland herb and mountain moss. It is thus with man; the loftiest spirit bears some marks of evil, and the lowest soul possesses some relics of good; and we must not admire all that we see in the one, nor condemn all that we find in the other.

We offer these words of warning on general principles, and not on account of any detracting

peculiarities connected with the individual whose biography is now before us. Indeed, so far from this being the case, it has rarely been our lot to meet with the record of a life of more consistency, or the delineation of a character of more harmonious proportions. Yea, further, such is the high estimate that we form of the late M.P. for Leeds, that we hesitate not to refer to him as a model for the young working-men of England, which it would be well for them to study and imitate. In order to induce our readers to do this, we present them with the following sketch of his life and character.

Edward Baines was born on the 5th of February, 1774, at Walton-le-Dale, a village in the beautiful valley of the Ribble, about a mile from Preston. His father carried on the business of a grocer, and afterwards that of a cotton-spinner. Edward was a healthy and sprightly child, and as he rose into boyhood he manifested more than the usual amount of mirth and mischief. He was sent to the free grammar-school of Hawkshead, the master of which was partial to his scholar, and is reported to have said that "he would either be a great man, or be hanged." He afterwards went to the Preston free-school, where he appears to have been a leading spirit in those juvenile rebellions, better known of old than at present, as "barrings out." When these boyish pranks were laid aside, and he and his companions, having been put to business, began to employ their leisure in reading, speculating, and spouting, five of them conceived the project of emigration. Having heard that in the United States there was great encouragement for every kind of talent, and especially a want of good schools, and having a comfortable conceit of their own qualifications, they planned the establishment of an academy on an extensive scale on the other side of the Atlantic. They allotted to each other their several positions; young Baines, as a matter of course, was to be the principal; one of the number was to be professor of botany, another of music, and so forth. After long deliberation, the consultation of maps, &c., they determined to set out upon the expedition. They actually left Preston one Sunday morning for Liverpool, one having in his pocket the large sum of 16s., another 13s., and the other three smaller sums. It would seem that a night of the ocean brought them to their senses, for on the following Friday they were found returning to their fathers' homes, prodigal-like, with empty pockets and hungry stomachs. Visionary as this scheme was, it was not more so than the Pantisocratical project of Coleridge, Southey, and their friends, a few years later; and perhaps not much more delusive than some of the schemes that may have flitted before the imagination of many whose eyes will fall upon these pages. But in due time the aspiring spirit of young Baines had to yield to the stern realities of life, and he was bound an apprentice to a stationer and printer. That occupation appears to have been in accordance with the intellectual bent of his disposition, and he became a diligent and expert workman.

His love of study happily preserved him from the habit then so common in Preston of spending the evening at the tavern. There was no institution in that town for the intellectual improvement of the young, but he nobly determined to establish one, and soon, with a few friends, formed

a debating society, and afterwards was instrumental in opening a news-room. Although they exercised the greatest discretion in order to avoid producing an unfavourable impression as to the nature of their discussions, yet the excitement attendant upon the French Revolution caused them to be suspected, and *they were threatened with prosecution by the magistrates!* The intellectual character of Edward Baines was now developing itself with rapidity. It was sound and vigorous, not brilliant. In all matters, personal and relative, he manifested that desire for improvement which characterized him through life. When about nineteen years of age his master undertook the publication of a newspaper called the *Preston Review*, and, though it existed only twelve months, it doubtless gave to the apprentice a bias toward that which afterwards became his own profession, and the means of his success and usefulness.

Things went adversely with his master, work fell off and Edward obtained his indentures, and, with the approbation of his parents, left his native town to seek his fortune. The brave apprentice, stout of heart and limb, set out from Preston to Leeds on foot, with his bundle under his arm. He passed on his way with no companion but his staff, and all his worldly wealth in his pocket. Wearied and wayworn he entered Leeds, and applied for a situation in the office of the *Leeds Mercury*, secretly resolving that if ever he obtained a footing there he would not lose it, and in a few years the office and the newspaper became his own. He was received into the *Mercury* office, and soon won the confidence of his employers by his industry and good conduct. He acted on the good old maxim, that whatever is worth doing at all is worth doing well. He laid the foundations of future success in the thorough knowledge and performance of the duties of a workman. His biographer gives us a glimpse of the way in which he now spent his leisure time, and it was quite worthy of him. He sought the friendship of intellectual young men, and became a member of the "Reasoning Society," the object of which was to improve the mind by reading and discussions. Although political questions were excluded, they were suspected, "in the good old times," of being seditious; but, to remove this impression, four of their number (among whom was Mr. Baines) boldly waited upon the mayor, showed him their rules, and invited him to attend one of their meetings. This he did, and expressed himself satisfied. Mr. Baines was a frequent speaker at the "Reasoning Society," and it is said greatly improved by the exercise; and thus became fitted for the part which he afterwards took in the meetings of his adopted town, and the senate of his country. When he first came from Lancashire he had, with all his amiability of speech, a degree of roughness and some hesitations. Both were corrected by painful labour. The president, a penetrating man, pronounced him "a diamond in the rough." There was a feature in his conduct at this time that we give record for the benefit of our youthful readers, that he was always prudent and conciliator in debate. He never quarrelled or contradicted when strongly differing, he would reply to effect, "Do you think it was so?" He appears to have well understood the philosophy of tenacity and to have possessed the power of self-control. (To be continued.)

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. V.—THE PHILOSOPHY OF LANGUAGE.

We intended to attempt the substantiation of the opinion that "Thought and Speech are the same, except that the internal and silent discourse of the Mind with herself is called *ἐπινοια*—i.e., cogitation; while the effusion of the mind through the lips is denominated *λογος*—i.e., rational speech;" that *ratio*—thought and *oratio*—thought-expression, are two different terms to denote the same thing in different states—by adducing illustrations to prove that even in very many of the *minutiae* of Language, the operation of the same generic mind-laws might be observed, and thus endeavour to establish it as a truth, that though there are striking varieties in human speech, from the barbarous guttural of the vocables of the wretched Esquimaux—the harsh Tiascalan tongue—the rude *talker-talkee* of our West Indian colonies—the broad Dutch—the monosyllabic Chinese—the unmelodious German—the majestic Spanish—the fluent French—the smoothly euphonic Italian—the copious Sanscrit—the flexible Greek—the sinewy Latin, to that Language in which, according to Camden, "substantialnesse combineth with delightfulness, and fulnesse with finenesse, seemliness with portliness, and currentnesse with stayednesse"—essentially similar necessities of thought are felt, and contrivances remarkably alike have been employed for the purpose of overcoming the difficulties thus experienced. But we have been led to abandon this design from a conviction that while it is undoubtedly a question of great philosophic importance, it is yet destitute of the practical usefulness which we desire to cultivate in our articles on this topic.

We purpose, therefore, in this article to present our readers with a succinct *resumé* of so much of the teachings of English Grammar as shall be assumed in the following articles on Style; and this we shall do, not because we think that our readers are wholly ignorant of the subject, but because we recognise it as the duty of an instructor who really desires the improvement of those who study his productions, to presume ignorance on the part of his readers, not only in order that a fair idea of the amount of knowledge desiderated in his readers may be laid before them; but also, that should any of them really be ignorant, they may have the opportunity presented to them of furnishing themselves with the precise amount of knowledge in the precise way which is thought most suitable for the future amicable co-operation of instructor and instructed. "To begin at the beginning," although apparently the most tedious method of procedure, is undoubtedly the best. It can, we apprehend, offend no one, for he who possesses the knowledge can be but little injured by having the sum of that information recalled to his mind, while he who is unacquainted with the information cannot be hurt at the offering of the very information of which he is in want. Either way, therefore, we hope to be exonerated from blame, and to be honoured by the one, as sincerely desirous of his advancement, and by the other, as endeavouring to create a good understanding between him and ourselves.

By pursuing this course two very important purposes are subserved:—1st. Those who have previously acquired the information have their memories refreshed, and their former acquirements vividly recalled, so that they are better fitted for perusing the subsequent articles intelligently, and judging clearly regarding their merits—their accuracy or inaccuracy. 2nd. Those who are unacquainted with the preliminary pre-requisites of study which the given topic demands, are made possessors of the precise amount of information required, in the order which the writer prefers, and are thus placed, during the period of their study of that subject at least, on a par with those of more varied and extensive acquirements.

The importance and necessity of a knowledge of English Grammar, and the advantages which it confers, are so obvious, that little space need be occupied in attempting to recapitulate them. Without such knowledge as it imparts, a correct and idiomatic method of expressing our thoughts—an ability to communicate our ideas in that manner which shall make them most readily comprehensible to those around us—a clear, concise, and perspicuous style—cannot be acquired. It is the foundation of elegance, refinement, and effectiveness of speech, the necessary preliminary to the precise utterance of thought, and consequently the very basis on which a true and practical Rhetoric must be constructed. Rightly did the ancients regard it as the propyleum of the temple of Wisdom, which could only be reached by passing successively through the *Trivium* and *Quadrivium*. The following quaint lines will inform our readers of the topics of study which were therein comprised:—

“GRAMM. loquitur, DIA. vera docet, RHET. verba colorat;
MUS. canit, AR. numerat, GEO. ponderat, AST. colit astra.”

“Allow me, however, before I dismiss the subject, to observe that dry and intricate as it may seem to some, it is, however, of great importance, and very nearly connected with the philosophy of the human mind. For if speech be the vehicle or interpreter of the conceptions of our minds, an examination of its structure and progress cannot but unfold many things concerning the nature and progress of our conceptions themselves, and the operation of our faculties—a subject that is always instructive to man.”

In the preceding article we placed before our readers, in a comprehensive tabular scheme, the designations, definitions, &c., of the several classes of words; or, as the grammarians denominate them, “the parts of speech.” These, therefore, we shall not recapitulate, but shall proceed to offer a few observations on the Inflection and Syntax of these “parts of speech,” in the order which they occupy in that scheme. Previously, however, to doing this, we shall find it necessary to give a few

PRELIMINARY DEFINITIONS.

INFLECTION is a word employed by grammarians to denote those changes which are or ought to be made in the form of words, to express any modification of meaning in these words.

SYNTAX informs us of the rules by which we should be guided in the arrangement and elocation of words in order to form sentences correctly.

* “Blair’s Lectures,” ix. vol. i. p. 195.

A Sentence is any number of words so collocated as by their combination to form complete sense—i e., in other words, to enunciate some truth, make a distinct assertion, or make known some action or passion.

Remark.—It is not, however, one of the primary duties of grammar to attend to the sense—that, properly speaking, belongs to logic; hence a sentence may be grammatically correct, while it contains no definite meaning, or may even be an incongruous and inconsistent farrago of nonsense. The following illustration we extract from “The Comic Grammar”:—“If the year consists of 365 days 6 hours, and January has 31 days, then the relation between the corpuscular theory of light and the new views of Mr. Owen is at once subverted; for, ‘when ignorance is bliss, ’tis folly to be wise;’ because 1,760 yards make a mile, and it is universally acknowledged that ‘war is the madness of many for the gain of few;’ therefore, Sir Isaac Newton was quite right in supposing the diamond to be combustible.” On the contrary, however, no sentence that is ungrammatical can, in the strict sense of the term, be said to have a distinct and unmistakable meaning. We may guess at it, and believe that we have found it, or we may charitably assume that we understand it, but ungrammatical construction and unmeaningness are in reality nearly related to each other.

INFLECTION OF NOUNS AND PRONOUNS.

1. **PROPER NOUNS** are the names of individual persons or places, as James, London, Victoria.

2. **COMMON NOUNS** are generic names applicable to several species or individuals, as man, city, queen.

REAL NOUNS are names of such objects as impress the senses.

IDEAL NOUNS are names of mental conceptions.

COLLECTIVE NOUNS are names of classes of objects; they are singular in form, though referring to many.

VERBAL NOUNS are the names of assertions, as to live, reading.

ABSTRACT NOUNS are the names of qualities mentally considered as separate existences.

3. **PERSONAL PRONOUNS** are such as refer to persons.

4. **RELATIVE PRONOUNS** are such as carry back the mind to an antecedent noun, or part of a sentence used as a noun. The use of the relative pronoun is to enable us to express those compound attributes for which we have no adjectives in our language; they ought never to be used unless when this is the case.

5. **ADJECTIVE PRONOUNS** are those which indicate, at the same time, both person and quality.

POSSESSIVE PRONOUNS denote person and ownership.

DEMONSTRATIVE PRONOUNS point out the particular persons or things to which we refer.

DISTRIBUTIVE PRONOUNS are employed when we wish to make assertions regarding the individuals of a class separately and severally.

INDEFINITE PRONOUNS are employed when we do not choose to limit our assertions to specific numbers, or are unable to do so.

6. **NOUNS** are inflected to express number and case.

7. **Nouns** have two numbers, Singular and Plural; the former denotes one, the latter more than one.

8. When the letter *s* readily coalesces with the terminational sound of a singular noun, the plural is formed by the addition of *that* letter.

9. When, however, the *s* sound does not coalesce euphoniouly, the plural is formed in one of the following manners:—

1. Those which end in *ch* (sounding *tsh*), *s*, *sh*, *x*, or *o*, preceded by a consonant, add *es*—switch, switches; glass, glasses; blush, blushes; motto, mottoes.

Note.—*Ch* sounding *k*, and *o* preceded by a vowel, as well as *canto*, *duodecimo*, *grotto*, *junto*, *octavo*, *portico*, *punctillio*, *previso*, *solo*, *quarto*, *tyro*, add *s* only.

2. Those which end in *y*, preceded by *u* or a consonant, after conforming to the usual orthographical rule—viz., words ending in *y*, preceded by *u* or a consonant, on taking any affix except *ing*, change *y* into *i*; as, *marry*, *marriage*; *merry*, *merriment*; *happy*, *happier*; *rally*, *rallied*, &c.—add *es*, as *sky*, *skies*.

3. All nouns ending in *f*—except *staff*, which has *staves*, and the following words in *f* or *fe*, viz., *brief*, *chief*, *coif*, *coof*, *fief*, *fife*, *dwarf*, *grief*, *giraffe*, *gulf*, *hoof*, *kerchief*, and its compounds, *proof*, *rcef*, *reproof*, *roof*, *safe*, *scarf*, *serf*, *strife*, *surf*, *turf*, and *wharf*, add *s*; but the following words, viz., *beef*, *calf*, *elf*, *half*, *knife*, *leaf*, *life*, *loaf*, *self*, *shelf*, *sheaf*, *thief*, *wife*, *wolf*—change *f* into *v* before adding *es*.

Note.—Some nouns derived from foreign or dead languages retain the plurals of the original tongues; some are irregular, some want the plural, some have no singular, while others have apparently plural terminations with a singular signification; but the detail of these *minutiæ* would lead us too far. See, on this subject, Latham's "English Language."

10. Case is that inflection by which the states and relations of nouns, and their substitutes, pronouns, are indicated.

11. There are three cases—Nominative, Possessive, and Objective.

12. A noun is in the Nominative when it is the subject of an affirmation.

13. The Possessive denotes proceeding from or out of, and possession.

14. A noun is in the Objective when it is the name of the object upon which an action is performed, or in which the relation implied in a preposition is exhibited.

15. The Nominative and Objective of nouns are alike in form.

16. The Possessive is indicated by the addition of an apostrophe *s* (*'s*) to the singular, and by the apostrophe (*'*) alone in the plural, except when the plural does not end in *s*, in which case the plural follows the same rule as the singular.

Note.—The Possessive is frequently formed by the use of *of* before the noun or pronoun, e.g., *The crown of the king*. *A servant of the Lord*. "Ay, and that tongue *of his* which bade the Roman mark him." "These threats *of theirs* disturb me not a jot." This may be called the Prepositional Possessive.

17. In English nouns Gender is *not* indicated by inflection, but, in general, by different words. When this is not the case, a prefix or affix, denotive of sex, is employed.

18. There are two genders, Masculine and Feminine.

19. Inanimate things and animals, whose gender it is unimportant to distinguish, are called Neuter.

20. PRONOUNS are inflected to express Number, Gender, Case, and Person.

21. As pronouns are the substitutes of nouns, Number, Gender, and Case mean precisely the same in relation to them as to nouns.

22. The person *speaking*, is called the first—the person *addressed*, the second—the person or thing *spoken of*, the third.

23. As the first and second persons are in general present while speaking or spoken to,

their gender is known, and the English Language, economically, leaves the pronouns denotive of these persons uninflected for gender. The third person, however, who is perhaps more frequently absent than present, has the representative pronoun inflected to express gender.

24. The Personal Pronouns are thus inflected:—

	SINGULAR.			PLURAL.		
	Nom.	Poss.	Obj.	Nom.	Poss.	Obj.
First Person, Masculine or Feminine	I	Mine	Me	We	Ours	Us
Second "	Thou	Thine	Thee	Ye or You	Yours	You
Third "	Masculine	He	His	They	Theirs	Them
	Feminine	She	Hers			
	Neuter	It	Its			

25. The Possessive Adjective Pronouns are derived from the possessive cases of the personals, and are—my, thy, his, her, its, our, your, their. Mine and thine—euphonic forms of my and thy—are sometimes used before words beginning with vowels; own is added to express possession more emphatically.

26. The Demonstrative Adjective Pronouns are—This, that, with their plurals, these, those; and yon, yonder.

This and yon, refer to the nearer or latter mentioned; that and yonder, to the more distant or prior mentioned.

27. The Distributive Adjective Pronouns are—each, every, either, neither; each signifies two taken individually; every, many, singly; either, one of two; neither, none of two: they are, therefore, singular.

28. The Indefinite Adjective Pronouns are—all, another, any, aught, both, certain, few, much, many, none, naught, one, other, several, some, such, whole.

29. The Relative Pronouns are—who, which, that.

Who is applied to persons, and things when personified—which, to the lower animals, and objects named by neuter nouns—that, to prevent the too frequent use of who or which.

They are declined alike in both numbers, thus:—

Nominative—Who, which, that.

Possessive—Whose.

Objective—Whom, which, that.

What, who, and which, when compounded with ever or soever, are called Compound Relatives. Who, which, and what, when employed to ask questions, are called Interrogative Pronouns. What, as a relative pronoun, is always neuter; as an interrogative, it is applicable to all genders.

INFLECTION OF ADJECTIVES.

1. **PROPER ADJECTIVES** are such as are derived from proper names. They are uninflected.

2. **COMMON ADJECTIVES** are generic terms used to express the qualities, &c., of existences.

REAL ADJECTIVES express qualities, &c., which affect the senses.

IDEAL ADJECTIVES denote the qualities, &c., of mental conceptions.

PARTICIPIAL ADJECTIVES indicate qualities, &c., combined with a portion of the assertive power of a verb.

NUMERAL ADJECTIVES express numbers. They are of two kinds—**CARDINAL**, as one, two, three, &c.; **ORDINAL**, as first, second, third, &c.

3. **Adjectives** whose signification is capable of increase or diminution are inflected by comparison.

4. There are three degrees of comparison—Positive, Comparative, and Superlative.

When an adjective merely expresses the simple quality, it is said to be in the Positive degree.

When an increase or diminution of the simple quality is indicated, it is in the Comparative.

When the greatest increase or diminution is denoted, it is Superlative.

Note.—There is no possibility of fixing with precision the meaning of adjectives, as each person's ideal differs from that of his neighbour's.

5. All monosyllabic adjectives, and those dissyllabic ones which end in *e* or *y*, form their comparative by the addition of *er* or *r*, and the superlative by *est* or *st*; *y* (as in the case of nouns) being changed into *i* before taking the affix.

6. All other adjectives remain uninflected, but adverbs are employed to express those modifications of idea which comparison involves.

7. A few adjectives are irregular in their inflections. (See Latham's "English Language.")

8. When one noun precedes another, as in *steel pen*, *morning star*, &c., it is in our opinion better to call the two collocated words a compound noun, than, as is usually done, the former an adjective.

9. A few adverbs admit of inflection, by comparison, like adjectives, as *soon*, *sooner*, *soonest*.

INFLECTION OF VERBS.

1. ACTIVE-TRANSITIVE VERBS are those which make assertions regarding actions performed by an agent upon an external object, by which the former influences the latter.

2. ACTIVE-INTRANSITIVE VERBS are those which relate to actions wholly confined within the agent, and, consequently, not influencing an external object.

3. Passive Verbs are such as indicate the enduring of some action, either pleasing or painful, by the subject; strictly speaking, however, there are no passive verbs in our language.

4. Neuter Verbs are such as make affirmations regarding attributes or states of being without expressing either action, or endurance.

5. Voice is the technical term which grammarians employ to indicate the different species of verbs; viz., Active-Transitive, Active-Intransitive, Passive, and Neuter.

6. Mood is a particular form of the verb by which the assertion contained in it is modified.

There are, it is usually said, five moods—viz., Indicative, Potential, Subjunctive, Imperative, and Infinitive; but in our opinion there are not more than three, if so many—viz., Indicative, Desiderative, and Infinitive.

The Indicative simply asserts or asks a question.

The Desiderative indicates *desire*, which may either be expressed in entreaty, command, exhortation, &c.

The Infinitive is the unlimited mention of the assertion. It is frequently, if not always, equivalent to a noun.

7. Tense denotes the time implied in the verb.

There are no other real tense-inflections in English verbs, except those which imply present or past time.

8. Number denotes whether the assertion is made regarding one or more.

9. Person refers to the subjects of the verb, whether they speak, are addressed, or are spoken about.

10. Verbs may very usefully be divided into two classes—viz., Generic and Specific.

11. Generic Verbs are such as express the necessary *categories* of the intellect regarding assertions; they are—

PRESENT TENSE.	PAST TENSE.	SIGNIFICATION.
Am	Was	Existence or being
Can	Could	Power or ability
Do	Did	Action or emphatic assertion
Have	Had	Possession
May	Might	Liberty or permission
Must	—	Necessity
Shall	Should	Duty or obligation
Will	Would	Volition or intention

and are commonly denominated auxiliary verbs.

12. All other verbs, as they assert in a more limited sense, may be denominated specific.

13. The tense-inflections of verbs may be exhibited thus—

ACTIVE VOICE.

INDICATIVE.

PRESENT TENSE.		PAST TENSE.	
Present Participle—Learning.		Past Participle—Learned.	
Singular.	Plural.	Singular.	Plural.
1st Person. I learn	We learn	1st Person. I learned	We learned
2nd „ Thou learnest	Ye or you learn	2nd „ Thou learnedst	Ye or you learned
3rd „ He, she, or it learns (or any noun)	They learn (or any noun)	3rd „ He, she, or it learned	They learned (or any noun)

DESIDERATIVE.

Second Person singular—Learn thou. Second Person plural—Learn ye.

INFINITIVE.

To learn.

14. All the other modifications of tense or mood are made through the aid of the generic verbs.

Am, when joined to the present participle, composes the progressive form of the indicative, but when connected with the past participle, it constitutes the passive voice.

Can and may, when joined to the root-form of the verb, compose the present and past of what is called the potential mood.

Have, joined to the past participle of any verb, forms the perfect and pluperfect indicative.

Do, added to the root-form of the verb, constitutes the emphatic indicative.

Must, prefixed to the root-form of any verb, makes the present potential.

Shall and will, when joined in their present tenses to the root-form of any verb, constitute the future indicative. Their past tenses, similarly conjoined, form the past of the potential.

The proper use of the auxiliaries shall and will, are exhibited in the following formula—

Futurity dependent on the will of the speaker.	I } We }	You } He } They }	Will } Shall }	Futurity independent of the will of the speaker.	I } We }	You } He } They }	Shall } Will }

For the Latinized mode of verb-inflection, see any common English Grammar.

15. The following examples may assist the reader to comprehend this modifying power of the generic verbs:—

1 He ne'er is crowned
With immortality, who fears to follow
Where airy voices lead.—KEATS.

2 White cottages were seen,
With rose trees at the windows.
BRYANT.

SYNTAX.

1. Syntax is divided into two parts, Concord and Government.
2. Concord is the agreement of one word with another in inflection.
3. Government is the influence which one word exercises over another to alter its inflections.
4. The general rule of Syntax is that the parts of speech should be so colligated as best to express the relations, connexions, influences, and successions of thought, and to give accurate and adequate development to our ideas. It is, however, more practically presented under the following subdivisions:—

SYNTAX OF VERBS—THE SUBJECT AND THE VERB.

1. The subject of the verb should be in the nominative.
2. A verb should agree with its nominative in number and person.
3. The following is a classified list of the nominatives which a verb may have, with the number and person indicated, viz.:—

<i>Singular.</i>	<i>Plural.</i>
1st. I.	1st. We.
2nd. Thou, or the name of any person addressed.	2nd. Ye or you, and the names of persons addressed.
3rd. He, she, or it; any singular noun; any collective noun signifying unity of idea; two or more singular nouns separated by <i>or</i> or <i>nor</i> ; a part of a sentence signifying unity of idea; and the infinitive mood used as a noun.	3rd. They; any plural noun; any collective noun signifying plurality of idea; two or more singular nouns conjoined by <i>and</i> ; a part of a sentence signifying plurality of idea; and two or more infinitives conjoined by <i>and</i> .

4. Active-transitive verbs govern nouns and pronouns in the objective case.
5. One verb governs another in the infinitive mood.
To, the sign of the infinitive, is not used after the verbs, bid, dare, feel, hear, make, need, see, the generic verbs, and a few others.
6. The verb *To be* has the same case after as before it.
7. The infinitive mood and the present participle are sometimes used as nouns; when the latter is so used it requires an article (*a*, *an*, or *the*) before it, and *of* after it.

SYNTAX OF NOUNS AND PRONOUNS.

1. Nouns, pronouns, and parts of sentences, when put in apposition—i.e., when they are employed to express the same thing—agree in case.

A noun or pronoun which answers a question should be in the same case as that which asks it.

2. A noun or pronoun which denotes the possessor of an object, is put in the possessive case. When two or more nouns are employed to designate the possessor, the latter or last only, takes the possessive form, but if one object or more belongs at once to two or more individuals, each of the nouns which name them take the possessive.

3. Personal pronouns agree in gender, number and person, with the nouns of which they are the substitutes.

4. A relative pronoun is the nominative to a verb when no noun intervenes between the relative and the verb.

5. Adjective pronouns are used to qualify nouns.

6. The distributive pronouns require verbs and pronouns in the singular.

7. The demonstrative pronouns agree in number with the nouns which they qualify.

SYNTAX OF ADJECTIVES.

1. Adjectives sometimes govern the infinitive mood.

2. When opposition is signified by a comparative adjective, it requires *than* after it; when distinction is indicated, *of* is necessary.

3. Double comparatives and superlatives are improper.

4. Adjectives should not be used as adverbs, nor adverbs as adjectives.

SYNTAX OF ADVERBS, PREPOSITIONS, CONJUNCTIONS, AND INTERJECTIONS.

1. Adverbs are generally placed, 1st before adjectives; 2nd, after active-intransitive and neuter verbs; 3rd, between the generic verbs and the root-form of the other verb; 4th, either before an active-transitive verb or after the object upon which their influence extends itself.

2. Prepositions govern nouns and pronouns in the objective case.

3. Certain words and phrases require particular prepositions after them. These, however, can only be learned accurately from careful reading. (See, however, a collection of such words in any grammar.)

4. Conjunction conjoins the same cases of nouns or pronouns, and the same moods and tenses of verbs, unless the sense absolutely requires that they should be changed.

Some conjunctions have corresponding conjunctions, *e. g.*—*as, as; as, so; both, and; either, or; neither, nor; so, as; so, that; though, yet; whether, or; &c.*

5. Interjections generally have no power over other words, but *O! oh! ah!* require the objective case of the pronoun of the first person, and the nominative of the second.

Such is a brief glance of the grammatical knowledge which we shall presume our readers to possess, in our future papers. The extreme length of our present article precludes further remark. In our next prelection, "On the History and Structure of the English Language," we shall resume the subject in a style less dry and formal. Meanwhile we must remind our impatient readers, that sound grammatical information is the basis of style, and is therefore deserving of some attention. This we hope they will bestow, and if they do so, they will have no cause hereafter to rue the irksome labour which it cost them; and we shall now conclude with the words which we employed in our first paper two years ago, let these things be well understood, and "let their value be accurately appreciated now, so shall we the less require to interlard our future articles with explanatory clauses and parenthetical divergences."

Religion.

CAN CHRISTIANS, CONSISTENTLY WITH THEIR PRINCIPLES, RENDER SUPPORT TO THE BRITISH STAGE?

AFFIRMATIVE ARTICLE.—II.

BOUNDARIES are always perplexing. No eye can perceive the limit where the dubious shadow merges into the flickering light. The microscope unsettles the divisions of the naturalist; Oregon and Caffraria disturb the politician; theologians quarrel over the subtleties of grace; and the peccadilloes of one moralist are the damning criminalities of another. The circumference of pleasure within which a religious man may safely indulge, has always been one of those vexed questions so desirable yet so difficult to be solved. All, however, who have any right sense, deny the applicability of the third postulate of Euclid—"that a circle may be described from any centre and with any radius." But upon this, as upon every other similar subject, there might be more proximity of opinion, if candour and liberality would bring the disputants fairly together. Unfortunately, men are accustomed to quarrel violently in proportion as it is their duty and interest to enjoy one another's friendship. As religion is the dearest concern of mankind, it has disturbed the relations of society with melancholy consistency, and it will continue to do so while human nature retains its present constitution. It would, perhaps, be vain to attempt the conversion of mankind to one system of theology: men are fond of pet dogmas, and when these are harmless, neighbours would do well to consider them innocent; but it is neither vain nor unserviceable to attempt to bring the world to one way of thinking upon minor questions of practical morality. Why may not the disciples of Swedenborg, Knox, and Whitfield meet the men of the world with smiling looks upon neutral ground? It is true that evil communications corrupt good manners; but it is also true that good communications improve bad manners. As affairs at present stand, the envy which wishes to enjoy earth, yet dares not, denounces pleasure as a delusion of Satan: the worldliness which is inwardly abashed shakes off

its restraint by a sarcasm against hypocrisy. Under the excitement of rancour the breach cannot be healed; a pettish humour will not allow of a parley; so that each party continues to spite itself out of spite to its opponent.

The question proposed at the head of our article is an excellent introduction to the general dispute. Upon the decision will turn the fate of the whole tribe of these social disagreements. If plays are sanctioned, certainly there will be no prohibition of pictures, music, dancing, and other agreeable means of relieving our monotonous hours. Those who regard these inquiries as mere subterfuges to provoke a dalliance with sin, may as well lay down the page and rejoice in their possession of an intuitive excellence.

The common objections to play-going are three—the immorality and indelicacy of the performance; the loose habits into which the frequenters of the theatre are likely to fall; and the craving for excitement which is engendered in the mind.

Against the first charge of immorality it may be replied, that it is an incidental, not an essential, objection. It is allowed by critics that virtuous sentiments are the solid foundation of good writing. Vice may be pompous and gaudy, but it dares not assume the disguise of a majestic simplicity. The highest conceptions of genius are by nature devoted in the womb to the cause of truth. The drama, above all other composition, has the privilege of striking the soul with the intensity of goodness; it combines the vividness of contrast, the interest of incident, the charm of variety, and the force of reality while the feelings are yet soft with pity, warm with passion, it impresses the lesson which memory will hold with the tenacity of instinct. But to produce this wondrous effect all the faculties must be engaged; the whole being absorbed; we must forsake the closet and go to the stage; the imagination must be laid under the enchantment

action: eyes and ears must witness the earnestness of suffering, the terrible agony of guilt, and the sublime countenance of heroism. The tones and gestures of human nature must refine our sympathies, and render us sensitive to the appeals of mute creation.] While tragedy will tutor our great passions, comedy will restrain the pakey inclinations which pervert the happiness of common life. The mirror held up to nature will shock with the image of our own follies; we shall be the more inclined to correct them, because, though the wit was pointed and sank deep, we were solitary witnesses to our inward shame. In a word, the drama will educate the heart by making it familiar with excellence.

It is answered, that Christians do not emulate the task of heroes, because their duty is confined to the exercise of sober virtues. But Christians have no right to shrink from the world. Luther, Knox, Bunyan, Wesley, and Howard were brought face to face with troubles and contentions; it was the divine spirit of enthusiasm which lifted them above terror. Every man, in his station, may wish to persuade a neighbour of the benefits of religion; but the intellect will seldom be converted until the feelings are touched; there must be rapture in the preacher who would startle apathy. The fanatics who reject the aid of learning, and the quietists who repress emotion, commit faults equally fatal. A Christian must take the world as it is—not an association of varends and elders, but a rough multitude, who must be acted upon by strong influences. If he understand nature, he will know that passion is the key to the heart, and that the pathos of Orpheus must win mankind to virtue.

Lessons in the art of Propagandism could be nowhere better acquired than in the exhibitions of a talented and moral theatre. Whether the British stage of the present day can claim the merit of such beneficent influence is a question requiring details. It is acknowledged that mere theatrical entertainment has usurped the place of the drama; the stage, in fact, is no longer a stage, but a place devoted to scenic display, witticisms, buffonery, evanescent satire, and, in some instances, to smart ribaldry addressed to initiated spectators. A few hours' mere recreation is the confessed object of the

sight-seers, and it consequently depends upon the character of the individual whether or not he should run the hazard of a questionable indulgence. It is undeniable that in too many cases persons of delicate taste and severe self-respect could not witness the modern spectacle with satisfaction, while the susceptibility of youth is perilled without the compensation which works of true genius would afford.

The second objection, that the frequenters of the theatre must necessarily fall into loose habits, is not only trivial but also foreign. Every evening entertainment of a town is dangerous to those who have no moral restraint. The temptations, besides, are out of doors, and the weakness of those who fall into them is in nowise attributable to a short hour's acting, but to the neglect of responsibilities during long years, when young but strong self-will was establishing the vicious character. The Christian who cannot run the gauntlet of a visit to a playhouse, may be benefited by considering the phantasms that bewitched the saintly hermits of old in the seclusion of deserts.

The third and the strongest plea which can be objected to dramatic representations is their tendency to create a craving for excitement. This can be insisted upon with force in opposition to the light and exhilarating productions now so prevalent. Melpomene herself cannot be acquitted without examination. It may be urged that the moments of life are pre-occupied for the most pressing interests. The acquisition of heaven is a task so arduous, that it will not admit of the briefest intermission; the elevated temper of the pious mind cannot be disturbed by the violent transitions of a romance, which teaches nothing beyond a philosophic morality; and further, the demands of social Christianity occupy the leisure which is required to be "fruitful in good works." Such considerations would be unanswerable if they were admitted to represent the indispensable demands of religion. But do they present a just estimate of the duty of a Christian? Is he commanded to dwindle his life between strained efforts of mystical devotion and the stiff performance of charity? There is a grace that should accompany benevolence which enhances the service, and endears the giver. This grace is the offspring of a cultivated taste; the sensibilities

are educated in the presence of beautiful objects; the mind which is familiar with the noblest ideas of literature carries with it solace for the afflicted and strength for the desponding. Warmth of feeling and delicacy of behaviour, so far from being incompatible with religion, are calculated to support and recommend it. This sympathy is to be cultivated in the intercourse of society, or in the impressive company of great writers. So long as conscience and the curb of occasional retirement impose a due restraint, there need be no alarm that the soul will be jeopardized by a hydrophobic aversion for sacred things. Besides, all morality is akin, whether contained in Aken-side's "Pleasures of Imagination," Beattie's "Minstrel," or the Bible. There is a great difference between diverging from a path at right angles, and walking in a line parallel to it. If a love of art or an admiration of nature be sufficient to debar from paradise, alas! for thousands of Christians, whose amiable dispositions will forfeit the reward which Calvin will inherit.

When we dread a reasonable excitement, we are in effect careless of the health which is supported by activity. Stagnation is death. The exclusively pious are aware of this, and endeavour to stir their dulness with revivals and jubilees. None but the morose enthusiast or the long-habituated devotee can subdue affections within the limits of sectarian propriety. The eye will be charmed with colour and the ear with sound, notwithstanding the code of a factitious conscience; common sense has an affinity for innocence, and will not be imposed upon by the story of a lurking sin. New scenes and new associations of ideas stimulate the faculties, and the mind returns refreshed to the enjoyment of its habitual duties. And if the charms of a landscape, the grace of an exquisite statue, the harmony of light and sound, are gratifications indulged in by many serious people, how can the nobler tragic spectacle be, with any plausibility, renounced? There is nothing so terrible in human nature that it should be dangerous to regard it under the aspect of glowing sentiments. Fervent Christians live in an atmosphere of excitement; they are alternately depressed and exalted; they reflect upon miracles and anticipate glory. The occasional sympathy awakened by fictitious passion would not

weaken anxiety for their own vast expectations, but would rather benefit by checking selfishness, and by cherishing an interest in the active existence of the world. It is the great failing of what are termed evangelical preachers, that they isolate Christianity, and speak vaguely of the love of Christ and the influence of the Spirit; salvation with them appears to depend chiefly upon the personal disposition being elevated to an undefined state of communion with the divine nature. These indistinct notions float upon the brain of their hearers, who cannot afterwards reconcile themselves to the blunt presence of a matter-of-fact life. The imperative duties of citizenship and of social politics demand the respect—in fact, the honourable attention—of every member of a state. To perform these duties in a becoming manner, there is required something beyond mere pious placidity. The spirit must be roughened, or a good-natured obsequiousness will allow the defeat of an honest cause. This is a world of bustling and roguery, where good men who have the power are bound to interpose the terrors of justice in defence of the weak. The necessity for these sterner qualifications being undeniable, it remains only to decide whether they may not be in a great measure acquired, by frequent perusal of the lives of illustrious worthies, or by the discipline of the dramatic stage. If the stage be a moral one, its efficiency in this regard cannot be questioned; and it should be borne in mind, that the lessons of such a master would allow an abbreviated term of dangerous apprenticeship to the world.

It will be observed, that our arguments in favour of play-going have been placed under restrictions which must be approved by every correct judgment. The indiscriminate pursuit of pleasure is reprobated by prudence as strongly as by religion. None but the unthinking will regret that the compass of their enjoyments is to be circumscribed by a boundary that will exclude the possibility of remorse. Whether a Christian can render support to an immoral British stage, is a question that calls for no discussion. Whether the British stage is and has been a moral one, is not a translation of the term proposed for debate. We have accepted the only construction which can be put upon the words of the question. The limitations which we have enforced were obviously an

avoidable; and the conclusions at which we have arrived follow, we trust, from an impartial judgment, and not from any unworthy suspicion of those who attach higher solemnity to the purposes of life. A serious temper is the acknowledged foundation of every exalted virtue; but seriousness must be associated with cheerfulness, or Christianity will degenerate into misanthropy. Our design has been to show that there is

no necessary evil attendant upon theatrical performances. If our opinions appear unfounded, let our opponents cancel the confirmation of the irreproachable Milton:—

“ Sometimes let gorgeous Tragedy
In sceptred pall come sweeping by,
Presenting Thebes, or Pelops’ line,
Or the tale of Troy divine,
Or what (though rare) of later age
Ennobled hath the buskin’d stage.”

H. T.

NEGATIVE ARTICLE.—II.

It is our purpose in this article to prove, by fair argument and logical inference, that the drama, in its spirit and tendency, is antagonistic to the spirit and genius of Christianity: and if we succeed in proving this, the inference will be that Christians cannot, consistently with their principles, patronize the British or any other stage for dramatic representations.

The first argument we adduce in favour of our position is, that in numerous plays the holy name of God is irreverently and unceremoniously introduced, thereby setting at naught a plain but imperative command, “Thou shalt not take the name of the Lord thy God in vain.” We give the following as a few instances out of a great many in which this irreverent mention of God’s name occurs:—

“Much Ado About Nothing,” Act II., Scene 3; *Ibid.*, Act III., Scenes 1 and 4; “Love’s Labour’s Lost,” Act I., Scene 1; *Ibid.*, Act V., Scene 2; “Merchant of Venice,” Act II., Scene 2; “All’s Well that Ends Well,” Act II., Scenes 2 and 3; “Taming of the Shrew,” Act IV., Scene 5; “Comedy of Errors,” Act IV., Scene 4; “Romeo and Juliet,” Act I., Scene 5; *Ibid.*, Act II., Scene 4. Our friends will perceive that our selections are from the writings of the great master-mind, and that we have not noticed works of inferior men.

But not only on the stage is the third commandment impiously violated: but among the company who frequent theatres are to be found those who are ever and anon assailing the ears of the more polite and polished part of the audience by their rude, coarse, and impious vociferations, tainting the very atmosphere by their pestiferous breath.

2nd. Because it is the resort chiefly of

the immoral and profligate. “Let your light so shine before men, that they may see your good works, and glorify your Father which is in heaven,” is the exhortation of Him “who spake as never man spake.” If it be the duty of Christians to set a good example before the world, how can they be said to do this if by their presence and influence they countenance the profligacy and vice too generally to be met with in and about theatres? We may be met here by professors of religion saying, But we do not countenance vice; the very sensibilities of our nature are shocked at witnessing indecency or vulgarity anywhere. But, friends, how comes it to pass that you are found in such society? “What fellowship hath righteousness with unrighteousness? and what communion hath light with darkness?” It appears the same attractions drew you together; but the vicious are more consistent than you, for whilst they faithfully serve their master, *Sin*, and profess attachment to no other, you, on the contrary, while professing attachment to Christ, sanction, by your presence and influence, the deeds of darkness.

3rd. Because the stage has a tendency to inflame those passions which we are called upon in the word of God to subdue. Man comes into life with affections and susceptibilities suited to his nature, and if properly cultured and directed, they would subserve the purposes of his being, and godliness and virtue would characterize his life; but unfortunately in too many instances a bias is given to his inclinations which has the opposite effect, so that instead of a life of virtuous action, one of deleterious tendency is the result.

One or more of the irregular passions, envy, malice, jealousy, &c., form the basis of

all plays. Now, we ask, what ennobling quality is discoverable in envy? What christian grace in malice? What virtuous disposition in jealousy? Surely it is the duty and interest of every man to curb the irregular desires of his nature; but theatrical representations have the contrary effect, for they fan to a blaze those latent propensities.

4th. Because it is temporizing, and lowers the standard of moral obligation.

The wisest and safest method man can adopt is to make all his advantages subserve the good of his soul: his time, opportunities, privileges, and advantages, are all talents given, or rather lent him, by his beneficent Creator, God, to profit withal; and according to the proper or improper use of these will be his condition in time and eternity. Does the stage enforce the commands of God? Does it incite to love and obedience? Does it imbue the heart with philanthropic sentiments? Does it enable man to view with feelings of commiseration the suffering and distressed? Does it give to his heart kind and sympathetic affections? Does it prompt him to acts of piety and mercy? In a word, does it teach him his duty to God and his fellow-man?—

“Life, like every other blessing,
Derives its value from its use alone;
Not for itself, but for a nobler end,
Th’ Eternal gave it; and that end is virtue.”

5th. Because the glory of God is not the object sought by dramatic representations. The church at Corinth was thus exhorted:—“Whether therefore ye eat or drink, or whatsoever ye do, do all to the glory of God.” We fear that the Christian’s duties are too generally lost sight of. Christianity will not admit of any compromise. The spirit of Christ and the spirit of the world have ever been opposed to each other; and Christians are commanded to “come out from among them and be separate.” Many are the means now in operation to alleviate suffering humanity. To raise man to dignity and honour—to bring him to a state of consciousness relative to the imperishable constitution of his soul—to induce in him holy incentives to action—to lead him to God;—does the stage exhibit those features? Does it inform man as to his lost and ruined condition, and alienation from God? Does it point to the “Lamb of God, which taketh

away the sin of the world”? We know it does none of these: *ergo*, it is not a fitting place for saint or sinner. The profession of the former is incompatible with, and opposed to, the spirit of the stage; while the latter is procrastinating with the gracious invitations of heaven, and making the probability of his salvation more doubtful.

7th. Because it disqualifies the soul for devotional exercises. Communion with God is the life of the soul; it is the highest privilege enjoyed by men or angels; it brings into one fellowship the Infinite and the finite; it lights up the soul with holy ardency, and it invigorates and strengthens its powers. If, therefore, a Christian would retain a sense of God’s favour, and experience the delights resulting from communion with his Maker, he must cultivate the graces and virtues of the Holy Spirit, and keep aloof from those influences that only enervate and enfeeble his powers. When the hour of prayer arrives, will the reminiscence of the scenes he has witnessed at the theatre afford him suitable reflections—inspire him with holy confidence—or induce that calm, serene, and peaceful composure of mind so necessary on these occasions? Let conscience supply the answer.

We have thus given a few reasons why we conceive it to be the duty of Christians to withhold all support from the stage. Whether we are right or wrong, “judge ye.” But there are other weighty considerations quite in harmony with the foregoing, which, for want of space, we can only glance at *en passant*:—1st. Would Christians tolerate in their own houses, and in the presence of their families, the language employed, and the scenes exhibited, in theatres? 2nd. Would they consider the morals of their families improved by these exhibitions? 3rd. Are the advantages and pleasures derived from theatrical performances equivalent to the time spent in witnessing them? 4th. What proportion do they bear in the scale of promoting the general good of mankind? 5th. What are the motives by which the actors are influenced? 6th. What is the general character of stage players? These and other questions of a like import should be maturely weighed ere Christians give their sanction and support to the British stage.

We are here reminded of a fact we once

end of bearing on this subject: it was in substance as follows:—A lady with whom the Rev. James Hervey chanced to be traveling, took occasion, among other things, to speak in high commendation of theatrical amusements. She observed,—“There was pleasure in thinking on the play before she went: pleasure which she enjoyed when there; and pleasure in ruminating upon it when she retired to her bed at night.” Mr. Hervey (who sat and listened without interrupting her), when she had concluded, said to her, “that there was one pleasure more, which she had forgot to mention.” “What can that be?” said she, “for sure I included every pleasure, when I considered the enjoyment beforehand, at the time, and afterwards. Pray, sir, what is it?” To which Mr. Hervey, with a grave look, and in a solemn manner, answered, “Madam, it is the pleasure it will afford you on a death-bed.” The reproof was seasonable, and its effect such that she never visited the theatre again: but, becoming pious, secured those blessings which only can afford satisfaction in death. Well might the poet say—

“All hail, Religion! thou alone can'st fire
Our kindling thoughts with views beyond the
tomb,
To brighter plains by thee we dare aspire,
And snatch a foretaste of the world to come.”

We conclude by offering a word of counsel

and advice to our young friends, in whose welfare we take particular interest.—1st. Seek to realize, by faith in the Lord Jesus Christ, a sense of God's approving smile, and endeavour to keep that evidence bright, by constant watchfulness and fervent prayer. 2nd. Endeavour to subdue and conquer every unholy affection and disposition, by yielding to and encouraging the gracious influences of the Holy Spirit. 3rd. Associate with your ideas of pleasure and amusement the joys which spring from communion with your God. 4th. Let a higher, a nobler principle, actuate you in your pursuit after happiness, than the mere gratification of sensual desires. Many incautiously and inadvertently throw themselves in the way of temptation, and because they have not grace to resist, are made easy victims of the destroyer. 5th. Act upon the advice given by St. Paul to Timothy—“Flee also youthful lusts: but follow righteousness, faith, charity, peace, with them that call on the Lord out of a pure heart.” Lastly, if you think, with us, that the stage exerts a baneful influence upon society, then, in accordance with your convictions, labour to repress it.

“I venerate the man whose heart is warm,
Whose hands are pure, whose doctrine and whose
life
Coincident, exhibit lucid proof
That he is honest in the sacred cause.”

J. E. P.

Philosophy.

IS HOMŒOPATHY TRUE IN PRINCIPLE AND BENEFICIAL IN PRACTICE?

AFFIRMATIVE REPLY.

My attention had been drawn to the articles which have appeared in the *British Controversialist* on this subject, and I have been at the pains of labouring through four negative articles, in the hope of finding something more than words.

How sadly have I been disappointed! I had been led to anticipate that those who should write on the adverse side would at least be men of ordinary attainment in the various branches of physical science, and that therefore we should be exempt from

dealing with propositions at variance with *ascertained* physical principles; whilst the simple enunciation of certain definite expressions would at all events be understood in the sense in which they are *generally received and understood in all scientific schools*. But this expectation was wretchedly dispelled by the two articles of “Vinculum,” by that of L. G. G., and by that bearing the appropriate subscription of A. S.

Voltaire used to say, “Before all things, gentlemen, if we are to argue, let us define

understand, and acknowledge certain terms in certain senses:—a precaution which," he added, "is the more especially necessary when we have to argue with those who use terms without meaning." Now, after the lengthy discussion to which the present proposition has given rise, we are precisely in the dilemma which Voltaire would have obviated. We are engaged in nothing more nor less than a cavil about words, or in a dispute, to say the least of it, in which the interpretation of words is a very essential and very stupid ingredient. "Vinclum," in his first article, starts with a misinterpretation on one essential term, and continues his misconstruction of another term in the second article, which he might have spared himself the trouble of writing, had he begun by *understanding* what he had to write about. Nothing is easier than for any man to put forward the most ridiculous proposition in the world, and then to palm it off as mine, and laugh at me for my pains, whilst he plumes himself upon dispersing to the winds a dogma which has no existence except in his own misunderstanding. It is clear that such an imputation of doctrine does not make the opinion thus easily refuted the dogma which *I* really advocate.

Hear "Vinclum":—"The aphorism, *Similia similibus curantur* [which, by the way, should be *curentur*], is the basis of the whole fabric. 'Like cures like,' explains the anomalies in the action of complex medicaments, no less than in the use of the simpler therapeutic agents: *to reduce a plethoric constitution, prescribe rich viands, and plenty of them; to cure the dropsy, drown your patient with water!* These are obviously fair deductions," &c. &c.

In the first place, the veriest tyro in Latin and Greek grammar would be able to inform you that ὁμοιος does not mean the *same*, but *similar*, and that homœopathy, according to its etymology, would be applied to a method of treatment which employed not the *actual agents* inducing natural disease, but agents capable of inducing *similar* morbid manifestations (even WITHOUT an *identical* pathological state, as revealed by morbid anatomy). He would also be able to afford you as etymological a construction of the terms "*similia similibus*." As an illustration of the difficulties and perplexities induced by such confusion of terms, I may

remind the classical and historical "Vinclum" of the Arian controversy, which turned entirely upon the single syllabic difference in this very adjective, ὁμοιος:—the one sect persisting in the term ὁμωδυστος, as applied to the incarnation; the other as steadfastly adhering to the word ὁμοιωδυστος.

In the second place, a less learned investigator than "Vinclum" would have been able to ascertain that a "*plethoric condition*" is neither necessarily, nor even frequently, induced by "*rich viands*," nor dropsy by *drowning*, or by external saturation with water in any shape, unless such external saturation should operate in the same method as a draught of cold air, &c., upon a heated body, in repelling perspiration.

In the third place, it does not seem to strike our learned physiologist, how greatly his *viand cure*, as imputed to us, is at variance with the taunt fulminated by one of his colleagues, that the "*rationale of our treatment consists in strict dietary regulations*." And these are all palpable inconsistencies, which should have been sifted from the confused ideas of our disputants before they ventured to commit thoughts to paper, in registration of the very muddy condition of their reflective faculties.

Another gross misconstruction of terms occurs in the second article which "Vinclum" has issued to the world in the first flush of pride which plumed itself of authorship. Here he falls foul of the term "*specifics*," and with his co-disputant, A. S., flies off, in a fit of transient triumph, to seek for the meaning of the word in the advertisements of Professor Holloway, the Hygeist, Widow Welch, Parr, and others.

Now, all this is by the question; because the word certainly means something definite, however it may have been hackneyed and the very hackneyed use of it would imply that it *should* convey some sense of positive capacity to cure.

A specific remedy as regards any particular disease, is clearly one (and there are such, as is well known) which possesses the property of acting in the animal economy directly to the seat of organic lesion, so as to displace or extirpate the *origo morbi*.

Associated with this term specific, comes another, which is applied by "Vinclum" and his colleagues with equal lack of discrim-

nation and no less confusion of meaning,—it is the term *quackery*, which it is fashionable in certain quarters to fulminate as a *summary refutation* of Homœopathic verity.

With due submission to “*Vinculum*,” L. G. G., and A. S., therefore, I would also come to a definite understanding as to the meaning of this term, and I humbly conceive that the word *quackery* may be appropriately applied to the following therapeutic methods.

1. The employment of a medicine which is really specific to some phases of the disease against which it is employed, but *without a knowledge of the rationale of its operation*, and consequently without any definite idea of the means of accommodating its application to the variable conditions of idiosyncrasy, constitution, temperament, age, sex, &c. &c.

2. The employment of a drug, whether really specific, against any particular morbid condition or not, as a *general therapeutic agent against all varieties of disease*, as is now the case with the popular application of galvanism.

3. The employment of one or of many drugs promiscuously, simply upon precedent, *without any idea of the abstract properties of such drug or drugs as respects the animal economy*, and notably the use of purgatives, emmenagogues, diaphoretics, astringents, tonics, &c., &c.; and the employment of *compounded* medicines, in which an indefinite number of drugs are commingled to regulate one another’s operation—as is the case with the method of prescribing adhered to by the dominant or Allopathic school of medicine.

4. An interpretation which ought not to be admissible amongst medical men in the advanced stage of our physiological, anatomical, and pathological knowledge, but which is nevertheless too generally to be included, viz., the attempt to treat disease with any therapeutic agent whatever, without any sufficient knowledge of the physical sciences, which are indispensable to the true physician.

Admitting these to be true interpretations of the term *quackery*, Hahnemann and Homœopathy must be exempted from the imputation which it conveys; for neither did Hahnemann promulgate, promote, or practise, in any of the methods which I have described,

nor does Homœopathy, properly so called, acknowledge either.

The first great aim of Hahnemann in his self-devoted career of medical reform was to obtain, by patient, persevering research, an exact knowledge of the essential property of each drug, before he ventured to employ it in the treatment of disease. His learning and assiduity, honourably acknowledged by every contemporary whose reputation gave weight to his opinion, and his uncompromising purity of character, sufficiently attest the truthfulness of so much as he has recorded of his labours. None of the great pathologists of his time have ventured to gainsay what he alleged; and Hufeland himself paid an honourable tribute of acknowledgment to some of his important discoveries. As a physiologist, he was known to be inferior to no member of the profession at the period in which he flourished; to his chemical researches, Liebig and our own distinguished chemists are indebted for valuable information; his pathological knowledge obtained for him the most respectful attention; and as an investigator of disease he was known for his patient and careful diagnosis;—and in fact in no branch of physical science was he wanting.

On the other hand, the very uncertainty and guess-work treatment which “*Vinculum*” and his friends would bid us respect and pursue, falls witheringly under the *third* denomination of *quackery* which I have particularized; whilst the enormous abuse of mercurials, which had become the destructive *fashion* of medicine until Liston exposed its dangerous fallacies, is as seriously subject to the *first* denomination of *quackery* above mentioned.

Next, let us quit the war of words for a few minutes, and examine one or two other particulars, which are salient as absurdities palpable to the meanest intelligence, in the mis-named reasoning of our friend “*Vinculum*.” For lack of any originality of thought, poor man! he is driven to *borrow* ridicule at *second hand*, of that universal literary and scientific borrower and beggar, Dr. Pereira.

Now, to say nothing of the *matter*, I might have wished that he had *borrowed* at least of one whose *own* investigation was a matter of record. But what does he do? He plunges into the labyrinth of clashing opinion accumulated in Dr. Pereira’s “*Materia*

Medica," and like the plum extorted by the ingenious "Little Jack Horner," he digs up the worthy *compiler's* collectanea respecting "vegetable charcoal," and lavishes vapid satire on Hahnemann for having taken the pains of devoting "forty-five octavo pages to the effects of *carbo ligni*," which he, "Vinclum," sternly maintains, with the infallible authority to whose scissors-and-paste-pot labour he is indebted for his information, is an "*inert substance*." Ay, and the joke does not end here, for "Vinclum" not only borrows the information, but the very same vein of abuse, in crying shame on Hahnemann for recording, what to our critic's too sensitive and delicate notions is "*filthy and obscene*." Poor, pitiful creatures! Verily ye must have spent a great deal of time in the branch of your medical education without which you are good for nothing—the dissecting-room, to wit—that ye have grown so lady-like in your ideas of what a physician should record of the symptoms of disease, and of what he should *suppress*, forsooth, as "*filthy and obscene*!" Why, "Vinclum," you must have a rare hand to soil when some poor creature requires the use of the scalpel and its accessories.

But to the purpose. You *allege* that vegetable charcoal is an "*inert substance*," but can you assign any physical reason why it should be so? Is there any chemical or physiological impediment in the way which should prevent its producing certain abnormal conditions, as positively as mercury, iodine, colocynth, henbane, &c.? You hear that some one gave a dog a given quantity of crude charcoal, and that it passed through the animal without any trace of alteration or decomposition whatever. And *you* are satisfied with this simple, ingenuous statement; *you* inquire no further, but record the substance in your memory forthwith as *inert*.

But although *you* perceive no reason for further inquiry, Hahnemann did not; and although *he* did not record the *reason* to which he attributed the action of *vegetable charcoal*, under certain circumstances of previous manipulation, there is a reasonable hypothesis which I may venture to adduce on this subject. I only say *hypothesis*, for the *reason* is nothing more, whereas the *actual fact* of certain effects being produced is beyond a doubt—it is positively known. And my hypothesis as to the *reason* is this:

We have found that vegetable charcoal, compounds of silicon, compounds of lime and other substances, which resist the action of any chemical agency in the stomach, or, in other words, which are incapable of decomposition or solution in the juices of that organ, are *inert* in their *crude state*, simply because they are not subject to digestion, assimilation, or absorption, and that therefore they cannot operate (except as mechanical and local irritants) upon any organic tissue. Now this is the position maintained by the Allopathic authorities on "*Materia Medica*," and in this so far we precisely coincide. But we go further; we seek for means of rendering these substances capable of absorption; we comminute them by mechanical means, until after a given degree of reduction we find definite and invariable effects produced upon the healthy organism; and my hypothesis is to the effect, that the *absence* of effect produced by the *crude* material is attributable simply to its incapability of solution, or decomposition, and thereby of *acting* upon any vitalized tissue so as to disturb the atomic arrangement; whereas the *decided effect* resulting from its *comminution* arises from its having been rendered capable of introduction into the various arrangements of important tissues, so as to induce atomic disturbance therein. And this hypothesis will be found to coincide with the facts ascertained in physiological anatomy, and with the known construction of the various tissues, as well as the proverbial *slenderness of affinity which influences the molecular arrangement of all organic structures*.

A few words more. As regards the vituperative designations or coarse ridicule contained in the adverse articles of Messrs. "Vinclum," L. G. G., and A. S., as instanced in the lavish use of terms such as "fools," "frauds," "impostures," and the like, with which they teem, I need only observe that they are beneath the notice of men of science; and one *prima facie* evidence of the lack of scientific attainment possessed by our opponents in this discussion, to my mind, was the profuse aggregation of expressions such as these. Indeed, it was with some reluctance that I joined in the discussion on that account.

As respects the challenge unguardedly repeated by L. G. G., at page 50, that we should at once proceed to operate with our

drugs upon fifty sound individuals, I have but one remark to offer, and it is this:—that in the first place we are fully prepared, in any place and at any time, to accept the challenge, the experiment being conducted in the presence or with the cognisance of an impartial and honourable committee; but that it is not for *us* to select the patients, but for the *challengers* to do so, lest we incur the risk of being assailed in success with innuendoes offensive to our honour. And at the same time it should be reserved that those who become patients in such an experiment, exonerate us fully and freely from the consequences, as these would not be of the pleasantest character.

There do not appear to be any other objections raised in the negative articles which are worthy of notice; but as I commenced by disputing the interpretation of Homœopathic doctrine as put forward by "Vinclum," I feel almost called upon briefly to repeat the real construction which it bears.

First, then, it seeks the minutest evidence of disease, and makes the most accurate observation of symptoms.

Secondly, it looks for a medicine whose ascertained action upon the healthy organism yields evidences as *nearly analogous* to the symptoms of disease observed as possible. Or if our *single* medicine does not meet all the features of the case, it chooses that *first* which embraces the most important morbid manifestations, and allows that medicine to exert its action *undisturbed*, until from the *abidence of this most important* indication, some other *feature* becomes predominant, when it proceeds in like manner with that—and so on until the cure is complete.

Thirdly, and necessarily consequent upon the second principle of the method, it employs only *one unmixed* drug at a time; it never mixes several drugs together, because there is no means of ascertaining the direction of a complex action set up in the organism. The drug employed may be a *chemically* compound or simple body:—because *chemical* combination only produces a *different simple* and not a complex physiological effect.

Fourthly, it acts directly to the part or organ in the economy which is especially affected, because that is the direct way to a safe, rapid, and perfect radical cure, and because accurate research in the proper effect

of each medicine has definitely ascertained the organ or part especially controlled by each drug in the Homœopathic Materia Medica.

The *fundamental principle*, which is now acknowledged as supreme in every branch of physical science, is, that the *primary* action produced by any disturbing agent is only *transient*, whereas its *secondary* action is permanent; and that as disease consists in the obstruction of some functional process (whether from *relaxation* or *excessive* tension of the structure upon which such function depends), the true method of restoring the equilibrium is momentarily and very slightly to operate in the same direction, so that energy be artificially conveyed to the system to overcome such obstruction. But this fundamental principle also involves—

A *secondary question*—which is, to avoid an excessive aggravation of the disease, lest serious results accrue before the functional and vital reaction has taken place; and in this secondary question *infinitesimal physic* is necessarily implicated; so that in reality the method of practical application, to which the doctrine of analogies is inevitably subject, and which is the chief source of ridicule, is in reality the simplest and most palpable part of the business.

When we speak of a medicine being *specific* to the disease, we simply mean (and I really think a child would understand it so) that it has the property of producing an *assemblage of morbid evidences* exactly analogous to *all* those of the case under treatment, and that moreover we also know that it operates directly, and with especial energy, upon the actual organ, which is the seat of the *origo morbi*. See "Vinclum's" account of Homœopathic dogmata, and they would seem as childish and ridiculous as he wishes his readers to believe they really are, and taking such an account to be the true, it might verily be alleged that all who practise after this fashion had flung aside as useless the physiological, anatomical, chemical, and pathological knowledge acquired with vast labour in the schools; but I ask any reasonable and impartial man of real scientific attainment, if, when put in its true light, the doctrine which I have been advocating, far from being at variance with physiological anatomy and other branches of physical science, is not corroborated and confirmed in

the most clear and positive manner? It is *its merits*, associated with all the physical sciences. my own opinion that Homœopathy *rests upon* sciences. EDWARD GIBBON SWANN.

NEGATIVE REPLY.

THE question involved in the discussion on Homœopathy, which has been sufficiently extended to give the general reader a fair idea of the value of the arguments adduced on both sides, embraces two heads—a theoretical and a practical one. Anything which may have come from our pen has always been written with a view to exhibit, in their true light, not only the reasonings upon which this so-called science is established, but also to estimate the practical value of its therapeutic agents: we have endeavoured, as much as in us lay, to avoid the extremes into which our adversaries have too often fallen—of exalting either at the expense of the other, from a conviction that imperfection in theory must necessarily react injuriously upon the working out of any idea.

It is not fair, then, to object to any arguments which may be brought against the system, on the ground that actual experiment is the only way in which its claims can be tested, especially since, were results of this description wanting, which assuredly they are not, the very nature of the investigation, if logically conducted, cannot but lead us to the conclusion, that if Homœopathy be *not* true in principle it *cannot* be beneficial in practice, or *vice versa*. If, then, we have been successful in proving that the hypotheses upon which globulism is based are not consonant with the established laws of medicine, or with the experience of the members of that faculty, our position is maintained; nor do we hold ourselves necessarily bound to substantiate the latter portion of the question. But as it is possible that an exception may be taken to this mode of arguing, in giving a brief *résumé* of the facts of the case as they may be elicited from the various papers of our allies or our opponents, we will endeavour to show that Homœopathy has failed as signally when subjected to the *experimentum crucis*, as when tested by the equally searching laws of reason.

We shall not greatly err in looking to the motto of Hahnemann, "*Similia similibus curantur*," for an explanation of the prin-

ciples on which the Homœopaths vindicate their treatment: that this is a fallacy we have already shown, when applied universally as a panacea for every species of disease; the only grounds for the statement being the action of certain drugs upon the constitution, and of certain physical agents upon the nervous system, which are really subjects upon which our knowledge is, to say the least, very limited. We have effects presented to our view, we have the agents which caused those effects in our own power, but to trace the connexion between the two is more than we are able; the existing state of science does not permit us to supply the connecting links in the chain of inductive argument from what we do see to what we do not see.

It shows a deficiency of logical acumen to say nothing of actual ignorance of the but partial truth of this law, to construe hypothesis upon such a narrow basis, much more an amount of moral culpability which we will not estimate, when this hypothesis is blazoned about, and placarded in gigantic posters, in spite of all actual evidence to the contrary, and notwithstanding the notable false conclusions to which theoretically and practically it leads.

The question of specifics brought forward by G. V., betrays so egregious a deficiency of acquaintance with the commonest laws of medical science, that we will not again revert to it, but merely hint, that if the advocates of globulism have really relapsed so far into the dark ages as to sanction such absurdities as this, they effectually exclude themselves from any sympathy in the views and conduct which we might be inclined to afford men who erred on a subject which presented some reasonable ground for differences of opinion, and they may look in that case for such treatment only those in the rear of the great intellectual march can expect from their more advanced comrades—to be driven on with about as gentle means as the whipper-in of the Russian army was wont to employ when urged on the laggards by the use of lash.

But our opponents always shirk argument as to the reasonableness of their ideas; they feel their weakness on this point, and fly to the constant resource of the defeated: "Just try it yourselves," say they to the credulous public; "never mind what an interested profession may say; suppose our hypotheses be incorrect, we can appeal to the soundness of our facts." We, too, can appeal, but not to the generality of mankind, who are unable to judge of the value of cures, from their ignorance of the nature of the extent to which those cures are effected, and of the action of the means employed. We appeal from Philip in the dark to Philip in the light—educated and capable of conviction—to the properly constituted tribunals from which alone decisions on the point at issue are to be trusted; to men who have made the science involved the study of their lives, and who are fully qualified in every respect to test the comparative merits of the two systems. "We appeal," to parody the words of a great political chief, "to God and our profession," and by their decision will we abide.

We can, then, satisfactorily unveil the duplicity of men who ignore "the *a priori* absurdity of the system," and we shall then be able to show that "its practically beneficial character is not susceptible of proof."

What shall we say of the unblushing effrontery with which they* *falsify their statistics*, and introduce into their hospital reports, under the high-sounding names of *cephalgia* and *odontalgia*, those terrific affections, *headache* and *toothache*!

Must we not come to the conclusion that there is in "the lowest depths a deeper still"—that men who violate so systematically the laws of rectitude are not worthy of the confidence which we are accustomed to repose in those who have the care of our nearest and dearest interests, the lives and health of ourselves, our wives, and our children?

For it is to a question of ethics that they have ultimately reduced the discussion, and we fear not to take up the cudgels on this count also. When worsted on the practical value of their theory, they resort to the stale expedient of crying "stinking fish," and plead the constitutional peculation of the legitimate

sons of medicine as an excuse for the re-organization of the profession. We prove that their hypotheses are false, and we are told that the public are swindled out of their money; we demonstrate the fallacy of their arguments and the failure of experimental evidence, and we are instantly cried up as persecutors, and are preached to by these would-be Jenners and Galileos, as if we treated them with the merciless rigour of the inquisition.

We have seen, then, that upon no unvarying law of nature, upon no analogy of therapeutic agents, and upon no satisfactory theoretical reasons, can Homœopathy claim our suffrages as "true in principle:" that it is neither directly nor indirectly "beneficial in practice" we have also shown; it has been tested by the experience of its proselytes, and we find it impossible to depend upon their best evidence—by its opponents, and they have uniformly found it to fail. The very assertion, "that in no case can it do harm," is sufficient of itself to damn it; for is it possible that medicines which possess the slightest efficacy when rightly administered, could under totally different circumstances, and when injudiciously prescribed, be entirely inert? It is, in fact, attributing an inherent power of change to the different agents themselves; whereas we know full well that the varied action of any single medicament depends upon the nature of the organism to which it is applied, and that it is constantly evident that what is one man's death is another's cure.

We cannot, then, but come to the conclusion, that Homœopathy is either the result of ignorance or the work of duplicity; charity bids us suppose the former, but notwithstanding we cannot acquit many of its advocates of intentional collusion: to our readers we leave it, with the firm conviction that at no distant period it will have ceased to exist except in the brains of those unhappy individuals who seem to have realized in these modern times the character which Demosthenes gave the Athenians of old, and which was subsequently reiterated by St. Luke, who εἰς οὐδέν ἕτερον εὐκαιρουν, ἢ λέγειν τι καὶ ἀκούειν κοινοτερον. VINCLUM.

[At the close of this interesting and important discussion, we cannot but express our regret that any personality should have been introduced into it. Truth is never so convincing as when calmly stated and kindly enforced.—EDS.]

* Vide an able refutation of the fallacies of Homœopathy, by Dr. Routh.

Politics.

OUGHT MONEY TO BE INTRINSIC OR SYMBOLICAL ?

INTRINSIC.—I.

AN insight into the economy of social nature is the substratum upon which all politico-economic science must be based. The true political economist is one who possesses this insight in a profound degree. No matter how near may be his point of examination—no matter how artificial and modern the practical operations which he views—he is one who can trace near points to their remote foundations, and recognise the same elementary principles, guiding alike the infancy and manhood of political society.

Nor can this insight fail him in a question such as we have at present to discuss. Money—the common medium of exchange among nations—however intricate, through commercial advancement, in its nature and use, is yet dependent upon the same elementary laws which governed the earliest commercial exchanges of antiquity. As of old, nature distributes its benefits with an unequal hand; and now, as then, nations have their different natural productions. Art, moreover, the creature of man's own advanced powers, has grown and produced differently in different countries. Both nature and art, therefore, each work unequally. But, as of old, reciprocal wants exist. Hence commerce, also, exists as irrevocably now as ever; and its whole frame-work is supported by the same social necessities as obtained at the beginning.

In thus opening the present debate, we seek not to mystify the subject. We invoke for ourselves and readers the primary insight to which we have referred. If the true political insight of such theorists as Montesquieu and Smith, or of such practicalists as Horner and Peel, is denied us, let the subject be approached, at least, in the retrospective spirit which distinguished them. For certainly the currency question is one that cannot be discussed either theoretically or practically without a previous reference to its history. And although a coincidence of opinion may not result between all our readers and the political economists men-

tioned, whose leading financial faith, that money *ought* to be of intrinsic value, is our own,—yet they cannot deny them a purer love and nearer grasp of truth than distinguished a Law, a Mirabeau, a Robespierre, or an illustrious line of czars, whose financial doctrine and practice were, that money *ought* to be and *must* be symbolical.

But, as of first importance, let our terms be clearly understood. Money is a sign representative of the value of anything vendible; and, therefore, is necessarily in a manner symbolical. But the question is—Ought this sign to have a marketable value of its own, as gold or silver; or ought it to be comparatively devoid of all material value, as paper? Or, more comprehensively, Ought a currency to be one of intrinsic value, or one whose value is based on credit alone?

Now, the historical light cast upon the question is entirely one-sided. Apart from an examination of principles, history points to a unanimous and decisive affirmation of the necessarily intrinsic worth of money. The "iron pen of history" never wrote a more imperious truth on the minds it enlightened. Commerce was no less the birth of necessity, than *equal exchange* was the inborn commercial spirit. Anterior to the institution of money, the price of one commodity was another of equal value. And the adoption of a metallic currency as the common instrument of exchange, was owing to a happy combination of convenience and intrinsic value in the materials so converted.

Thus the guiding principle of commercial exchanges from antiquity has ever been to give value for value—not the mere nominal value of symbolical money for articles of merchandise, but the marketable value of an intrinsic money common over the commercial world. Of course, in the rude infancy of commerce, neither individual nor national stability and credit were such that producers could rest faithfully contented with slips of authorized paper-money in return for what had been the fruit of their

will and skill, and expect, too, to supply their own wants by exchanging them for other commodities. Nor down to the present time, with few exceptions, has a symbolical currency been attempted to be instituted. And these few exceptions the world will not hastily forget. The "continental money" of the American War of Independence made ruinous havoc. But the assignats and mandates of French revolutionary cupidity and terrorism—money truly the symbol of national bankruptcy and anarchy, and instrument of other than commercial exchanges—left the deepest and most indelible records. And even in Russia, where the currency is of all European nations at present the most symbolical, the monetary signs afford as little encouragement for a widespread example. Indeed, iron despotism and symbolical money flourish best together, the latter being the natural sequence of the former.

But ours is a theoretical discussion. What *ought to be*, we know, is not always identical with what *has been*. Yet the true theory of the currency can only be that which practice has taught us. The world's experience in this question is immeasurably before the *beau idéal* of either theoretical or practical speculators. A symbolical currency is just such a *beau idéal*. It only exists in the impracticable minds of mere theorists, or in the sinister wishes of speculative adventurers. Theirs is not an inductive theory; it is baseless as to facts. While the theory of a symbolical currency is one anterior to practice, and independent of past commercial history, that of an intrinsic currency is posterior to practice, and is the indoctrinated reflexion of the commercial spirit from its birth. It is for our readers to adopt a theory based on political nature, or one utterly alien thereto.

And passing from the historical part of the question, we find our position none the less invulnerable. It is apparent that a credit-system of currency would be a practical denial, not merely that trade has its own natural laws, but that it ought to be regulated by those laws, and not by arbitrary state enactments. Now, the intrinsic worth of money flows from a natural law of trade—equal value for equal value; and regulated by that law, money is given in exchange for commodities. But this truth is abrogated by

the institution of symbolical money. Surely, now-a-days, the great fact, that the principles of commercial exchanges are irrelative to the principles of state government, requires no proclamation. And surely no truth-seeker can disbelieve, that the more trade is free from state control, the greater is its certainty of development. But what must be thought when money is of such a nature, that, instead of being of an equally universal intrinsic value, it has an unequal nominal value over the commercial world? Based on credit, a symbolical money is of value proportionate to the credit of issuers. Governments must ever be the real issuers, although banking corporations may be their agents and tools. Hence, as amicable foreign relations wane, the value of symbolical money must wane also; and as open hostilities between states are declared, the banking governments lose all monetary transactions with their foes, since a cessation of diplomatic relations is little else than a declaration of want of confidence. And would not trade consequently be trammelled and stunted in its development? Why, taxes on the importation of commodities by any government would far less bondage trade than the origination of an arbitrary instrument of exchange of nominal value, subject to all the fluctuations incident on the ebb and flow of state policy and the distrust of friends. Certainly, if the commodity must have free importation, the instrument for which it is exchanged ought to have a similar freedom.

But a purely symbolic money is nowhere *un fait accompli*; nor, as we have indicated, is it ever likely permanently to become so. Therefore, on the advocates of a credit-system rests the *onus probandi* as to the justice of its institution.

A symbolical money, it will content us at present to say, if ever existent, would be partly, perhaps wholly, distinguished—1, by its arbitrarily representing saleable things; 2, by its merely nominal value; 3, by that value being national or local; 4, and dependent on the credit of issuers; 5, by its fluctuating with the rise and fall of things represented; 6, by its too direct influence (proportionate to the confidence or distrust in government or corporational credit) in raising and depressing the springs of production; 7, by its being an investiture of most despotic power in governments or cor-

porations, by which public interest might be sacrificed either to political ambition or corporational greed.

We think our readers, without much difficulty, will now admit, that the first essential quality of a circulating medium must be an intrinsic marketable value. But they must not hence suppose that they are thus pledged against the use of a paper money, having apparently no such value. On the contrary, a paper currency is a useful auxiliary to a metallic currency. A paper money is the consequence of multiplicity of metallic money. It is because of its convenience as to transportable facility, its economy in preventing the wasting of coin by use, and in lessening the heavy expense of a great metallic circulation, that an auxiliary paper currency is allowed. As coins are the representatives of mercantile commodities, so notes are the representatives of coins; and as metallic money is a permanent representative of the value of those commodities, so a paper money is the temporary representative of the value of metallic money. But when once symbolical money exceeds in nominal value intrinsic money, the public are defrauded, while the banking corporations are enriched. Paper money deteriorates, or if credit is great, coin rises exorbitantly

in value. To this fact is owing the immense control acquired by government in regulating banking privileges, and their influence over the money market, not merely in controlling paper issues, but also in manufacturing promissory notes on the security of their credit, which have rarely, if ever, been redeemed. Hence arise bubbles, money panics, and national insolvency—the result of a disobedience to the law, that money must have an intrinsic marketable value. If these evils flow from a symbolical money on a small scale, how much more would they exist under an unlimited system of symbolical currency?

But we have entered far enough, at present, into the question, and will at once conclude, by predicting that the result of the present discussion will be an agreement between most of our readers and Baron Montesquieu, in the unbiassed opinion, that “the state is in a prosperous condition when, on the one hand, money perfectly represents all things; and, on the other, all things perfectly represent money, and are reciprocally the signs of each other—that is, they have such a relative value that we may have the one as soon as we may have the other.”*

R. L. G.

* “Esprit de Lois,” book xxii. chap. 2.

SYMBOLICAL.—I.

THE great difficulty of modern statesmanship is, to reconcile the rights of labour with the rights of property, and every legislative effort to solve the political and social problem has hitherto proved unsuccessful. The failure seems to have arisen from bestowing undivided attention on matters of detail, while great principles have been neglected. Remedial measures have skimmed over the surface of the troubled waters, but the plummet of reform has not yet sounded their depths. The hours of labour have been restricted, without going into the question, “Why cannot labour dictate terms to capital, instead of capital to labour?” Emigration has been systematized and encouraged, without opening the question, “Why do Englishmen and Irishmen leave their native country by hundreds of thousands every year?” Sometimes distressed needlewomen rouse the sympathies of the nation; then the tailors, then journeymen bakers,

then workers in mines, then governesses, then chimney-sweeps; but the law of cheap labour, which manifests itself in these various shapes, is not boldly met and discussed. Free trade was the last experiment; but for so energetic and revolutionary a measure to bear such small and questionable fruits, indicates that the root of political evil is not yet touched. Free trade has shown itself to be an imperfect measure, from its mixed operation of good to some interests, and evil to others; from its injurious effect on the cultivators of the soil, its *utter abnegation* of the colonial system, and from its unscrupulous disregard of a *great principle*, that *taxation must be added to price*. An intelligent body are advocating education, but these well-intentioned men would find by experience that a *previous question* must be settled before education can bear its proper fruits, viz., *the condition of England question*, or the *question of employment for the people*.

The employment of all! Why is not every man employed? Because the supply of labour is greater than the demand. Why is the supply greater than the demand? A hundred answers present themselves to the minds of your various readers. I would answer it at once, and boldly—because there is a want of *money*; because this nation is insanely tied down *illimitable* production to *limited money*, instead of allowing money to keep pace and expand with production. We have made gold, a scarce metal (the happy consequences to arise from its recent almost miraculous plenty will be touched on hereafter), our money; and *money* being *legal tender*, that is, the only instrument which the law recognises as a legal discharge of debts, taxes, and wages, and all production being resolvable into this money, such production is *dear* and arrested by money's comparative scarcity: for I lay it down as an axiom, that much production, or many commodities and little money, is cheapness, and cheapness is unremunerative price; and unremunerative price is depressed trade, languid demand, and intermittent employment of labour. Cheap commodities mean dear money: cheap money means dear commodities. I advocate cheap money: I wish to see commodities dear. Gold is a *dear money*: to it I trace all our commercial evils. I would abolish gold money, which is money of *intrinsic* value, and would substitute paper money, which is cheap money, and for the following reasons:—Because money is in its very nature *representative*, as a bill of lading is representative of a cargo. Any man holding a bill of lading, though only a piece of paper, is deemed to be the owner of the cargo worth thousands, representative, like the penny postage stamp, which in itself, though not worth the hundredth part of a farthing, is nevertheless representative of the potentiality of carrying a letter from Dover to Galway, and would be taken by any one as the representative of the copper penny.

Let me dissipate an erroneous idea which prevails the minds of all those who have not paid attention to this subject. A bill of exchange is *not* money; it is only a promise to pay money; and in times of *panic*—the touchstone of our system—is convertible only into gold, or its certificate, Bank of England paper. Panic means this—that

bills of exchange go for gold, and the gold not being in existence, perhaps having gone into a foreign country through the operation of the exchanges, the holders have to submit to *enormous sacrifices*, which means, they have to pay high premiums on gold, which means a *high rate of discount*. That money should be *symbolical*, and not have *intrinsic* value, I will attempt to prove by another argument: and here let me say, that if we are to make a *commodity* into *money*, no commodity is so convenient as gold: but my argument is, that *no* commodity can make a money; for money is merely a *shadow*, and should increase with production and disappear with consumption. As soon as a pair of boots are made, the money should come into existence; as soon as the boots are sold, the money should disappear. To make this assertion good will require another paper, and I wish it to go for no more than an assertion at present. But my argument is this:—If a commodity can make a money, then gold, being the most convenient, can make a money, and we then insist that the bullionists carry out their principle and give us a *gold* money—a money of gold (allowing silver as small change), and *nothing* but gold. Don't eke out your system by resorting to one *symbolic money*. Gold, gold, nothing but gold. If a merchant has a thousand pounds to receive, let one of his clerks follow him with a wheelbarrow; let every man see that his pocket is well sewed; let your leather bags be capacious; let the worship of Mammon be sincere and undivided. Do not recognise flimsies, put away far from you dirty rags. Above all, the *fourteen* millions of debt which the nation owes to the Bank of England, and which is issued as *paper money*, without any *base* of *gold*, must be withdrawn, and let the panic come on. If your principles be sound, adhere to them, and never fear the consequences.

Another argument against gold money is this—and if I make my case good against *gold*, I make it good against all *intrinsically* valuable money, because gold is the best of commodities, if we are to have a commodity—namely, that the proper weight of a sovereign is 5 dwt. 3 grs., and that sovereigns are coined to that weight and no more. But, unfortunately, if the sovereign, in being transferred from one bag to another, from one pocket to another, from the opera-

tions of the sweater—who is as naturally the product of gold money as vermin is of filth—from the abrasion of one coin against another; I say, if the sovereign loses one thousandth part of a grain, it is not longer legal tender; the government refuses it for taxes, the banker throws it back to you, with a supercilious air, over the counter, and you find yourself with a piece of bullion certainly, (and what is the value of bullion *now*,

after Californian and Australian discoveries!) but without money. Your only alternative is to take your piece of bullion, which was only coined last week, and with it go to the cambist and pay him a heavy per centage to find you a coin of the proper weight.

If a thing is wrong in *principle*, it is wrong in *all* its *details*. There is not a detail in gold money which is not objectionable.

J. H.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—V.

"Homo" tells us that wealth is being monopolized by the few, and that the labouring classes, from unprecedented hardships, caused by the introduction of machinery, are sinking in the scale of social being. We wonder "Homo" should have propounded two such heresies, contradicted alike by history and individual experience. Competition is opposed to monopolies of every kind; this is its prime recommendation. The guilds and corporations by which monopoly sought to perpetuate its existence are yielding to competitive influences; and our working men, so far from degenerating, are earning for themselves niches in "Fame's proud temple." Surely evils enough exist in society without resorting to fictitious ones to swell the amount.

From "The Age and its Architects," "Homo" quotes a very forcible statement of evils, which partially, at least, do exist in society; even in that statement, however, co-existents and consequents are confounded. It cannot, for instance, be proved that the two million paupers, criminals, and vagrants, are chargeable to the influence of competition. The evils which are attributable to that cause are the purchase-price of our advancement; and we hesitate not to say, that rather than endure the sluggishness to which Communism would reduce us, we would infinitely prefer the present state. What, after all, but competition, could have brought our mechanic-arts, our manufactures, and, above all, our literature, to their

present enviable condition? It is an every-day observation, that rivalry draws out the latent energies of the mind; but by removing this, the Communists would remove the very element which has contributed so signally to liberalize the intellect, and would render the community a realized Castle of Indolence.

"Homo" would have done more eminent service to his cause had he devoted himself to a refutation of our statement relative to man's attachment to private property, than by asking whether a mere attachment conferred a claim to possession. We think the inference was plain, that where all manifest attachment to private property, all, when they have a choice, will adopt it. This inborn attachment to private property must render nugatory every attempt to establish universal Communism; handfuls of men, moved by the same impulses, and actuated by the same principles, may agree to sacrifice that inborn attachment for a greater good, and may establish small communities, but the same can never be predicated of men in nations; it is impossible to inspire them with that unanimity of object and that subordination necessary to the evolving of the Communistic idea: this, in the words of I. F., would imply a "total renovation of human nature and usages." In confirmation of the opinions we have enunciated on this subject, we quote the following luminous remarks from a review in *Chambers's Journal* of one of Carlyle's "Latter-day Pamphlets." "In this essay, if he (Car-

lyle) makes any positive suggestion at all, it is, that nations should be governed by an aristocracy of wisdom, 'captains of industry,' real, not sham rulers. 'The few wise will have, by one method or other, to take command of the innumerable foolish.' Very good as a proposition in the abstract, but how are we to get at these Solomons? how to ensure their due succession, once we have begun with them? and, above all, by what practicable means are we to induce the 'innumerable foolish' to become the docile and obedient flocks of these sagacious shepherds? Until Mr. Carlyle favours mankind with a business-like recipe how to catch heroes and set them to work, and more especially how to catch masses of people and indoctrinate them with a feeling of obedience, nations to all appearance must be content to jog on with their present plans of government, and make the best of them."

But to return to "Homo." Unless he is prepared to deny that the fear of want and the desire for supremacy are the motives by which men are actuated, he makes out no case in favour of Communism. That degree of development is still a long way off in which conscience and reflection shall be the sole motive-sources; and until we reach that degree, Communism must remain an unrealizable theory: the fear of want and the desire for supremacy will clamorously interpose to prevent its adoption. But for the sake of argument, let us suppose the stage in man's progress anticipated by "Homo" attained. As that state is the very highest to which it is possible man, as man, can reach, it is clear Communism would be impotent to effect any further improvement—innovation could make no advance; besides, a system which had led to a result so happy, ought not to be abandoned for any merely problematical good. We may remark, that if the constitution of the present social form were theorized on, it might be rendered quite as attractive as Communism, and far more rational. Social theories, when reduced to

practice, lose much of their fair proportions. Its superior reasonableness is the only claim of the competitive state on our sympathies. We believe private interest to be as necessary to the existence of society, as gravitation is to the existence of the material universe. We admit that the Communist's system of social organization, on a cursory view, appears a feasible scheme; we are, however, satisfied, from a close investigation of the subject, that it is impossible for man, at his present stage of progress, so to abstract himself from his private interests as to render it practicable, and that were his nature so far perfected as to admit of its being reduced to practice, it would fail to enhance or to perpetuate his happiness. The evils of the present social state, so far from being aggravated, as "Homo" would have us believe, are being gradually eradicated; they are working their own cure; men are seeing it to be their interest so to control the competition existing among them, that it must soon assume a milder form.

As there are some points of resemblance between Communism and Louis Blanc's organization of labour scheme, we may be pardoned for alluding to it here. The cause of its failure was this. All the workmen were equally paid; the only guarantee sought to ensure their hearty co-operation being the principle of honour; but, quite in accordance with the principle laid down in Negative Article II., it was found that, for want of strict surveillance, the less skilful workmen trifled away their time—the others, exasperated at the unfairness of these loungers, abandoned the scheme in disgust.

As we are not likely to have another opportunity of writing on this subject, we take our leave of it, in the fine words of Cowper:—

"Farewell, all self-satisfying schemes,
All well-built systems, philosophic dreams,
Deceitful views of future bliss, farewell."

J. N.

AFFIRMATIVE ARTICLE.—V.

THE ability of Communism to promote the happiness of man is not necessarily connected with the question of the abstract, right or wrong, of private property. The contrary is a mistake of some of its sup-

porters, who needlessly thus open up an abstract argument, which, under the terms entitling the present discussion, might be left undecided. We are not discussing the right of private property, but the ability of

common property to promote human happiness.

What source, then, is there of human happiness so sublime and sacred as that of religion—as that of the venerative association of the will of man with the will of God—bringing heavenly harmony to earth? What form of faith, also, is so reverend in its recognition of this as that of Christianity in its purest acceptation? And what theology so established by internal evidence, so perpetually the pioneer of progress, so consonant with the highest culture, as that of the teachings of Jesus? As the religion of Christ, then, is admitted as the highest source of human happiness, temporal as well as eternal, all discussion among its disciples, as to the promotion of human happiness, should evidently commence with the consideration of how far any proposed plan for promoting the happiness of man was accordant with Christianity and sanctioned as a duty of religion, or work of piety and virtue. First and foremost, thus, we should inquire whether Communism is accordant with Christianity, and whether, therefore, it is a religious duty or worthy work, if we would truly test its claim to the title of a principle promotive of the highest human happiness.

Christianity is shown to be in accordance with Communism from the evangelic narratives. Christ himself appears to have had no personal possessions—not even a domicile of his own. He was entertained by his friends and disciples, and ministered to of the substance of others. By his precepts he proclaimed the true wealth to be that of spiritual possessions, not things for the body; and showed the impossibility of serving two masters—Mammon and God. By his actions he showed that universal love, which is the spiritual counter-part of material Communism. The whole design of his life was the individual manifestation of that which should become the example of collective humanity. That he himself might not have organized collective Communism (for we cannot absolutely say that he did not do this), is humanly accounted for by the brief period of his ministry, by the preliminary necessity of preaching his doctrines, and by the fewness of his followers previous to his death and resurrection. However this may be, that he nevertheless

preached the spirit of Communism is clearly to be inferred from its being the first form which his faith took—from its being the organized condition in which his church was originally constituted. Immediately after his ascension, we find assembling for prayer his chief male and female disciples (probably about thirty in number), and learn that they abode together in one house. That at this time all Christ's disciples dwelt thus in common, does not, however, necessarily follow. Soon after Peter addressed about 120 persons, then the number of the disciples, but with whom, of course, the degree of faith would determine the extent of duty. We gladly admit thus, that Christian Communism is not compulsory, but voluntary—not outwardly forced, but inwardly constrained. The case of Ananias and Sapphira further evidences this. That, however, which may not be physically enforced, may still remain a moral duty and pious performance. Hence the praise of Barnabas, who sold his property at Cyprus and distributed to the poor. Hence from Ananias none was required or all. Thus, after Pentecost we find some three thousand souls who continued steadfastly in the apostles' doctrine and fellowship, and in breaking of bread and in prayers; and we learn that "all that believed were together, and had all things common; and sold their possessions and goods, and parted them to all, as every man had need." Still later in the record we read, that "the multitude of them that believed were of one heart and of one soul; neither said any that ought that he possessed was his own; but they had all things common."—"Neither was there any among them that lacked: for as many as were possessors of lands or houses sold them, and brought the prices of the things that were sold, and laid them down at the apostles' feet: and distribution was made unto every man according as he had need." Such were the acts of the apostles; and after reading these, all must surely admit that the first Hebrew Christians constituted a Communist church, and that it is so far, at least, fairly proved, that Christianity and Communism were primitively connected and accordant, and held mutual relations to each other, like those of soul and body.

It may be objected, however, that such a state was designed only to meet the peculiar

circumstances of the Jerusalem church; and that thus it was confined, by temporary and local limitation, from the practice of the church at large. This objection is evidently without the support of analogy. The commencement of a religious system is generally the pattern of its extending course. The truth is, that instead of Communism having been locally limited to the Hebrew church, it was circumstantially impossible in the first foundation of the Gentile churches. The Hebrew customs had already recognised the liberty of the Essenian communities before the coming of Christ; but the laws of the principal Gentile nations were jealously and violently opposed to the admission of the right of association, as an *imperium in imperio*. Still the spirit of Communism, although the full form was impossible, was zealously inculcated during the apostolic period among the Gentile converts as well as the Jews. The Diaconate, indeed, was instituted, to superintend a fair distribution of the common stock between the Gentile and Hebrew widows in the Jerusalem church itself. Hence, also, the frequent appeals of Paul and Barnabas on the generosity of the Gentiles, to send assistance in support of the Communist church in Judea. Thus St. Paul declares, "Let no man seek his own, but every man another's wealth. * * * For the earth is the Lord's and the fulness thereof." Not further to multiply extracts, let the reader especially refer to Paul's description of the members of one body in their several relations, and to his beautiful definition of equality, both addressed to the Gentiles, as evidently perfect expressions of the spirit of Communism. Well, also, both as to Jew and Gentile, does John Wesley answer the objection, that christian Communism had only a temporary character. "To say," he writes, in his commentary on the communion of goods, recorded in the Acts, "that the Christians did this only till the destruction of Jerusalem is not true, for many did it long after. Not that there was any positive command for so doing; it was needed out, for love constrained them. It was a natural fruit of that love wherewith each member of the community loved every other as his own soul. And if the whole christian church had continued in this spirit, this usage must have continued through all ages. To affirm, therefore, that Christ did

not design it should continue, is neither more nor less than to affirm that Christ did not design this measure of love to continue."—"I see," he adds, "no proof of this." In this conclusion we most cordially concur. History supports, moreover, Wesley's brief remark, that the primitive christian Communism continued long after the destruction of Jerusalem. At Pella, the christian Zoar, it was continued in practice, and from thence was received by the Nazarenes and others, with whom it may be traced downward to the fourth century.*

Leaving the apostolic age, and passing to the patristic period, we first find many testimonies to the consonance of Christianity with Communism from the writings of the fathers. St. Clement says: "Brothers, the usage of all the things in the world should be common to all men; but, alas! iniquity has caused one to say, Behold my possessions! and another, Behold mine! and it is thus among men that private property was established." In the General Epistle of St. Barnabas, a work probably of this period, it is also declared: "Thou shalt communicate to thy neighbour of all thou hast; thou shalt not call anything thy own; for if ye partake of such things as are incorruptible, how much more should you do it in those that are corruptible?"† St. Benedict, of course speaking only in reference to moral authority and doctrinal duty, thus strongly declares, "None should have property. All things, as it is written, should be common to all, nor should any one assert or presume anything to be his." Trenæus likewise writes: "Whereas the Jews consecrated a tenth, they who live under the liberty of the gospel give all to the Lord's use." St. Ambrose declares: "Nature has given all things in common to all men. Nature has established a common right, and it is usurpation which has produced a private claim." Justin Martyr writes: "We who loved nothing like our possessions, now produce all we have in common, and spread our whole stock before our indigent brethren." Tertullian adds: "We Christians look upon ourselves as one body, informed as it were with one soul; and being thus incorporated

* Consult Eusebius, Hist., iv. 4; Gibbon, vol. ii. p. 274, *et seq.*

† Horne's "Apocrypha," ch. xiv. ver. 10. 1821.

by love, we can never dispute what we are to bestow upon our own members; accordingly all things are in common excepting our wives."* The same father also writes in his address to the Gentiles:† "Brethren we are, even of your own, by the law of Nature our common mother, although ye have little claim to be called men, because ye are bad brethren. But how much more worthily are they both called and esteemed brethren, who acknowledge one Father, that is, God; who have drunk of one spirit of holiness; who from the womb of common ignorance have come forth into the one light of truth. . . . Therefore, because we are united in mind and soul, we do not hesitate to have our goods in common." The practical bearing of this teaching becomes evident in relation to the conventual life, in the words of St. Jerome, who writes: "It is apparent that the church of believers in Christ at the first was such as monks endeavour to be now; that nothing in property is any man's own, none rich among them, none poor; their patrimony is distributed to the needy." St. Bernard, likewise, in his address concerning the Templars, writes: "That nothing may be wanting to evangelical perfection, they dwell together without separate property of any kind, in one house, under one rule, careful to preserve the unity of the spirit in the bond of peace." From these testimonies, then, we may gather, that in the patristic period Communism was deemed so accordant with Christianity, as to be inculcated as a moral duty, and as a point of religious perfection. As a consequence, the conventual life arose first in the east and then in the west. With the celibitary and superstitious defects of the monastic system, however, our argument is not concerned. It has simply to regard that system, imperfect in itself, as one of the links in the chain of proof, that Communism is accordant with Christianity.

If after this period we turn and observe the condition of the eastern church, with a view to the consideration of this, we find the conventual life extensively established, a system of clerical colleges in operation, stewards appointed to manage the landed property of the church; and we read of

Basil and his Basiliade—a christian Communist city; and of the opinions of the Montanists, Circumcellions, and other non-conformist sects, on property, debts, and slavery.* We prefer, however, following the route of Rome, as the usual track to modern times.

The church of St. Peter, like the other churches of the Gentiles, though from many causes it did not practise the full communion of goods, has yet decisive circumstances in its early history which indicate a perception of the Communist constitution of Christianity. At first, by Roman law, the christian church was incapable of holding landed property in common. To this effect several statutes existed, which, like our law of mortmain, were enacted to prevent any real estate from being given or bequeathed to a society or corporate body without special licence. With the decline of the empire, however, the severity of these statutes relaxed, and before the close of the third century large estates were bestowed and possessed by the churches of Rome, Milan, Carthage, Antioch, and Alexandria. One of the laws of Constantine was especially effectual in this respect. This was a law which expressly secured to the church the right of receiving legacies. Gifts to the church were neither bequeathed nor received thus for the private purposes of ecclesiastics, but for the public use of the church in its general capacity. Thus in the Canonical Institutes of the Emperor Ludovicus Pius, A.D. 800, it is written:—"The goods of the church are the offerings of the faithful, to assist the suffering, and as the patrimony of the poor." Prosper, also, adds his testimony in these words: "Holy men did not receive the goods of the church as private property, but as given to be shared among the poor." He further writes, "Whatsoever the church hath, it hath in common with all such as have nothing." This is assuredly a proof that in the chief Gentile church the spirit of Communism at first prevailed as it had done before at Jerusalem. The causes of the decay of this spirit—chiefly the imperfect communitive constitution, and the embezzlements of ecclesiastics—are beyond our argument, which will now briefly draw to a conclusion.

* Women, no more than men, can be justly accounted property.

† "Ad Nationes," chap. xli.

* Neander, "Church Hist.," vol. iii., *passim*.

Throughout the course of our considerations we have argued that the accordance of Christianity and Communism is proved from the evangelic narratives, and from the constitution of the primitive church at Jerusalem. In support of this, we have adduced the venerable testimonies of the patristic period, and brought forward the practical traditions of the church for several centuries, as illustrative of its truth, and partaking to a considerable extent of the spirit of Communism. Thus we have generally gathered, that Communism, as related to Christianity, should be regarded as a moral obligation and meritorious work.

On these deductions, then, we base our first and foremost argument in favour of Communism, as a principle promotive of

human happiness. The richest realities of enjoyment are those of religion. The self-satisfaction of conscience, in the performance of a moral duty, is a heaven within the soul. Deeds of duty and devotion not only bloom here below, but also bear fruit on high. It is human to claim a right; it is divine to perform a duty. Communism, then, as an obligation of Christianity, as a duty of religion, must be in the highest degree promotive of human happiness, temporal and eternal. No higher name than that of Christ exists among men. Religion is our noblest, truest enjoyment. On the sacred pleasure derived thus from the performance of a religious duty, do we trace our first argument in favour of Communism as promotive of the happiness of man. G. B.

The Societies' Section.

EUROPEAN PHILOSOPHY.

BY THE AUTHOR OF "THE ART OF REASONING."

PROLOGOMENA—(*Continued.*)

THAT singular potency by which, through the consentaneous unfolding of their inherent and natural activities, the cognitive faculties conform to complex and intricate intelligential laws, and thread the labyrinths of involved and subtle formulary processes, unconsciously and, as it were, by the mere force of those irresistible impulses which co-exist in the structural elements of mind, is, perhaps, one of the most remarkable facts connected with the "philosophy of the intellectual powers." Man is, at first,

"The adoring child
Of Nature's majesty, sublime or wild;
Hill, flood, and forest, mountain, rock, and sea."

It is only gradually that Egoism or personality becomes developed. The externalities, which everywhere he turns impinge their impressions on his senses, monopolize all the earlier exercises of his faculties. The severance of this synthesis of the Ego and the Non-ego—the sundering of the mentality from the objectivities without and beyond—the assigning of a protensive existence to the phenomenal universe, and the realization of the idea of Self, are processes of thought requiring time for their fulfilment.

"Like the moon struggling through the night
Of whirlwind rifted clouds,"

are the early prefigurations and obscure preludes of man's conscious existence; but at length these "glances of soul-dissolving glory" become continuous, and consciousness, emerging from the cloud-haze, seems like

"Yon crescent moon, as fixed as if it grew
In its own cloudless, starless lake of blue;"

the *Mind* differentiates itself from *Matter*, and man regards himself as a "nursling of Immortality."

But although we assert that the mind is thus unconscious of the intricate thought-processes through which it passes in its earlier stages, it is not to be inferred that we believe that the mind is inactive and quiescent—a mere passivity. Our minds are *not* mere note-books of facts. The human soul is not a lake in whose placid bosom are envisaged—in shadowy though slightly confused beauty—the innumerable objectivities of the phenomenal world. It is endowed with a constructive, truth-disintegrating power, by which man is enabled to become "the interpreter of nature"—the analyst of phenomena—and the co-ordinator of all the ideas derivable from the external world into one organic whole, interlinked and knit together by the formal power of the Reason. The mind-germ, which is man's birth-gift from the Creator, does not grow by the mere accretion, successive and gradual, of idea-eliciting phenomena, but by the digestion, absorption, and assimilation of the facts of phenomena into the thought-system as the nutriment of his mental energies—the constituents of Theory and Science and the elements of Truth—the immortal melody of heaven.

We know that it is one of the current "cants" of the time, that "the age of Philosophy is gone." The reign of Positivism is established, and Metaphysic is a crownless queen. The abstruse, the visionary, the impracticable, the intangible, the shadowy, "have vanished to return not." Woe unto us if it be so! Is man an insoluble problem to himself? Must humanity ever feel the burning wish to be revealed into itself and be for ever answered by negations? Must man never be released from the burden and the mystery of speculative thought? Is self-knowledge unattainable? Must it ever be a "vain endeavour" to aim at learning

"The nature and the science of our being?"

Are the sage's precept, *Γνωθι σεαυτον*—"Know thyself," and the scriptural command, "Examine your own selves," impossible tasks? Are those aspirations which have been implanted in the glorious intellect of man, stimulating him to inquiry regarding the uses of those marvellous powers with which he is endowed and the destiny which is before him, purposeless and vain?

"This intellectual being—those thoughts that wander through eternity,"

can they be ignored or forgotten? Is it supposable that man should be able to harness steam like a mechanic drudge to execute his labour—dissect the rainbow, and from that type of uncertainty and evanescence learn "the laws of light"—lay his hand upon the Ocean's mane, and bid it bear his "oak leviathans" through the mighty "yeast of waves"—measure heat, and apply it to purposes of practical utility—employ the "thunder-footed" Electricity as his tidings-bearer—cause the light of the elusive sun-rays to act as the pencil of an artist—dive to the ocean-depths amid the tumult of the boiling waters to lay the foundation-stones of stately fabrics—glean a knowledge of the laws of crystallization from the fitful snow-flakes in a winter storm—build up the splendid system of geometric truth—read the narrative of creation's early vicissitudes in the rock-masses of the Andes and the Alps—

"Unwind the eternal dances of the sky,"

and construct that vast system of experimental and positive science on which the practicalists of our era pride themselves—and yet be unable to unswathe the adjunct and the accidental from the mentality, and thus approximate to a solution of the problems of the Reason? No!

“ ΠΡ. οὐ τὰντα ταύτη μοῖρα πῶ τελευσφόρος κρῖναι πέπρωται.” *

Do we, then, believe that Philosophy is possible? Assuredly we do; and if you favour us with your attention, we shall occupy the present paragraph with an attempt to prove that it is so. Philosophy can only be possible through the objectivizing of the mind, i.e., by our being able to look upon our mentality in an experimental manner. Now, when we analyze human knowledge into its ultimate elements, we discover that Self + our perceptions, form the apparent sum. But does not this very analyzation prove the existence and reality of a power of viewing Mind as an object? Does it not necessitate the conclusion, that there is a primal cognitive power by which the impressed *Self* is revealed? If it be not so, how is our self-identity made manifest?—how are we able to differentiate the Ego impressed from the impressions made upon the Ego? No one can, we think, gainsay the accuracy of the inference, that, before the gorgeous scenery of external experiences could become cognoscible by the mind, there must exist within it an exquisite apparatus of vision which, holding, as it were, a central position in the intelligence, receives the radiations which are sent forth from “all objects of all thought,” and which is subsequently enabled, by employing the animal faculties as its agents, to go forth aggressively into the world of phenomena, and acquire a knowledge of the meaning and significance of the manifold and magnificent wonders which are observable in the protensive universe. But superadded to this, must we not also predicate of “the vision and the faculty divine,” that it possesses the more singular potency of measuring out and consecrating what of the microcosm within constitutes our personality, i.e., of forming the notion of Self? This *Selbstbewusstseyn*, as Kant calls it, i.e., the becoming aware of one’s own personality, or as our own philosophers denominate it, Self-consciousness, is the condition of all knowledge. By the eye of Consciousness alone are all our perceptions realized. The various modifications of the mind, its feelings, sensations, perceptions, thoughts, volitions, &c., are observed by it, exactly as the various members of the body and the functions they perform are seen by the eye. There can be no experience without knowledge, neither can there be knowledge without a mind, and, consequently, a knowledge-perceptual agency in that mind. It may not be easy to institute a self-inquisition so rigid and minute as shall enable us to force our way into the profoundest recesses of our soul, and gather information regarding the obscurest mysteries of our being; but we are persuaded that by a strenuous *intension* of the mental vision the fact of the existence of this self-apperceptive power will be made manifest. Not that it can see itself, any more than the bodily eye can witness its own operations, but that its existence may be legitimately inferred from the facts of which it is the revealer. It is true that it is difficult to trace out the distinct in the unical—to demarcate the definite part in an inseparable whole—to distinguish without the desire to separate and disjoin—to perceive the accurate boundaries of an element of thought, which, while it is *per se*

* *Prom.* “Fate, who accomplishes her own purposes, has not ordained this.”

differentiated from all other thought-elements, is yet never found alone and incomposite. Still, if it be a fact that not only external representations but internal modifications are envisaged in an intelligential capacity, and the idea of the *Ego* is therein elicited, we are necessitated to infer the existence of a faculty of Self-consciousness, by which mind may be beheld as an object, and by which Philosophy is rendered possible.

Man is able to attain knowledge in no other way than through the faculties bestowed upon him for that purpose; so far, therefore, as he exercises these faculties in accordance with the rules of their action, and in directions open to human investigation, will success attend his efforts. Philosophy depends for its existence upon the development of consciousness—the production of a healthy condition of the optic organ of the intellect—the acumen and invigoration of “the mind’s eye.” “In the crowded city and howling wilderness; in the cultivated province and solitary isle; on the flowery lawn and the cragged mountain; near the murmur of the rivulet and amid the uproar of the ocean; in the radiance of summer and the gloom of winter; while the heavens thunder, as well as when the breezes whisper,” the self-consciousness of man makes itself felt. Without this all nature would be a lifeless, profitless fact; for the objects which experience presents to us cannot truly be said to exist, so far as we are concerned, till the Intellect, by its volitional processes, asserts the superiority of its active energies to the passive receptivity of its nature, and by the operations of its arranging and combining powers, endeavours to reduce the presentations of experience, i. e., phenomenal knowledge, to distinguishable elements and classes, and thus, by the steadying of objectivities before the scrutinizing eye of the intelligence, aims at the acquisition of a more perfect and determinate knowledge of their properties or attributes, as well as of the capacities of its own thought-powers. The means by which Philosophy is realizable, therefore, appears to be the developments of consciousness in such a manner as shall secure the *methodicalization* of experience, the *differentiation* of the *Ego* and the *Non-ego*—the *analyzation* of the powers of the thought-agency—and the *acquisition* of clear, distinct, and accurate notions of the presentations which experience lays before the speculative intellect for examination, as well as of the various self-developed notions which originate from the mind’s perception of the operations which it performs upon these presentations. That such a power is attainable by the intellect we cannot doubt, if we reflect that the very existence of the philosophic aspiration imperatively demands such an introspective procedure on the part of the cognition, and that we have no reason for believing that any aspiration of the human soul is destitute of the means of its realization.

Having thus, in a few elucidatory and suggestive sentences, presented the reader with a slight abstract of an argument for the possibility of Philosophy, we shall proceed to mention a few of those circumstances in “the life of humanity,” which seem to us to have called forth the philosophic instinct, and to have led to the gradual though spontaneous *exurgence* of “the problems of the Reason.”

When the impressions derivable from the phenomenal world are intromitted into the intelligential sensorium—a boundless magnitude of wonders, where the magic of glorious landscapes present themselves to man’s view, and the heavenly star-worlds come out as “preachers of beauty, and light the universe with their admonishing smile”—there arises within the human soul, “as if the touch of an angel’s hand were to awaken a sleeper in

his cell," a dim, mysterious, and undefined conception, that "not for nothing" does the universe, with all its various inhabitants, exist. Every being and element of nature appears to fulfil its own determinate purpose, and each specific item seems pre-organized to accomplish its own part in the drama of reality. This idea is necessarily conditioned in the mind by the operation of the laws of its energies, called into activity by the phenomenal impressions which it receives. "Were there no sensation, there is no reason to believe there would be knowledge; but when once there is sensation, the mind, from its internal constitution, posits things altogether and essentially distinct from sensation, or from any possible transformation of sensation." It is, therefore, because man is created capable, upon the reception of impressions, of positing, *in thought*, the results of the forms of his intellectual faculties, that the idea of destiny originates in the mind. Were man destitute of reasoning power, of the undeveloped germs of such thoughts, what circumstance could so affect the mind as to elicit the cogent queries, *Why? What? How? Wherefore?* In the earlier stages of life, too, when man's nature, with all its curious diversity of feelings, thoughts, passions, and desires, begins, like an early spring blossom, to unfold itself, the world seems expressly calculated to afford scope not only for the highest development of the intellect, but also for the unlimited gratification of the sensuous emotions, and hopes beat high, and bright illusions gather, as roseate dawn-clouds smile in a mirage, in the panting bosom; but it is not long until he learns

"A truth which needs
No school of long experience, that the world
Is full of guilt and misery."

This, however, only tends to deepen the intensity of the sense of mystery which man feels. These faculties, these desires, emanate from our constitution, and seemingly point to happiness as their result. Wherefore, then, does disappointment clog enjoyment? We suffer, we revolt, we doubt, we feel aggrieved as well as surprised, at the apparent anomaly and cry out, like Festus—

"I run the gauntlet of a file of doubts,
I ask a hundred questions what they mean,
And every one points gravely to the ground
With one hand, and to heaven with the other."

What, then, can be the destiny of a being so curiously framed—a creature whose aspirations are heavenward, and whose passions tend to earth—and who feels an almost insurmountable difficulty in adding,

"The purity of heaven to earthly joys?"

Alas! that the conjunction should be, practically, so rare! And is it not an all-interesting query, what shall enable us to avoid

"The dull satiety which all destroys,
And root from out the soul the deadly weed which cloy?"

In the crowded city—in the mart and congress of the people—in the busy haunts of manufacture, man seems as if he were earth's emperor; but when he comes into the presence of nature, and becomes aware of the magnificent spectacle of creation—when he beholds, enclosed in the horizon of his own view, mansions, villages, towns, mountains

forests, lawns, the vast extent of the "most starry canopy" which night unfolds to view, and feels himself a mere point in creation, and even the earth on which he dwells a scarcely discernible speck in the vast amplitudes of space, then come forth, with greater and greater force, the soul-questions, What is man?—and his destiny, whither doth it point? While the Speculative Reason is labouring to acquire a solution of this mystery, we can conceive no "temple more divinely desolate" than is the doubt-tossed soul; but when the God-answer dawns on his intellect, with what intense rapture is his *eureka*—I have found it—uttered!

"Man is the cruellest enemy of man. Lawless hordes of savages still wander through vast prairie-lands, where man meets his fellow-man in enmity, and perhaps glories in devouring him as food. * * * Defying toil, danger, and privation, armies penetrate forests, cross wide plains, till they meet each other, and the sight of their brethren is the signal for mutual slaughter. Armed with the most potent and splendid of human inventions, hostile fleets traverse the ocean; through waves and storm man rushes to meet man in order to destroy each the other with his own hand, amid the raging of the elements, upon the lonely, inhospitable sea. In the interior of states, where men *seem* united in equality under the dominion of law and justice, it is for the most part only force and fraud that rule under these venerable though desecrated names."* Thus it is now; but shall it be thus for ever? Wherefore do men exist upon the earth?

This idea of destiny, thus forced in upon the consciousness of man, how fertile in topics of thought—how pregnant with philosophic thought! Mind, Matter, Creation, God, Time, Space, Magnitude, Power, Fate, Necessity, Contingency, Condition, Change, Cause, Effect, Intelligence, Externality, Form, Colour, Barbarism, Civilization, Morals, Law, &c., with all the problems they involve, are but so many educts of consciousness, stimulated into activity by the idea of destiny—an idea coeval in its development with man's earliest thoughts—co-extensive with the whole range of humanity, and perceptible in a higher or lower degree of intensity, wheresoever pleasure or pain have written their signatures on the human soul.

Our purpose in the projected series of articles on "European Philosophy" will be to present our readers with a brief panoramic view of the efforts of the intellect to solve its own problems; to lay before him a comprehensive outline of the labours, the speculations, the errors, the discoveries, and systematic expositions of the thought-science of the great monarchs of mind who, for a succession of ages, have been engaged in speculations regarding the various conceptions involved in the idea of the "Destiny of Man"—men who, in general, have displayed the rarest union of speculative thought, pure taste, extensive erudition, unrivalled felicity of illustration, earnest zeal, purity of character, and eloquence of style, and by so doing not only convince the reader that "philosophic ideas fulfil an indispensable office in the evolution of humanity"†—but also that there is within it a "vigorous principle of vitality." * * "It never allows mankind to wander far, nor long, without pressing its claims and obtruding its counsels and admonitions upon them. It must, therefore, have a permanent hold of our sympathies, some fixed root in our nature,

* Fichte's "Die Bestimmung des Menschen"—The Destiny of Man.

† "Les idées philosophiques remplissent un office indispensable dans l'évolution de l'humanité," E. LETTRES de la Philosophie Positive, page 3.

or it would have been obliterated long ago from the book of knowledge." * In this survey the student must not be surprised at the multiplicity of systems which he will find us chronologizing, since "the tablet of the mind is not like a chess-board, where the unfinished game may be taken up at the point where the last player left it; for the movements of thought are complicated and subtle, and our train of ideas seldom remain fixed or visible to consciousness for any length of time. The lamp of our internal knowledge is for ever passing onwards, and we can only now and then arrest its course and benefit a little from its light. Every man has to commence a new plan for himself, and is compelled to leave it, in turn, as a broken thread, to whoever comes after him." †

† *Ibid.* xx.

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Westminster Athenæum.—On Monday evening, April 5th, the members and friends of this institution assembled for the first time at the Lecture Room, Vincent-square, Westminster, for the purpose of hearing an introductory address by the secretary.

The society was established in October, 1849; from which period to the end of March, in the present year, its efforts have been somewhat restricted, owing to the limited accommodation it was in a position to afford to those desirous of attending its weekly lectures. It has now emerged into a locality more suitable, convenient, and influential in every respect. The sphere of its operations is in consequence much extended, and under such favourable auspices its future utility cannot fail to be advanced.

In opening the course of lectures for the present quarter by an address to the friends and supporters of the institution, Mr. E. Round commenced by enforcing on the attention of all present the duties and obligations devolving upon them in connexion with the work of mental and moral culture. Passing on to notice the advantages all who took an active part in such pursuits would, he briefly adverted to the effects they ultimately produced on society at large. For every encouragement he enumerated many of the eminent men of past and present times who were raised to posts of honour and distinction from the incessant diligence and persevering application. The rise and progress of literary institutions throughout the length and breadth of the country was a circumstance calculated to afford the members of this country intense gratification, and must necessarily tend to inspire them with the warmest hopes and the brightest anticipations for the future. Intelligence was the order of the day—the practical and ruling spirit of the age; and in proportion to its universal extension, they must expect error and superstition to be eradicated. The prosperity of institutions of this character depended mainly on the energy and activity of their members. Recognising this important fact, and bearing in mind the significance of the task assigned them, the lecturer concluded by exhorting them to spare neither toil nor

exertion to elevate the society, whose interests they were pledged to advance, and success would ultimately furnish their reward.

Edinburgh Temperance Mutual Improvement Association.—On the evening of Friday, the 26th March, this association held its third annual soirée, when a large number of the members and their friends were present; James Watson, president and founder of the association in the chair. After the usual edible delicacies had been discussed, the chairman delivered an excellent address, in which he spoke of the necessity of cultivating the mind, and of applying all the energies, and—if possible—undivided attention of the mind to the pursuit of knowledge. He then adverted to the excellent opportunities which were afforded by mutual improvement societies to young men for improving their minds; and believed them to be specially fitted for promoting the moral, intellectual, and, consequently, social, elevation of the working classes. The secretary read the annual report, which gave an exceedingly encouraging account of the proceedings of the past year; it concluded with the following paragraph:—"Your committee having thus given you a brief statement of the society's proceedings during the past year, cannot but express their gratitude for the pleasure experienced, and the benefit derived, by the members, both in a religious, moral, and intellectual point of view. They have also much pleasure in being able to state, that, at no period since its commencement has the society been in a more prosperous condition. In view of the foregoing considerations, they would earnestly urge upon all young men the necessity of joining similar associations, where they would not only improve their own minds, but have an opportunity of promoting the moral and social well-being of the human family." Addresses on the following subjects were delivered by several members during the evening: "The Importance of Knowledge," "Perseverance," and "Sociality." With these were interspersed a number of recitations, songs, glees, &c., thus combining "pleasure with profit," and the whole tended to produce an elevating and cheering effect on all present. "JAMES."

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

98. A. A. is desirous of commencing the study of the Italian language, but cannot indulge in the luxury of a living teacher; he would therefore be greatly obliged to any of your correspondents who, through the medium of your excellent publication, would be kind enough to give him information as to what book or books are best adapted for the private study of that language, and the method of procedure.

99. As I have perused C. W., Junior's article upon Homœopathy, and presume he is well acquainted with persons treated under this system, may I venture to ask him, Whether my friends who have adopted it are exceptions to the rule, in having remarkably pale and sickly faces? Whether they are, or are not, can C. W., Jun., inform me how this is to be accounted for?

H. D. C.

100. As I wish to become a good elocutionist, I should feel grateful if you would inform me of the best method to develop and train the voice, so as to give it power and flexibility. My voice is not deficient in strength, but requires culture. What period of life is most suitable for commencing the study of this art? I doubt whether my age (which is twenty years) is not rather late to begin.—DAMON.

ANSWERS TO QUESTIONS.

85. *Works for Seamen*.—"A Sailor" is informed, that there is a work entitled "Plane and Spherical Trigonometry," by H. W. Jeans, published in two parts, price 5s. each, with which he would doubtless be pleased. Weale has also published several useful hand-books in his shilling series, such as "The Theory and Practice of Nautical Astronomy and Navigation," "Sailors' Sea Books," &c.—A. C.

89. *The Port Royalists* were an order of Jansenists. They derived their *nom de plume* from their residence, *Port Royal des Champs*. The object of their association was to procure quiet retirement and opportunity for study. The chief Port Royalists were Arnauld, Pascal, Nicole, Sacy, Lancelot. The principal works which they issued, either singly or conjointly, are—"Grammaire Générale Raisonnée;" "Elémens de Géométrie;" "L'Art de Penser;" "Traité des Vraies et des Fausses Idées;" "Théologie Morale des Jésuites;" "Pratique Morale des Jésuites;" "Pensées sur la Religion;" "Lettres à un Provincial." All these works are excellent. The Grammar, Logic, and Geometry still hold places as text-books in their departments, and are really wonderful productions, considering the age in which their authors flourished.

We forbear from answering more minutely, as we know that they are to engage the attention of the author of "The Art of Reasoning" in his articles on "European Philosophy."—S. N.

The Port Royalists, a society of Cistercian nuns, took their name from the place where their monastery was situated, viz., Port Royal des

Champs, a spot between Versailles and Chevreuse. The monastery was founded in the sixteenth century by Matthieu de Marli, and in connexion with it was the convent of the same name at Paris.

These women devoted themselves to the task of teaching the young, succouring the needy, and visiting and comforting the sick; and after a time were aided in this noble occupation by a few men, who established themselves near their monastery and assisted them in their holy work.

The history of these nuns forms one of the most melancholy, but beautiful, christian incidents in the annals of the church; the persecutions they endured during the stormy and intolerant days of Henri IV. and Louis XIII., for acts of which they were guiltless, and for cherishing doctrines the existence and purport of which they were totally ignorant; the noble actions they performed, the good they did, and the purity and christian grace which they preserved throughout their bitter trials, is well worthy the attention of all those who can properly admire and appreciate unswerving fidelity to truth and virtue, whether it be found among Catholics or Protestants.

A deeply touching and interesting account of them is given by Sir J. Stephen, in his "Essays on Ecclesiastical Biography."—K. W.

92. *Alliterative Verses*.—I have not been able to obtain the name of the author of the lines quoted by your correspondent, "Drumwhannan," in the April number. But the subjoined may be of some use to him in obtaining the required information. I met with it in the June number of "Wheeler's Hampshire and West of England Magazine" for 1828, where it states, that the lines having been incorrectly printed in a London publication, they had been favoured with an authentic copy by the author. The whole is as follows:—

ALLITERATION, OR THE SIEGE OF BELGRADE. A Rondeau.

"An Austrian army, awfully array'd,
Boldly by battery besiege Belgrade;
Cossack commanders, cannonading come,
Deal destruction's dire destructive doom;
Ev'ry effort engineers essay,
For fame, for freedom fight, fierce, furious fray.
Gen'ral's 'gainst gen'ral's grapple; gracious God,
How honours heaven heroic hardihood!
Infuriate, indiscriminate is ill,
Just Jesus, instant innocence instil!
Kindred kill kinsmen, kindred kindred kill.
Labour low levels largest, loftiest lines;
Men march 'midst mounds, moats, mountain-
murd'rous mines.
Now noisy, noxious numbers notice nought
Of outward obstacles o'ercoming ought;
Poor patriots perish, persecution's pest!
Quite quiet quakers, "quarter, quarter quest."
Reason returns, religion, right redounds,
Sawarow, stop such sanguinary sounds.
Truce to thee, Turkey, terror to thy train;
Unwise, unjust, unmerciful Ukraine;
Vanish, vile vengeance; vanish, vict'ry vain.
Why wish we warfare, wherefore welcome war,
Xerxes, Xantippus, Xavier, Xenophon?"

Yield ye, young Yaghier yeomen, yield your yell.
Zimmerman's, Zoroaster's, Zeno's zeal,
Again attract, arts against arms appeal.
All, all ambitious aims, avaunt, away!
Et cetera, et cetera, et cetera."—G. P.

23. *Ministerial Works*.—There are several serials devoted to the publication of sermons; among them we may mention "The Pulpit," "The Penny Pulpit," and "The Evangelical Pulpit;" all published in a cheap form. We know of no commentary exactly answering to "Drumwhanman's" description; the Tract Society has published one compiled principally from Henry and Scott; "Barnes's Notes" also deserve honourable mention. Styles's "Pulpit Studies; Aids to Preaching," &c., 4s., is worthy of perusal. There are numerous volumes of skeleton sermons, of which any intelligent bookseller will inform him. Dr. Cumming's "Scripture Readings," and Dr. Kitto's "Daily Bible Illustrations," are suggestive.—L. G. G.

25. *Transparent Painting on Glass*.—The art of transparent painting on glass is dependent for its success more on the taste and dexterity of the artist than on any peculiarity of the materials. I will inform your correspondent how I have successfully painted magic lantern sliders; one peculiarity of which I have never seen published. Having procured a piece of clear glass of a shape and size according to taste or circumstances, draw your design upon paper in outline, and stick it on the back of the glass; then grind some "drop black," with oil and turpentine, to the consistency of milk, or rather thicker; then with a soft steel pen draw the outline, which, of course, will be seen through the glass; you will by this

means be able to produce a much finer stroke than by a camel's hair pencil; let your colour be as thick as it will conveniently work, as the thinner you make it the less black will it be. Having drawn your subject in outline very finely, take some of the colours used by artists (they are ground in oil and sold in tubes), which must all be transparent; for blue, "Prussian blue," or "ultramarine;" for red, "carmine," or most of the "lakes;" for yellow, "gamboge;" for green, "verdigris;" for brown, "brown pink;" there are also other colours which are transparent, which our correspondent may ascertain by trial: put a small portion of each on a palette, and with fine camel or sable hair pencils shade and colour in your picture according to taste, judgment, and the rules of drawing and colouring; but thin your colours with Canada balsam; or, if that is not procurable, good mastic varnish will answer very well. Now, herein lies the whole mystery, if there be any—it is the balsam or varnish which gives it that beautiful transparent appearance. In colouring your painting, lay it on a piece of white paper, as the effect which it has on that will be nearly the same as it will have on the screen. This method of painting will answer for any kind of picture; but for simple figures they may be outlined in the manner described, and then coloured with water colours, which is much easier; but they must be afterwards varnished with the above varnish. There is a method of transferring engravings to glass, but the process is too lengthy to detail here. If our friend J. G. wishes to obtain further information upon this or anything connected with the magic lantern, by forwarding his address to the Editor, I will give him any he may require.—REMBRANDT.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XV.

1. What are the two diverse powers which the Intellection possesses?
2. What is the "use of the Syllogism" in the discovery of new truths?
3. What is the "use of the Syllogism" in the development of truths already known or newly suggested?
4. Give examples of both of these uses.

GRAMMAR CLASS.

Exercises in Grammar.—No. IV.

1. Prepare a form like the subjoined, and arrange the following nouns according to their genders.

London, George, author, daughter, mistress, painter, poet, earl, father, house, ink, book, bull, cow, gender, ram, horse, goose, mother, cock, shoe, desk, cupboard.

2. What is gender?
3. How many and what methods are adopted for its expression?
4. Give the feminine of George, Sultan, Czar, and Landgrave.

5. Mention cases in which the masculine and feminine genders are applied to neuter objects, and *vice versa*.

6. Give examples of nouns which are both masculine and feminine.

SOLUTIONS.—III.

Arithmetic and Algebra.

Question 9. Let x = area of pit in inches. Then 62726400 in. = x = ground that is to be covered with clay. But the ground to be covered \times by depth of clay = cub. in. of clay required to cover the field; but this must = cub. in. of clay dug out of pit.

$$\therefore 4(62726400 - x) = x \times 144 \therefore 148x = 250905600$$

$\therefore x = 1000000$ in. area of pit = 17. 3 ps. 7 yd
3 ft. 3 in. 10 in. F. D. B.

Question 10. Value of 1 oz. = 23 17s. 10½d.
23-08375.

No. of oz. in 1 cub. ft. = 17-089 × 1000 = 17089.

Val. of 1 cub. ft. = 23-08375 × 17089 = £39342-9187

\therefore No. of cub. ft. = $\frac{760000000}{39342-9187} = 19071-7003$ Ans.

J. B. L.

Question 11. $\sqrt{9781-51} = 98-9$ Ans.

Reasons of the Process for Extracting a Square Root.—The least number consisting of two figures is 10, whose second power is 100 which is the least number consisting of three figures. . . the second power of any number consisting of two figures must contain less than the figures. As before said, 100 is the least number that can be expressed by three places of figures its second power is 10000 = 100 × 100, the less number that can be expressed by five places of figures, . . . the second power of a number consisting of two figures cannot contain more than three or four figures; or which is the same thing the second power of any number of places of figures can never be more than twice that number of figures, and may be one less.

The above accounts for the usual mode pointing off the figures in periods of two and for it is clear that for one or two figures in a second power we get units in the root, and thence for three or four figures in the second power we get tens in the root, &c., so that the number periods in the second power is equal to the number of figures in the root. The method of doubling the quotient figures, &c., depends on the Four Prop. of Second Book of Euclid, by which it is proved that if a number be divided into two parts the second power of the sum is equal to the sum of the second power of the parts, together with twice their product. To illustrate this, let us take the number 40, which is made up of 40 ÷ 4 = 10; $40^2 = 40^2 + 8^2 + (40 \times 8 \times 2)$. W. E.

Question 12 7, 11, 19, 104, 180. Strike out 1 for whatever contains 104 must contain this number (since $26 \times 4 = 104$). Again, divide either 1 or 180 by 4, as $26 \times 4 = 104$, and $45 \times 4 = 180$; it is evident that $26 \times 4 \times 45$ either = 104×45 , 26×180 . Consequently, $26 \times 4 \times 45$ is divisible both by 104 and 180. Hence, for the least multiple we have $7 \times 11 \times 19 \times 26 \times 4 \times 45 = 68468$ Ans.

Geometry.

Question 3. A gallon of water = 277-274 cubic inches = contents of the sphere of water, or of 1 inside of glass sphere, and $277-274 + 1 = 278-274$ contents of the whole sphere, viz., water & glass.

Now the inside diameter of glass sphere $\left(\frac{277-274}{\frac{4}{3} \times 3.1416}\right)^{\frac{1}{3}} = 8.000388$ inches, and the outside diameter of ditto = $\left(\frac{278-274}{\frac{4}{3} \times 3.1416}\right)^{\frac{1}{3}} = 8.100111$ in and the thickness of the glass = $\frac{1}{2}$ the difference between the inside and outside diameters of glass sphere = $\frac{8.100111 - 8.000388}{2} = .004861$ inch Ans.

C. M. B.

Question 4. This question admits of an analytical investigation. Let a = the length of a

line, and assuming x , $4y$, and $3y$ to be the sides of the required squares, then per question $x^2 = 16y^2 + 6y^2 = 25y^2 \therefore x = 5y$. But $4y + 3y = a \therefore y = \frac{a}{7}$ and $4y = \frac{4a}{7}$ and $3y = \frac{3a}{7}$.

P.

Mechanics.

Question 5. The weight of a cubic foot of water is 62-5 lb.; multiply this by 350, the number of cubic feet, and by 10, the distance from which it falls; then again by 4, the modulus of the wheel, and the result will be the number of units performed by the engine per minute, this divided by 33000 will give the effective horse power of the engine.

$$\frac{62.5 \times 350 \times 10 \times 4}{33000} = 2.677 \text{ horse power. Ans.}$$

S. A. S.

Question 6. From the property of the lever, that the power and weight are inversely as their distances from the fulcrum, we have

$$P = \frac{2 \times 112 \times 6}{4 \times 12} = 28 \text{ lb.}$$

J. E. L.

QUESTIONS FOR SOLUTION.—V.

Arithmetic and Algebra.

17. Three travellers, whose rounds occupy 14, 20, and 48 days respectively, met on Christmas day, 1861, at a certain inn. At what date will they meet again at the same inn, supposing they continue to go the same rounds in the same time, and use the same horses?

18. Required the weight and value of a lump of silver of the same size as that of gold in Question 10. The specific gravity of silver being 10-334, and its value 5s. 6d. per ounce.

19. Three persons, while conversing about their money, discovered that if A's were added to half the sum of B's and C's, or B's to one-third of A's and C's; or C's to one-fourth of A's and B's, it would be £100. The sum of money which each possessed is required.

20. Given $x - y = 12$, and $x^2 - y^2 = 336$, to find x and y .

Geometry.

10. (a) Required the diameter of a sphere of gold equal in size to the lump in Question 10 (Arith.) (b) Also the side of a cube of silver of equal value. The specific gravity and value of silver, as above.

Mechanics.

9. In what time will an engine of six horse power fill a tank 20 feet long, 12 feet broad, and 6 feet deep, from a well 24 feet in the section, if the level of the water in the well be 26 feet below the bottom of the tank when the engine begins to work, and no water runs in during the process?

Errors.—On page 116, Solution 11., Arith., line 4, for 850×670 , read $850 + 670$, line 10, for 700 775, read 700 775, line 11, for 807 03, read 807 503, line 12, for $x = 22 97$, or 1797 03, read $x = 22 97$, or 1797 000, and line 13, for 22 97, read 22 967. In Solution 11., at the top, for 2 s., read 3 s. In Geometry, Solution 11.,

$$\text{for } x = \sqrt{\frac{1848 \times 400}{7000}} \text{ read } x = \sqrt{\frac{1048 \times 400}{7000}}$$

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

XL VI—THE HISTORY AND STRUCTURE OF THE ENGLISH LANGUAGE.

THE dim magnificence of myth and legend generally overhangs and enshrouds the origin of nations. "Earth's mighty yesterday"—how many mysteries and uncertainties are yet unsolved regarding it!

"Ghost-like amidst the unfamiliar Past,
Dim shadows flit along the stream of Time;
Vainly our learning trifles with the vast
Unknown of ages!"

How little can we learn, with accuracy, of the annals of our race, even at periods long subsequent to the time when our forefathers trode

"The earliest furrows on the mountain side,
Soft with the deluge!"

The childhood of nations is usually permitted to glide by with few of its events enregistered in memory. The youth of humanity is passed more in action than in thought—more in an earnest struggle for "the bread which perisheth," than in intellectual endeavour. Hence, although circumstances, all-important in their consequences, may have occurred in the hot and lusty youth of our race, they have been allowed to remain so long unnoticed, that when our attention is directed towards them we find the chief evidences of their actuality

"Overgrown with black Oblivion's dust,"

and "*Fetustate nimia obscuras.*"* And even when the historian's pen or the poet's elegiac odes and elegies are called in requisition, we too frequently find that the tale or rhythm is all of heroes old arming for battle, or rushing headlong to the onslaught fierce and fell. This is most especially to be regretted,

"For in the morn and liquid dew of youth
Contagion's blastments are most imminent;"

and this warrior-worship not only withdrew the mind from more pure and utile exertions, but also rendered men careless of recording those less remarkable, though far more important, occurrences which lead to the advancement of humanity. The sources of information regarding the real state of men in the world's youth are, therefore, scant and sparse, and require to be read with all the keen minuteness of a critic. They consist, for the most part, of monumental inscriptions, art-relics, architectural remains, works of industrial skill, coins, songs, proverbs, sagas, and traditions. When we unlock the memory-treasures of "the world's gray fathers," it is true, we find some few casual and random notices of "things as they were," which, with a few other fragmentary admiralicular evidences, enable us to construct an hypothetical history which is, in its main

* "From their excessive antiquity obscure."—*Livy*.

points, probably correct, but which must of course vary in its exactness in proportion as the facts which form the groundwork are intelligently presented to the investigation of the Reason. To collate such facts as seem to us to bear upon "the History and Structure of the English Language," is the chief purpose of the present paper; let us address ourselves as briefly as possible to the task, and let us carefully notice whither the evidence indubitably points.

One remark, however, we must premise regarding the Law of Evidence, viz., Evidence is of two kinds, *External* and *Internal*. The *former* is, in general, the more obvious and distinct—it breaks upon the view more readily, is more easily apprehensible, is more superficial and more level to the general understanding; the *latter* is more obscure and intricate, farther removed from ordinary perception, and less readily attainable: the *former* may be discerned, as it were, by the naked eye; the *latter* can only be discovered by instruments of observation, skilfully adapted to the accomplishment of the given end. Neither of these species of evidence *alone*, however, can give absolute satisfaction to the mind; it is only when there is a *concursus*, i.e., a gradual tendency and convergence to the same point, that the Intellect acknowledges that our reasonings are valid and our hypotheses consistent. Our readers will please bear this remark in remembrance, in order that they may observe whether the facts and reasonings in this article fulfil the conditions above noticed.

It would lead us too far, and, indeed, would bring us to the discussion of topics very alien to the present subject, were we to attempt the unravelment of the intricacies of early European Ethnography, and endeavour to decide dogmatically regarding the circumstances, times, places, &c., of the various migrations of the different tribes who peopled what is now earth's most important continent. A slight and cursory sketch is all that we dare venture. The natural multiplication and increase of the human race—the separation of men into families and tribes—the gradual growth of nations—the selfish, predatory, and warlike habits of the populations into which the race thus becomes detached—the little care bestowed upon the culture of lands continually subject to inroad, pillage, and devastation—the exurgence of a redundant population—the occurrence of casual famine—nomadism—the hope of plunder and conquest—the thirst for stirring adventure—the irksomeness of restraint and subordination—the love of novelty—contests between oppressors and oppressed, &c., may all be mentioned as predisposing causes to the dispersion of mankind, while change of situation, climate, mode of life, state of society—the view of new objects—the knowledge of new products—the origination of new pursuits—the blending of different families and tribes by migration, or their subordination by war, &c., and the consequent introduction of new thoughts and novel forms of expression, may be mentioned as among the causes instrumental in producing changes of languages. From some of the above-mentioned causes, either singly or combinedly, that vast series of migrations, which from century to century continued to be made from the interior of Asia into the continent of Europe, most probably took its rise. As horde after horde departed willingly, or were driven off involuntarily, from that great hive of humanity, each necessarily attempted to dislodge the prior occupants in order to secure a lococation for itself. There was a further temptation to this, also, in the prospect of appropriating the dwellings, cultivated soil, &c. of the pioneer hordes to themselves. Keen, keen indeed, must have been these contests

between invaders and invaded. In general, however, the assailants succeeded in effecting a settlement, either by treaty or by conquest, until at last the whole surface of the continent of Europe resounded with the hum of busy populations. The most remarkable of these immigrational expeditions we shall now cursorily indicate:—

I. About the year B.C. 2000, the Celts* passed from Upper Asia into Europe, and peopled the territories lying south and west of the Danube.†

II. About B.C. 1800, the Pelasgi, under Inachus, proceeded, most probably, from a country bordering upon the Euphrates to the islands and coasts which lay opposite to Asia Minor; but subsequently crossed over to Italy, Crete, and the adjacent islands.

III. The Hellenes, consisting of the Achæians, Æolians, Dorians, and Ionians, who drove the Pelasgi before them and occupied their settlements upon the borders of the Archipelago.

IV. About B.C. 1582, Cecrops led a colony from Sais, in Egypt, and founded Athens.

V. Cadmus, about B.C. 1519, came from Phœnicia and colonized Thebes, in Bœotia.

VI. An Egyptian colony arrived in Argos, under the leadership of Danaus, about B.C. 1500.

VII. An influx of population—supposed to have originally emigrated from the regions of Tartary—known in Greek literature under the general designation of Scythians, is ordinarily referred to the seventh or eighth century B.C., although it is more probable that several distinct colonies successively appeared, and contested with their forerunners the possession of the soil. Of these there would seem to have been various tribes; among others may be mentioned the Getæ, the Massagetæ, the Sauromatæ, the Unni, &c.; the ancestors respectively of the Ostrogoths in Italy, the Visigoths in Spain and Portugal, the Mœsia-Goths in Germany, Norway, and Sweden, the Sarmatians or Slavonians in Russia, Poland, Bohemia, &c., the Huns in Hungary, &c.‡

VIII. From the eastern side of the Sea of Asoph, under the command of Odin or Woden, about B.C. 24, another Gothic people proceeded across the Straits of Kaffa, through the north-west of Europe, and onwards to the countries bordering on the Baltic, part remaining there, while another portion, crossing the Cattegat, entered the Scandinavian peninsula.

Of course it is easy to see, that, as each invading colony advanced, the former inhabitants must remove, and hence that the earliest colonists would be pushed most nearly to the extremities of the continent, and so we find history recording. But it is also evident that these isolated tribes would soon learn that security from gradual extinction could only be attained by mutual aid, while this very isolation would be the surest guarantee of the success of the ambitious; thus there would arise two causes for the interfusion of tribes—1st. Treaty; 2nd. Conquest. These successive interfusions would necessitate changes and modifications of Language, and hence would originate those differences of speech which were the primal fountains of our English tongue. The extensive power wielded by Greece and Rome successively, and the magnificent system of colonization which they adopted,

* From *αἰλῶες*, woodsmen, connected with Welsh *cell*, a covert or shelter, and Latin *celo*, I hide.

† Herodotus, book iv. cap. 49.

‡ For information, so far as to be found in the ancient writers on the origin of the Scythians, see Herodotus, book iv.:—1st, for the Scythians' own tale of their origin, cap. v.—viii.; 2nd, for the opinion of the Greeks near the Black Sea, cap. viii.—x.; 3rd, for the commonly received opinion in the time of Herodotus, cap. xi.—xiii.; 4th, for the opinion of the poet Aristæus of Proconnesus;—also on the general question, Justinus, book ii., and Pliny.

would, in part, tend to lessen these diversities; so that for all practical purposes we may regard the languages of Europe at, or about, the invasion of Britain (B.C. 55), as divisible into three great classes, which, with their principal subsequent sub-divisions, may be expressed tabularly thus:—

1, CELTIC.	2, GOTHIC.	3, CLASSICAL.
Basque, Gaelic, Welsh, Irish, Cornish, American, &c.	Russian, Saxon, Dutch, German, Danish, Swedish, Belgic, &c.	Greek, Latin, Italian, French, Spanish, Portuguese, &c.

Having brought into one view the state of the European languages at this era, we shall forsake the discursive dissertation in which we have been indulging, and present our readers with a condensed synopsis of the chief facts relative to the History of the English Language.

1st. The earliest inhabitants of this country were Celts.

The proofs of this are—(a) the names of the chief natural permanent objects in our country retain Celtic names, as, *Aron*, a river or stream; *Bala*, the issue of a river, *e.g.*, Bala in Wales, Balloch in Dunbartonshire, Scotland; *Ken* or *Cean*, a head or end, *e.g.*, Kent; *Ta*, what expands, *e.g.*, Tay, Tamar, Thames, &c.; (b) a diligent comparison of the Celtic tongues spoken in Scotland, Ireland, Wales, the Isle of Man, Brittany, in France, and the (now extinct) language of Cornwall—little or no material difference is found among them; (c) the testimony of Cæsar (Commentaries, books iv. and v.), Tacitus (Agricola), &c.

2nd. On the 26th August, 55 B.C., this country was invaded by Julius Cæsar, and remained for upwards of 400 years a province of Rome.

This is proved—(a) by Cæsar's own account of the conquest; (b) by numerous allusions to that conquest:—i., in the letters of Cicero; ii., in the contemporary poets; iii., in the writings of Strabo, Diodorus, Siculus, &c.; iv., in the Agricola of Tacitus; v., in the works of the christian fathers; vi., on inscriptions and coins of that time; vii., in the panegyrics of Eumenius and Libanius, as well as in the writings of one or two of the minor historians of Rome;* (c) by the remnants of their language yet to be found in the names of places, &c., *e.g.*, Lindi Colonia—Lincoln; all those names of places ending in *chester*, *caster*, or *cester*, as Dorchester, Lancaster, Leicester; as well as all those ending in *wich*, as Greenwich, &c.; (d) by the accounts of the decline of the Roman power.

This last circumstance led to the withdrawal of the troops from the extremities of the world-empire, their concentration in or near Rome, the weakening of the distant colonies and dependencies, and, consequently, to their being left a ready prey to incursion and conquest. Having learned to lean upon the arm of foreign power for support, when this aid was withdrawn they felt themselves nerveless and impotent. The Celts, who had been pent up in the mountain fastnesses, yet unsubdued, eagerly sought to widen their territorial possessions, while from the coast-lands on the opposite shore, a series of pirate-tribes threatened invasion. Not long after, the swift war-barks of the sea-kings—their magic raven ensign, woven in one night by three maiden enchantrices, floating in the wind—ploughed the seething foam and landed their fierce forces on our shores; lance, axe, spear, bow, shields, and helm-crests are seen in one mingled maze; the demoniac shouts of war are heard. Then follow in quick succession the onslaught, the battle shriek—spears crashing like crisp ice-spars on the ribs of steel-clad war-men—the thunder clangor of

* For these authorities quoted at full length, see "History of the Ancient Britons, from the Earliest Period to the Invasion of the Saxons." By Rev. J. A. Giles, D.C.L.

the horn—the groan of the dying—the maddening fury of despair—and the glory-flag of the victor invaders waves over our ocean island. The stark fight terminates; over many a brave body—left on the field to the “black raven and the croaking toad, the eagle hungering after flesh, the greedy kite and the wild wolf of the woods”—is the heart’s dirge sung by the beautiful. But soberer topics lie before us. We delight not in the hell-cry of brutishness which resounds from the battle-field. We love not the music of clanging arms, the rush of mutual slaughter, the groan of the death-victim, or the wild wail of woman’s grief-riven soul. Therefore shall we throw a veil over those hideous scenes of blood, nor look again upon the grim and ghastly spectacle presented by the gore-dewed field. To proceed.

3rd. After the decline of the Roman empire, Britain was invaded, at several periods, by certain tribes of Gothic descent, and taken possession of by them.

The particular tribes who took part in these successive invasions have never been properly discriminated, nor has the portion of the continent from which they proceeded been accurately defined. It is now most generally believed that the Holstein, Fresian, Swedish, and Norwegian tribes were among the chief—that (the present Duchy of) Holstein was divided among three Saxon tribes—that north of them, in (the present Duchy of) Schleswig, dwelt the Angles—that to the west of Schleswig, opposite the island of North Strand, the inhabitants were Friesians, and that the tribe of the Jutes had never any real existence. The Saxons, then, using the word in its most extensive sense, may be said to have inhabited all the coasts of the Elbe, the North Sea, and the Baltic. The position evidently predisposed them to a piratical mode of life. Thus we find that even when Britain was a Roman province, the depredations of these pirate tribes were so common, that the Romans organized a fleet to cruise along the Saxon shore (*Littus Saxonicum*); but these fleets were manned by parties of the same race, who were rewarded for their marine services with grants of strips of land along that coast. When, however, the Roman power declined, the fleet was withdrawn, and the North Sea was again frequently ploughed by Saxon keels, and the shores of Britain were again frequently made tributary to the necessities of these races. But, tempted by the richness of the country, pressed by an increased population, and inspired with the love of conquest, successive colonists landed upon our “nook-shotten island.” Regarding the particular periods of these influxes of conquerors, there is some slight disagreement; for our own part we believe that these went on gradually, and that only the more important and striking have been mentioned or recorded. Indeed, the most rigorous criticism fails to dispel the obscurity in which the whole is involved; but the general fact admits of no question, viz., that a continuous influx of Gothic, i.e., Germanic, tribes poured into the country, gradually gained the ascendant, and gave to the country their name, language, laws, and customs. So far, however, as modern researches have been successful in unclouding the matter, the following statements present a concise outline:—

(a) About the year 449 A.D., a band, said to be Jutes, but most probably Friesians, under the leadership of two brothers, Hengist and Horsa, landed at Ebbsfleet, in the Isle of Thanet, in Kent. In about six years after that period they had acquired the mastery of that county, and had established the kingdom of Kent. The British Celtic was thus first displaced by the Saxon in Kent. (b) About A.D. 477, a Saxon colony, commanded by Ella, debarked upon the coast of, what is now called, Sussex, and established themselves permanently in that county. (c) About the year A.D. 495, a second Saxon immigration

headed by Cerdic, entered England on the coast of Hampshire. (d) The year 530 A.D., is said to have witnessed the descent of a third Saxon colony upon that part of the country now denominated Essex. By a gradual extension of power, influence, and population, the Saxons spread themselves over, and became masters of, those portions of England now represented by the names Sussex, Hampshire, Dorset, Wilts, Gloucester, Oxford, Berks, Buckingham, parts of Somerset, Devon, and Surrey, Essex, Middlesex, and part of Hertford. The so-called Jutes were already in possession of Kent and the Isle of Whit—whence, probably, they were called Jutes. (e) While Cerdic reigned in Wessex, a settlement was effected on the coasts of Norfolk and Suffolk. These were *Angles*, and the peculiar dialect of the Gothic which they introduced has been called the *Anglic*. They afterwards extended their possessions to Cambridge, parts of Lincoln and Northampton, besides the Isle of Ely. (f) About A.D. 547, under Ida, a colony from *Anglia* landed on that part of the coast of Scotland which lies between the Forth and Tweed, spread gradually over all the south-eastern counties of Scotland, as well as over Northumberland, Westmoreland, Cumberland, Lancashire, York, Cheshire, Nottingham, and the other North Midland shires. Thus we have seen nearly the whole surface of the land invaded and conquered, reft from the original Celtic population, who were ultimately compelled to betake themselves to the rocky fastnesses of the North of Scotland and the West of England, and then began that interfusion of peoples and of speech, which resulted in the production of the Anglo-Saxon tongue.

We have already intimated that we do not believe that the traditional accounts of the above-mentioned invasions are remarkably accurate in their chronology; we are rather inclined to believe that they had, even from an early period, been in the habit of landing on our coast-land and our barren beach-tracts, and that having occupied these settlements for some time the retirement of the Romans seemed to facilitate aggression and invite conquest. Several intermediate changes took place during the succeeding years, not exactly relevant to our subject, though bearing upon it. Mention of these we must, however, omit, and direct attention to the most important event which next occurred. In A.D. 806 a politic Bretwalda governed Wessex and Sussex; becoming ambitious, he began to sigh for wider domains and more extended rule. He overcame Kent in A.D. 819, Essex in A.D. 824, and went on in his triumphant career, until in A.D. 828 he raised his throne upon the ruins of the Octarchy, and was proclaimed king of all England. This sovereign's name was Egbert. By this process of consolidation and identification the different laws, customs, languages, &c., were fused into a certain degree of sameness. This was the morning dawn of Anglo-Saxon literature, one of the earliest of modern Europe. It is divided into three periods:—i., British-Saxon, from A.D. 449 to 867; ii., Danish-Saxon, from A.D. 867 to 1066; iii., Norman-Saxon, from A.D. 1066 to 1272. It is a transition literature, but one of nobleness and worth.

4th. This fact is not introduced exactly in its chronological order because it has been, in its beneficial influence, co-extensive with all future time—we refer to the introduction of Christianity. There are considerable discrepancies among the traditional accounts of this remarkable event. Some place it so early as between A.D. 43 and 61. We know, however, that several Christians, of whom St. Albans, of Verulamium, was the first, suffered martyrdom about A.D. 286. Then we have the Pelagian heresy, originated by a British monk, named Morgan, about A.D. 424. Afterwards we have the mission of

Augustin and forty monks—sent hither by Pope Gregory I., surnamed *the Great*—who landed in the Isle of Thanet, A.D. 596. The first British church was built of wood by Paulinus in Northumbria, A.D. 627. As the services of the church were conducted in Latin, and all literary compositions were at this date written in that language, as also the chief missionaries must have come from some part of the old empire of Rome, they must necessarily have spoken that tongue. It would, therefore, appear that a considerable infusion of Latin must have been introduced into the Anglo-Saxon tongue, *e.g.*, monk, saint, psalter, purple, epistle, febrifuge, porch, &c., respectively from *monachus*, *sanctus*, *psalterium*, *purpura*, *epistola*, *febrifuga*, *porticus*, &c.

5th. As we learn from the Saxon Chronicle, “the first ships of Danish men who sought the land of the English race” appeared in A.D. 787. “From this era,” remarks Sir James Macintosh, “the Danes became the incessant foes of Britain, visiting every part of the island with fire and sword.” In A.D. 867 they had conquered the greater part of England north of the Humber; subsequently they acquired the Midland counties; they next advanced towards Norfolk, Suffolk, and Cambridge, and became masters there; lastly, they invaded Wessex, the king of which was at that time looked upon as lord paramount of the whole country. In A.D. 878 King Alfred gladly concluded a treaty with Guthrum, their chief, by which he ceded to the Danes all the land upon the east coast, from the Humber to the Thames, besides the kingdom of Northumbria. This was subsequently called *the Danelagh*. In A.D. 1013, Sweyn, king of Denmark, conquered all England, and the crown remained with his descendants till A.D. 1042. Speaking of this period, Thierry says:—“The long-accumulated sufferings of the Saxons at length produced their fruit. On the death of Hardicanute, a great insurrectionary army was formed, under the command of a leader named Howne. Godwin and his son Harold raised the standard of independence in every county against every Dane—king or claimant, chief or soldier. Beaten back rapidly to the north, driven from town after town, the Danes left the country, and landed—greatly diminished in numbers—on the shores of their old country, A.D. 1039-40.” But the strange drama of British invasion is not yet ended, for,

6th. In A.D. 1066 England was conquered by the Normans—a Danish race, who, under Rolf, or Rollo, invaded the north of France about the same time as the Danes began to occupy Britain. In A.D. 912 Charles, surnamed the Simple, ceded to them a tract of land under the name of Normandy, and over that they ruled as dukes of Normandy. There they in a great measure exchanged their ancient dialect for the Latino-Francic tongue, then spoken in France, and which formed the derivative-source of the present French. The change introduced by this conquest was very great—the king, the nobles, the lawyers, the churchmen, the monks, and the soldiery, all spoke the Normanic French, and these naturally sought to spread that language among subjects, retainers, serfs, clients, proselytes, pupils, &c. For a time, therefore, the Normanic French “mightily grew and prevailed.” A subsequent influence, which tended still more to aid the propagation of the French tongue, was the marriage of Henry II. to Eleanor of Poitou, by which the English king became master of Poitou and Guienne, as well as his patrimonial estates, Anjou, Maine, and Touraine, together with his dukedom of Normandy. To a great extent, at this period, must Britain have been amalgamated with the rest of Europe, if we consider the intimate connexion which its sovereigns had with France, and its clergy with Rome. Yet it is a singular fact that the native Anglo-Saxon did not wholly

succumb to these adverse influences, but that the language of the conquerors give place, in a great measure, to the speech of the conquered; so much so, that about the year 1270 a new form of language—an interfusion of all those afore-mentioned influences—emerged, under the denomination of the English Language. To give a brief summary we have fused together—1st. The original Celtic. 2nd. The Latin of the first period. 3rd. The Gothic, from six sources, each most probably slightly differing from the other. 4th. The Latin of the second period. 5th. Another form of Gothic, through the Danes. 6th. (a) The Latin of the third period, derived from the courts of law, and the church, from fashion and chivalry. (b) The *indirect* Latin of the Normanic French and the Provençal French of Poitou and Guienne. (c) The *indirect* Danish of the Normanic French. 7th. The Latin and Greek of literature, science, and philosophy. From all these facts—the external history of the people—put together, we learn *that the English Language is a composite one; i.e., one made up from various sources, not pure and self-sufficing, but derived from, and combined out of, many diverse tongues.*

Let us now trace, as succinctly as possible, how far the internal evidence coincides with these external facts. 1st. It is evident, we think, that as the Normanic French and the Provençal, as well as the Latin and Greek, were introduced by external agencies, and were not the outgrowths of the national mind, the words derived therefrom would be less commonly used by the main body of the people. 2nd. That the Saxon, Danish, Anglic, and Normanic, being more nearly akin, would more readily coalesce, and be more commonly employed as the embodiment of thought. 3rd. That as Saxon and its kindred tongues formed the language of the commonalty, the terms in most frequent use should be of Saxon origin. 4th. That as the mutual communication of thought could only be made by parties, the construction of whose languages differed, by the disregard of grammatical forms, there should be gradually evolved a language comparatively loose in its grammatical inflections and syntactical relations. 5th. That as the Saxons were descended from a fierce people, dwelling in gloomy woods—on barren beach-tracts—or ravaging like sea-wolves the coasts of others—the language should be expressive, curt, harsh, direct, and pointed. Such indeed it was, such among the lower classes it is. In literature, however, the sturdy, stalwart, taciturn, emphatic Saxon, has been mingled with the philosophy and poetry of the Greeks, the civilization of Rome, the chivalry of southern Europe, the melody of Italy, the stateliness of Spain, the epigrammatism of France, the suffusive beauty of oriental nations, and the religion of Palestine. It is a rude stem, bearing on its branches fruits of every clime. A few observations will make the above points apparent. (a) The Anglo-Saxon is for the most part monosyllabic, and remarkably expressive—e.g., *stab, stare, start, rap, jeer, sneer, queer, quirk, jerk, crash, smash, rash, twirl, swirl, crag, shriek, scale, scream, lift, swift, quench, growl, grunt, &c.* (b) From the Anglo-Saxon almost all words denotive of—1st. Objects of sense—e.g., *sky, sun, stars, moon, frost, cold, snow, hail, hill, stream, earth, thunder, sea, &c.*

“Rocks, caves, lakes, fens, bogs, dens, and shades of death.”—MILTON.

2nd. Relationships—e.g., *father, mother, brother, sister, son, daughter, husband, wife, child, kin, friend, &c.* 3rd. Feelings and their manifestations—e.g., *smile, love, blush, sigh, weep, tear, laugh, gladness, shame, &c.* 4th. Common actions—e.g., *run, jump, leap, slip, wink, spring, sprawl, crawl, slide, creep, talk, &c.* 5th. Home objects—e.g., *fireside*

home, hearth, roof, board, seat, &c. 6th. Business matters—e.g., *shop, shoe, shear, farm, gold, acre, angle, bargain, borrow, wed, wayer, bake, brew, cheapen, craft, worth, work, weare, truck, traffic, rich, price, prize, penny, moil, luck, master, &c.* 7th. Satirical expressions—e.g., *scraggy, scum, scoff, knave, scrank, paltry, grasping, grovel, cajole, badly, churl, curmudgeon, drab, fiend, gabby, jabber, gawky, gaunt, grubicorm, haggler, rascish, twit, trash, termagant, sleeky, shabby, mauckish, lacky, lazy, &c.* 8th. Particulars as opposed to generals—e.g., *green, blue, red, yellow, black, white, brown, gray, &c.*, are Anglo-Saxon; colour, is Latin; *hum, hiss, howl, growl, bark, buzz, rustle, rattle, roar, low, war, squeak, creak, clash, clang, &c.*, are Anglo-Saxon; sound, is Latin; *jink, clap, scamper, skip, yawn, spurn, wriggle, skim, dart, stagger, squirt, squint, &c.*, are Anglo-Saxon; move and motion, are Latin; *dog, cat, rat, cow, hen, pig, bull, horse, deer, fox, mouse, mole, weasel*, are Anglo-Saxon; animal, is Latin. (c) The English Language has the fewest inflections and the least number of syntactical rules of any of the chief modern languages of Europe. (d) The Anglo-Saxonized English is most popular with the illiterate—e.g., the works of Bunyan, De Foe, Goldsmith, Cobbett, and Swift. The middle-English, i.e., nearly equally Saxon and Latin, is most popular with the middle classes—e.g., Thomson, Cowper, Wordsworth, Scott. The Latinized-English is most popular with the higher classes, who, having had their classical tastes cultivated, and their associations led in that direction, are best able to appreciate the beauties of such writing. We think, then, that the *consensus* of evidence is complete—that the external history and internal facts of the Language agree in proving its composite nature.

We have traced, as carefully as we were able, the source-fonts of our Language; we have marked out their points of confluence, and we have partly indicated its present width, depth, and power. We saw it first issuing, as it were, from a few almost unnoticed springs, far up in the seldom-climbed hills—coursing on its unobtrusive way—troubled in its depths by turbulent onrushings from other streams—gradually combining their waters with its own, then rolling onwards in stately majesty. Looking at the Language as it now is, we must not expect that symmetry and uniformity which belongs to an edifice planned by an architect and built by successive artizans under his superintendence. No! When we consider the ten thousands of labourers to whom we owe its erection—the myriad changes originating in fancy, caprice, accident or necessity, which were made in ignorance or heedlessness of all rule—we ought rather to feel astonished at the wondrous consistency which marks a structure eliminated from such an apparently fortuitous conglomeration of heterogeneous materials, than to be disappointed in not finding a strict, steady, unswerving adherence to general principles. This observation seems to account for the many irregularities in etymological structure and syntactical arrangement, which appear to make the study of the Language difficult.

Had we had space, a brief view of early English Literature would have tended much to the substantiation of the facts above narrated, but as we have gone abroad through such a width of field, let us now proceed to answer the question hovering upon our readers' lips—What utile application can be made of the knowledge of these facts, in so far as the study of Rhetoric is concerned? Without attempting or pretending to exhaust the subject, we may, we think, deduce from what has been related, the following lessons, which ought to have a close relation to "Style," viz. :—

1st. That as Anglo-Saxon terms denote almost all natural objects, all those things

which are dear to the heart, all feelings and emotions, &c., the staple of a style intended to be plain, easily understood, and level to the capacities of the mass, should consist chiefly of Anglo-Saxon vocables.

2nd. That in a language combined from so many sources there must be many seeming synonymes, but (a) As each of these languages was introduced at a different stage of civilization, even in words of the same general signification slight variations will be found—*e.g.*, choose, from Saxon *ceosan* ; select, from Latin *se*, aside, and *lego*, to pick out; prefer, from Latin *pre*, before, and *fero*, to carry; are all connected in the one general signification of option: but *choose* means to pick out in accordance with our *will*; *select*, to pick out for a special purpose with due regard to appropriateness; *prefer*, to pick out in accordance with the *judgment*; as “A man may *select* his wife for her beauty, *choose* her for her wealth, and *prefer* her for the amiability of her disposition.” (b) Two terms for exactly the self-same idea cannot long subsist; for as the mind progresses and becomes more acute, it perceives differences unobserved before; hence the two words become differentiated to answer the exigencies of the mind—*e.g.*, anxiety and anguish, though from the same Greek root, *αἴμα* to vex, both signify distress of mind, but anxiety implies *continuity*, while anguish implies *intensity*. (c) One of the synonymes may have a greater aptitude for impressing the mass, hence it will be used with a licence and latitude of meaning, while the other, being employed only by the learned, shall retain its restrictedness—*e.g.*, act, action, deed; the two former from Latin *ago*, to do, the last from the past tense of *do*, have etymologically the self-same signification, and are so used at present among the common people; but among the learned they are thus distinguished—*act*, a single extraordinary effort; *action*, continued exertion; *deed*, continued exertion completed.

3rd. In consequence of this copiousness of expression, this possession of duplicate terms, there can be no excuse for poverty of language or baldness of expression, while at the same time the shades of connoted meaning superadded to the denotation of these terms, should form a strong argument for a careful, critical, laborious, and attentive study of words in order that precision and perspicuity may be acquired.

4th. That it is not only possible, but necessary, to adapt our style to a subject, but also to adapt our style to the class whom we intend to address.

5th. That force, expressiveness, sincerity, plainness, heartiness, homeliness and passion rousing fire may be imparted to style by the use of Anglo-Saxon. Stateliness, copiousness, grace, melody, refinement, and elegance, may be gained by the use of Latin. Smartness, primness, compliment, archness, *abandon*, diplomatic reserve, from the French; and philosophic accuracy, scientific clearness, from the Greek.

6th. That *à priori* the style which most nearly approximates to the due and proper employment of each—*i.e.*, the using of them with equal ease and thorough mastery on fit occasions and in just degree, is the best.

We are fully conscious of the inadequacy of our present effort to do justice to our subject. We feel that it is unworthy of being called even an outline, instead of a history—want of space has precluded us from tracing so clearly as we desired, the action and reaction of each Language on the other. We perceive that we have given no criterion of the parts the commixture of which each Language supplied. We believe, however, that intelligent readers will find their way through the labyrinth of causes, and clearly discriminate their effects. In our future articles “On Style,” further elucidations

these points will be found; meanwhile we must take our leave, saying with Wordsworth—

“ In our halls are hung
Armoury of the invincible knights of old.
We must be free, or die, who speak the tongue
That Shakspeare spoke, the faith and morals hold
That Milton held. In every thing we're sprung
Of earth's best blood—have titles manifold.”

To those who may be desirous of pursuing the study of this subject farther, the following collation of authorities may be useful, viz., “*Outlines of the History of the English Language*,” by G. L. Craik; “*Sketches of the History of Literature and Learning in England*,” by G. L. Craik; “*The English Language*,” by R. G. Latham; Tacitus’ “*Germania*,” by R. G. Latham; J. H. Hippisley’s “*Chapters on Early English Literature*”; Harrison’s “*Rise, Progress, and Present Structure of the English Language*”; Hallam’s “*Introduction to the Literature of Europe*”; R. H. Horne’s “*Introductory Essay*,” prefixed to “*Chaucer Modernized*,” by Wordsworth, Leigh Hunt, &c.; Shaw’s “*Outlines of English Literature*”; Warton’s “*History of English Poetry*”; Sharon Turner’s “*History of the Anglo-Saxons*,” and “*History of England during the Middle Ages*”; Lappenberg’s “*England under the Anglo-Saxon Kings*”; Palgrave’s “*History of the Anglo-Saxons*”; Kemble’s “*Saxons in England*”; Prichard’s “*Eastern Origin of the Celtic Nations*”; Rev. J. Bosworth’s “*Anglo-Saxon Dictionary*,” and “*Anglo-Saxon Grammar*”; Rev. J. G. Giles’ “*History of the Ancient Britons, from the Earliest Period to the Invasion of the Saxons*”; Hallam’s “*View of the State of Europe in the Middle Ages*”; Thackeray’s “*Ecclesiastical and Political State of Britain*”; Guest’s “*History of English Rhythms*,” and “*Saxon Language and Literature*,” in “*The Penny Cyclopædia*”; Ingram’s “*Saxon Chronicle*,” with an English Translation; Thorpe’s “*Analecta Anglo-Saxonica*”; Bede’s “*History of the English Church*”; Godwin’s “*Life of Chaucer*.” We might easily multiply authorities, but a thorough perusal of these works will furnish, in our opinion, a very complete view of the subject.

Religion.

CAN CHRISTIANS, CONSISTENTLY WITH THEIR PRINCIPLES, RENDER SUPPORT TO THE BRITISH STAGE?

AFFIRMATIVE ARTICLE.—III.

“ For lofty sense,
Creative fancy, and inspection keen,
Thro’ the deep windings of the human heart,
Is not wild Shakspeare thine and nature’s boast ? ”
THOMSON.

Is wielding the pen in support of the British stage, and its claims to the sympathy and patronage of the British public, I shall prefer adopting the view taken by C. W. Jun., in his article of the April number—viz., the essential effects of the stage; and since the honour and character of this institution is at stake in this controversy, we may in justice claim to treat it thus; otherwise we should have no fair materials wherewith to enter the combat with our opponents, for we cannot shut our eyes to the abuses and objections which exist in the modern theatres of the metropolis, containing, as they do, so much that is foreign to the true end and aim of the drama. There is, alas! too much for just criticism and con-

demnation. The productions of the modern authors are often flimsy, artificial, and altogether worthless, and even in their representation too much attention and care is given to effects in scenery, by which the spirit of the drama is greatly weakened and enervated, and the theatrical piece is deprived of that peculiar influence over the mind which it ought to possess. We cannot, therefore, attempt to advocate the efficacy of the British stage of the present day, either in justice to ourselves or to that of the modern drama, but our endeavour must be to prove that the essential effects of the English stage, in the performance of the legitimate drama, are not at variance with the high moral aims of Christianity.

Taking, then, that mighty genius, Shakspeare, the dramatic poet of the English, as the representative of the English stage, I will endeavour to prove that the representation of his productions, with the artificial

assistance of scenery, &c., are in their effects highly beneficial and efficacious in promoting the sacred aims of Christianity. And though my opponents may be inclined to quarrel with this, I contend most earnestly that he may be taken as its representative, for before he arose, the modern or English drama was formed after the models of old Greece and Rome, and since his time no writer of any great pretensions to the tragic muse has arisen to pluck the laurels from his brow.

"Aristides" has indeed brought serious charges against the stage, and has struck at its foundations, but they are at the same time bold ones, and incapable of being proved. Let us proceed, then, to investigate them, and see how far they will support his views.

In the first place, he asserts "that the stage is not a representation of society, and has no counterpart except in the mind of the author." Now, if it can be proved that the personages and characters brought before the audience in all the eloquent language of the poet, and represented by all the bewitching and consummate skill of the actor, do not fairly represent the general passions of men, but are only the exaggerated fantasies of the author's brain, then indeed must the stage be robbed of its claim to instruct in morals and philosophy, and cannot but be the medium for corrupting the hearts and minds of the people, inasmuch as it must give them false views of life, and impair their judgment in discerning good from evil, virtue from vice. But it is not so. The business of the drama is to excite sympathy, and its effect on the spectator depends on such justness of imitation as shall cause to a certain degree the same passions and affections, as if what were exhibited were real, and in order to affect this the characters and events introduced must *resemble* in truthfulness the patterns from whence they are copied. It is addressed to the imagination, through which it opens to itself a communication with the heart, where it is to excite certain passions and affections; each character being personated, and each event exhibited, the ATTENTION of the audience is greatly captivated, and the imagination so far assists in the delusion as to sympathize in the representation. To the muse of tragedy Pope has therefore assigned the noble task—

"To wake the soul by tender strokes of art,
To raise the genius, and to mend the heart;
To make mankind in conscious virtue bold,
Live o'er each scene, and be what they behold."

It has been pointed out by a previous writer, what a vast superiority representation or action has over bare narration; what a power the stage has to raise the sympathy of the spectator, and from that strong-working sympathy, how the passions are agitated, and catch the enthusiasm of the author. It is as a moral philosopher that Aristotle gives the preference, above all other modes of poetic imitation, to tragedy, as capable of purging the affections, by the means of pity and terror. The first endeavour of the poet should be to touch the heart, the next to mend it.

Who will assert that the persons and characters introduced into the plays of Shakespeare are counterfeit, and bear no resemblance to the minds and characters of persons we meet with in our intercourse with the world? His greatest art was the beautiful and sublime, but no less truthful, manner in which he expresses the vehement passions, a manner in which no writer in any age ever equalled him. His talents were universal, his penetrating mind saw through all characters; and, as Pope says of him, he was not more a master of our strongest emotions than of our idlest sensations.

To take an instance of his genius in delineating characters from the play of *Macbeth*, as that has been mentioned. This piece is, perhaps, one of the greatest exertions of the tragic and poetic power that any age or any country has produced and is one most conducive to the great end and aim of tragedy, viz., to bring the mind, by the operation of pity and terror to such a lively perception of the great agonies and tortures of a guilty conscience and the terrible consequences that follow wicked actions, that it may abhor the cause that led to them; and what language can be more calculated to produce such an effect than that used by the immortal bard of Avon? What a natural character was *Macbeth*!—not an *imaginary individual* of the author's brain, but one of a class. How many men, like him, may be found in the present day, of a generous disposition and good propensities, but with vehement passions and aspiring wishes, and a sub-

able to be seduced by splendid prospects and ambitious counsels. He has described, in a masterly manner, the emotions of Macbeth in the struggles of conscience, and his agonies arising from remorse; and I must think that no one, of any moderate degree of sentiment, could go to the playhouse, and witness these scenes, with all the effects that scenery and acting can produce, without coming away a wiser and a better man. Surely it is an unjust charge against this incomparable author to assert that he is guilty of false representations! It is generally acknowledged that he gives an air of reality to everything; and, in spite of many and great faults (to be attributed rather to the times than to the man), effects, better than any one else has ever done, the chief purposes of theatrical representation. Hear the character Pope gives him:—

"His characters are so much nature herself, that it is a sort of injury to call them by a distant name as copies of her. Those other poets have a constant resemblance, which shows that they received them from another, and were but multipliers of the image; each picture, like a mock shadow, is but the reflection of a reflection. In every single character in Shakspeare is as much an individual as those in life itself; it is as impossible to find any two alike, and such as from their relation or identity in any respect appear to be twins, yet upon comparison, be found remarkably distinct. To this life and variety of character, we must add, the wonderful preservation of it, which is such throughout his plays, that had all the speeches been printed, without the very names of the persons, I believe one might have applied them with certainty to every speaker."

Again, speaking of this mighty genius, he writes:—"The power over our passions was never possessed in a more eminent degree, or displayed in so different instances. Yet all along there is seen no labour, no pains to move them; no preparation to guide our eyes to the effect, or be perceived to lead toward it; but the heart swells, and the tears burst out just at the proper places: we are surprised the moment we weep, and yet, upon reflection, find the passion so just, that we should be surprised if we had not wept; and wept at that very moment." And herein lies, I think, the great efficacy of stage represen-

tations—that they possess that peculiar influence over the heart which softens it for those impressions and sentiments which it should be the object of the dramatist to instil by his writings. The heart of man, like iron and other metals, is hard and of firm resistance when cold, but warmed, it becomes malleable and ductile; and it is by touching the passions, and exciting sympathetic emotions, that the tragedian must make his impression upon the spectator. The stage, then, is the medium for warming and rendering malleable the heart, and preparing it for the reception of those higher and loftier sentiments which Christianity teaches; and it may therefore be considered truly consistent for a Christian to render support to the British stage, as the British stage renders support to Christianity.

"Aristides" again remarks, that "the workings of tragedy do not transpire till its completion, and hence none are demoralized; but in the theatre the plan is seen evolving, and the consummation of the crime is introduced to the beholder's view." This seems to me to constitute one of its advantages as a medium of instruction. Upon the stage are brought within the spectator's view, in a comparatively short space of time, events and consequences which, in the ordinary course, would take years, perhaps, to evolve, and thus the audience steal the march upon time. With the humbler classes of society, in particular, this is a great advantage: many of them have no leisure or application to trace the consequences of ill-governed passions or erroneous principles through the long series of a voluminous work, and thus the drama happily steps in for this purpose. Events are brought within the compass of a short period; precepts are delivered in the familiar way of discourse; the fiction (lawful fiction) is concealed, and representation and action take the place of cold, unaffecting narrative.

Such, then, are the true objects of the drama—to instruct in morals and philosophy, whilst at the same time it diverts. For this purpose was it instituted in the first place, and for the promotion of this object has it been patronized, during all ages, by the learned and talented. If the stage has become corrupted and degenerated from the true spirit of the drama, it is because it has been contemptuously neglected by the professors of a morbid Christianity, and has thus

fallen for its support upon the patronage of the lower classes; and whilst such is the case, nothing can be expected but an inferior and weakly order of theatricals. Woe be to the stage when the proprietors are compelled meanly to cringe to the vitiated taste of a British populace! That the stage, whether good, bad, or indifferent, must exist, is evident, for it is clear to judge, from the perusal of history, that "*a love of dramatic representation is an inherent principle in human nature*"—from the child at school, who delights in playing at kings or heroes, and acting extempore the stories which he has read in his books of amusement, even to the wild tribes of desert islands. Is it not wise, then, that a principle of nature which must have scope, should be turned into a mighty

engine for the diffusion of moral truths and maxims, as I cannot but think was intended by that Providence who has endowed the whole human family with either talents for the truthful display and imitation of the human passions, or a mind formed for the just appreciation of it. I cannot but think that all this was appointed for the purpose that some great master-mind—such as the immortal Shakspeare—should arise, and in his sublime delineations of the human character, impart instruction to the world, and thus prepare them for a more just conception of the sacred purposes of Christianity. We are apt to consider Shakspeare only as a poet; but he is certainly one of the greatest moral philosophers that ever lived.

ARISTOTLE.

NEGATIVE ARTICLE.—III.

THERE are many things which from their nature cannot be properly understood, or fairly determined to be right or wrong, until they have been put into practice. When our legislators frame new laws, it cannot be told whether those laws will entail misery or the reverse before they have been tried; the only thing that can be done is, to argue from analogy, and to draw deductions from facts which, as near as possible, bear upon the matters requiring the law. But in the present inquiry we have not to argue upon a subject the import and bearing of which we are unacquainted with; we have not to conjecture that such and such a result may follow; but we have simply to determine whether a Christian can consistently countenance a system the results or bearings of which are perfectly obvious to all.

The stage of England is a great fact; and too well known are the *habitués* of the theatre, and too painfully visible are the immoralities attached to the same, to permit the use of anything like conjecture while arguing either for or against the stage. C. W. has assumed a very sophistical position in this debate, by trying to make it appear that the stage, if it is not, might be, a teacher of religion and morals. I must remind our friend that we have now nothing to do with what might be made of the stage; we have simply to determine whether the God-fearing and the God-honouring man can consistently support it. I at once join

issue with our skilful friend, and affirm that no Christian can countenance a theatre: and whence do I draw my reasons for so bold a conclusion? First, from inspiration. God says, "Whatsoever ye do, do all for the glory of God;" and in the second place, the evils and immoralities attached—necessarily attached—to theatres, are so glaring, that no unprejudiced beholder can fail to see them. Who ever thinks of going to theatres to honour his God? Who ever goes upon his knees before entering their precincts, to ask God to bless his soul by what he is about to hear and see? If men never think (and they dare not) of asking God to give them his blessing in a theatre, how can a Christian be consistent when found there?

C. W. is very bold in his assumptions; by his quotations from the poets he wishes us to think that there was a time when men really went to a theatre with a holy intention—when theatres were indeed schools of virtue and religion. Either C. W. is very ignorant of the true history of the English and every other stage, or else he does not present what he knows. Let him, if he can, point out that golden age. It was not in the time of Dr. Johnson, as "Aristides" has clearly shown; it was not in the age immediately before him; vainly do we strive to find it in the time of the Stuart kings. Hear what Tillotson says about it in his days:—"As the stage now is, plays are intolerable, and not fit to be permitted in an

much less christian, nation. They notoriously minister both to infidelity. The golden age was not in the age so far-famed Shakspeare. I am not uritanical as to miss the reading of it; but neither am I so carried away by the force and splendour of his wit and wit that I can dare venture to say that our great bard is a dangerous example to read, and many of his plays not exhibited as he wrote them.

To show, by a brief summary, that I cannot point out the time when the stage was pure, I shall refer him to the famous William Prynne wrote in 1633 of Charles I. He made a catalogue of crimes against theatres, which included every name of note in the christian world; comprehending the united efforts of the Jewish and christian law; the deliberate acts of fifty-four ancient and modern general, national, and provincial councils and synods, both of the eastern and western churches; the contrary sentence of seventy-one ancient and one hundred and fifty modern catholic and Protestant authors; the hostile efforts of philosophers, and even poets; the legislative enactments of a great number of pagan and christian states, emperors, magistrates, emperors, and princes. Now, is C. W. to point out his golden age, or challenge him to produce it. But I need not, and say Prynne was a puritan, of whom C. W. evidently knows but little against whom he has imbibed very able prejudices. But be this as it may, if these are facts, let them come from their source.

If C. W. should shift his ground, and accuse ancient nations for his pure stage, I refer him to some of the opinions of the wisest men of antiquity. Plato says, "Theatres raise the passions, and pervert the morals; and of consequence are dangerous to morality." Aristotle says, "The representation of comedies ought to be forbidden to people, until age and discipline have rendered them proof against debauchery."

Seneca says, "The German women are preserved against danger, and preserve their modesty having no playhouses among them." A grave work addressed to the Emperor Augustus, advises the suppression of all amusements, as a great source of

corruption. It would be possible to swell out this paper to a volume with quotations from ancient and modern writers, all condemnatory of theatres and anything of the kind, but the above will suffice. We pass on to notice some other parts of C. W.'s remarkable paper. He tells us that he traces the origin of the English stage to the clergy—a most unfortunate origin as far as its purity is concerned. It is notorious to the students of English history, that no set of men were more depraved or immoral than were the English Popish clergy at the time our friend mentions. This being so, can it be possible that their plays would be more pure than their lives and their religion? Surely, surely, C. W. does not mean to tell us that the Popish priests of England in 1170 and preceding ages were christian men—men from whom Christians of this century do well to take their pattern. If their plays were as pure as their faith, God preserve us alike from either. A mere tyro knows that the most abominable blasphemies, and the most corrupt practices, were openly practised and allowed as parts of religion, by those very clergy whom C. W. tells us introduced the drama into England. This being so, it is small wonder that our present theatres are dens of infamy and vice, knowing from what a detestable source C. W. tells us they spring.

C. W. next attempts to show us what Christianity is, and here he is as far away from the truth as when he tries to show us that the origin of the stage was pure. He evidently wishes us to understand that Christianity permits a man to make himself familiar with vice, in order that he may learn to shun it: and in doing so, for his purpose, he makes a most unfortunate quotation, viz. :—

"Vice is a monster of so frightful mien,
As to be hated needs but to be seen."

But we deny his inference altogether, and likewise prove, from the following lines of the same poem, that the poet was far from teaching the same doctrine as C. W.: hear him—

"Yet seen too oft, familiar with his face,
We first endure, then pity, then embrace."

The truth of the last two quoted lines is painfully obvious to all who have studied

London life. Nearly all men agree, that it is the familiarity with vice which develops all the immoral and vicious propensities of human nature. What, then, becomes of C. W.'s boasted assertion, that the exhibition on the stage, of what he mildly terms "scorn," will lead men to shun vice? Let him, if he can, point to a single individual who ever became a more moral man by witnessing the representation of vice. I will tell him what the sick comedian once said, and may we weigh well the significance of his words:—"I have been acting Sir John Falstaff so often, that I thought I should have died; and had I died, it would have been in the service of the devil." If the stage were good, its good effects must be soonest felt by those who have most to do with it. Is it so? Is it not, rather, notorious that, with only a few exceptions, actors and actresses are shamefully immoral? What vice, what depravity, what corruption, disgrace the green-rooms of our principal theatres, to say nothing of those lesser hells, the minor theatres of our great towns.

"In whatever aspect we view the stage, it possesses no claim upon our sympathies, inasmuch as it ever has been the engine of falsehood, the propagator of vice, and tended to degrade and make licentious the people."

C. W. says truly, "It has undergone no change by which it forfeits its former claims," and for this reason we warn all Christians to keep aloof from the polluted thing. We have shown—at least, the quotations we have adduced have—that plays have ever had an immoral tendency; and the present condition of the drama clearly enough demonstrates, that theatres are the very strongholds of sin. How, then, we ask, can C. W. consistently uphold the doctrine, that Christians may support them?

Show me the country and the age where theatres are most in vogue, and I will demonstrate that that age and that country bear upon their front the impress of the greatest amount of sin. One fact alone shall be sufficient to attest my assertion. During the progress of the most blasphemous and ferocious revolution which ever shocked the face of heaven, theatres, in Paris alone, multiplied from *six* to *twenty-five*. Now, one of two conclusions follow from this: either the spirit of the times produced the institutions, or the institutions cherished the spirit of the

times; and this would certainly go to prove that they are either the parents of vice, or the offspring of it. Such being the state of the case, we shall offer C. W., and those who may understand Christianity as he seems to do, a few remarks from the word of God, to prove that a Christian dare not be found to countenance the stage. David says, "Blessed is the man that walketh not in the counsel of the ungodly, nor standeth in the way of sinners, nor *sitteth in the seat* of the scornful," Psa. i. 1. And again: "I have not sat with vain persons, neither will I go in with *dissemblers*," Psa. xxvi. 4. Now, what is there but vanity and deceit upon the stage? Would David, would Christ, would the apostles and prophets, if on earth, countenance the stage? I trow not. Neither can Christians, who are the servants of Christ, defile themselves by countenancing the polluted stage. But one or two more extracts will suffice to show that the word of God calls upon us to keep ourselves separate from the godless throng who serve the devil by dancing attendance upon the stage. "Enter not into the path of the wicked, and go not in the way of evil men. Avoid it, pass not by it, turn from it, and pass away," Prov. iv. 14, 15. See 1 Cor. v. 9—11; 2 Pet. iii. 6, &c. We feel that we have laid ourself open to be called a puritanical dreamer, and that we would cut men off from all harmless enjoyment. We deny the truth of such an implication. If C. W., or any one else, can show that plays were ever any other than vicious in their tendency and effect, and that they may be made so again, then, and not till then, shall they have one iota of our support. Christians are not prevented from rejoicing; neither have they one whit the less enjoyment, though their principles prevent their indulging in the sinful charms of the stage. They know that to learn what virtue and vice are they have not to seek the instruction of the stage. No, the fountain of all virtues is ever welling up before them, and to its pure and hallowed springs they go for their copious draughts, and there they discover what virtue is, by reading the sayings and doings of Him who was virtue's God. Yes, from the lips and life of Him, who spake as never man spake, the Christian draws his lessons of holiness and love, and loses nothing by neglecting the lessons of the stage. And to

know the hideousness of vice, the Christian is not indebted to Shakspeare, ever so well acted. No, no; Shakspeare never did, and Shakspeare never could, teach to man the corruption of the heart within him one-tenth part so clearly as it is to be seen portrayed in the revelations of the word of God. Go, then, C. W., and study that precious book; and soon, very soon, will you learn what folly it is to run to the mimic acting of poor, erring men for your patterns of vice or virtue, when such a precious and infallible monitor is ever at your command.

A few words with H. T., and we have done. None can fail to see that he is a clever, and when his subject admits, a powerful writer; but, unfortunately for his credit, in the present instance he can only use words to hide or smother facts. What is the intention of his dulcet strain? Why, simply to break down the hedge which separates the Christian from the ungodly; he wishes to see the christian church dovetailed into the world, and thinks that such a proceeding would tend to make both parties better and happier. If H. T. were endowed with infallible wisdom, and could prove it, his reasoning would command attention; but so long as his argument runs in opposition to God's truth, we must treat it with the neglect it deserves. H. T. is evidently one of those who, having some faint notions of christian truth, allow their fancies to usurp the place of inspiration. Well would it be for such men, if they would study what St. Peter means in his first Epistle, ch. 11, 12—"Dearly beloved, I beseech you as strangers and pilgrims, abstain from fleshly lusts, which war against the soul," &c.

H. T. evidently thinks that it is morose for a Christian to account himself only a stranger and pilgrim on earth;

but we must allow the Author of Christianity to be a better judge of what is consistent in a Christian, than a thousand reasoners such as our friend H. T. He seems to forget that a Christian's hopes are in heaven, that his joys are not centered here below. Like too many others, he seems to imagine that religion, while it prevents an indulgence in sinful delights, gives no joys in return. Has he never read how St. Paul, amidst all his manifold trials and sufferings, went on rejoicing? Had he any need of the gewgaws of the stage to make life tolerable? For him to live was Christ; to die, gain. When H. T. knows personally what St. Paul did, then, and not till then, will he understand why the stage is not worthy of a Christian's patronage.

What a mistake the worldly fall into when they think that Christians have no pleasures here below! They forget that the whole world is theirs; that temporal things subsist only for the advantage of Christians; and that when Christ has gathered together his elect, this world will cease to be. What folly to imagine that that man's happiness can be enhanced by the mimicry of the stage, who delights in the works of his God! What need for the lessons of the stage, when the Christian has the book of inspiration, the book of nature, and the book of history from whence he draws all he wishes to know? Such a one cannot waste time to see nature caricatured in the playhouse, but learns to admire virtue and abhor vice, because the universal teaching of his God commands the latter and commends the former.

Having run this paper to an unusual length, we have only room to say how much we admire the reasoning of J. E. P., and how strongly we commend it to our opponents.

W. T.

HISTORY is "the record of God's providence getting himself honour out of man's sin." Civil polity has to do with those relations, social and national, which have been divinely appointed for man; he did not invent them. Science investigates and applies those laws of nature, and properties of the external world, according to which all things have been ruled from the beginning. Art, aesthetically considered, is but the reproduction and reconstruction of images of the mind, and forms of natural beauty, whose original is beyond all earthly claim. Philosophy is concerned with the structure of the intellect, with its operations, and with man's relation to the material world in which he is placed.—*British Quarterly Review*.

Philosophy.

IS WOMAN MENTALLY INFERIOR TO MAN?
INTRODUCTORY ARTICLE.

A CORRECT answer to this question must be based on a very comprehensive and accurate knowledge of the human mind. This paper will contain only a few suggestions and facts which may assist in further inquiries. It may be presumed from the unqualified form of the query, that it is not meant to be partial, merely having reference to a few mental powers; nor should we consider it as meaning, "Is woman's mind equal in all respects to man's?" for it may be that both have points of superiority as well as inferiority. What I understand by the question is, taking all the peculiarities of woman's mind and all the peculiarities of man's, and comparing the total of the one with the total of the other, which stands the nearest to the point or standard of perfection?

What, in the *first* place, is meant by **PERFECTION**? The term is either *relative* or *absolute*. *Relative* perfection in human beings consists in their complete adaptation to their proper spheres of action. Viewed *absolutely*, degrees of perfection consist in the adaptation of different individuals to more or less elevated spheres of action. In the first sense, there can be no doubt that the Creator has

made woman as perfect as man, and man as perfect as woman, and every inferior creature as perfect as human beings, i.e., all are exactly adapted to the spheres in which they are intended to move. Here, then, there can be no dispute. The question is, rather, Is woman *absolutely* as perfect as man? Man may possibly be capable of undertaking more numerous, difficult, and exalted duties; or woman may have the pre-eminence in these respects; or they may stand on an equal footing with each, although engaged in different spheres of action. In prosecuting the inquiry, it is desirable to take a general view of human nature as regards *mind*, which must be understood to act, in this *life*, through the medium of the brain. The capabilities of mind are chiefly dependent on five principal attributes—capacity, form, tone, temperament, and texture. These are modified by age and circumstances in every individual. But it is only with the attributes themselves that we have at present to do. Five degrees are exhibited in the following table; the lowest degree being represented by 1, and the highest by 5.

	Capacity.	Form.	Temperament.	Tone.	Texture.	
5	Very great	Very excellent	Very active	Very vigorous	Very fine	5
4	Great	Excellent	Active	Vigorous	Fine	4
3	Medium	Medium	Medium	Medium	Medium	3
2	Small	Inferior	Inert	Feeble	Coarse	2
1	Very small	Very inferior	Very inert	Very feeble	Very coarse	1

As this arrangement is not to be found elsewhere, and the terms are too general to convey ideas sufficiently definite, a few explanatory observations are necessary.

Capacity, when applied to the intellect, means power of comprehension; *great capacity*, the power of laying hold of great ideas. When applied to the feelings, great capacity means depth of emotion, strength of impulse, and is dependent on a large development of the brain. The average of men's brains is 3 lb. 8 oz., of women's, 3 lb. 4 oz. *Excellence* of form consists of that happy balance of the faculties, that none so far predominate as to interfere with the legitimate action of the others. This harmony of the faculties is in a great measure

dependent on the form of the brain; but may co-exist with considerable variations of form, adapting different individuals to different spheres of duty. Man seems to have generally a greater proportion of intellect and animal energy, woman more of social and moral feeling. I do not think there is any one standard of perfection as to *form*. No one form can be adapted to all duties, or this would be the perfect standard. The difference of form in man's and woman's heads does not necessarily imply inferiority on either side. The term *temperament* I have used in a sense more exclusive than that usually attached to it, as simply comprehending the different degrees of activity and inertness. There seems to be no essen-

tial difference between men and women as to activity of mind. *Vigour of tone* is highly important to enable us to endure long-continued mental exertion with impunity. Woman's present inferiority to man in this attribute seems to be an accidental condition, which will be removed by attention to the laws of health. The vigour of some women seems to be equal to that of the most robust men, especially among wandering and savage tribes; which shows that feebleness is not an essential part of her character. The last attribute is *texture*. Here woman may most decidedly claim superiority. It gives her the advantage in appreciating whatever is delicately fine; in doing whatever requires delicacy of touch, of thought, and of feeling. It is conspicuous in her features, and of itself sufficiently distinguishes the feminine character from that of the "coarser sex." It will now be readily understood that according to my conceptions of a really superior or positively excellent character, it consists of a combination of these attributes, all above medium; and that a character inferior in every respect is one in which all these attributes are below medium; while an individual with attributes all medium, has but a medium character. But these attributes are more commonly combined in different proportions; thus, 4, 4, 3, 2, 2, may represent their proportions in one character, but the sum of these will be the same as the sum of 3, 3, 3, 3, 3, all medium, constituting a medium character, characterized by the number 15. Another character may consist of a combination of attributes, represented by 5, 4, 4, 4, 3; this would be among superior characters, its characteristic number being 20. Now, if we can prove that the characteristic number of woman's character is equal to that of man's, we shall prove her equality.

Man reads in history of many superior specimens of his own sex, and he is impressed with the greatness of *man*. He looks around him and sees women of comparatively inferior order, and the impression on his mind that the female character is much below the male standard is perfectly natural. But it is not just to take men who are superior compared with their fellow-men, and compare them with women who are inferior among women. It would appear more just to take the average of each sex and compare

them with each other; this would lead to a more correct conclusion as to existing facts. But these averages have not yet been ascertained; and I am not sure that a conclusion drawn from such averages would truly answer the question, which seems, from its unlimited nature, to refer to the essential characteristics of man's and woman's minds, rather than to their present accidental condition—to what they are severally capable of, rather than to their present actual attainments. Past circumstances may have tended to develop the peculiar excellences of man more than those of woman. Society is to the moral and intellectual being what climate is to vegetable existences; and exerts a deteriorating or healthful influence on individuals, according to its adaptation, or want of adaptation, to their primitive constitutions.

For these reasons we must turn from the actual to the possible condition of woman, and learn, so far as science will teach us, to anticipate to what point woman will rise under circumstances most favourable to her development, and compare her, thus perfected in her highest degree, with man when he is similarly perfected by circumstances equally adapted to his nature. Those who have not the power to do this are not in the position to form an unerring judgment on the subject—they are exceedingly liable to mistakes. The peculiar excellences of woman, viz., her superior moral sentiments and social feelings, combined with fineness of texture, fit her in an especial manner for the highest of human duties—the exercise of moral influence or control over the passions of others.

The government of mind is as superior to the government of matter, as *mind* itself is superior to *matter*. To prove, then, that woman is more eminently fitted for the exercise of this influence, is to do much towards proving that her mind is superior to man's; fitness for exalted duties being a sure test of superiority of mind. A few examples of woman's power in this respect must suffice.

George Combe mentions, that when in America he visited a school conducted by a gentleman and his wife conjointly, and that whenever the former found boys too difficult to manage he sent them to the latter: by this means all corporal punishments were superseded. Other schoolmasters are imi-

tating this example with equal success. The masters themselves feel the beneficial influence of the presence of females in their schoolrooms, by its enabling them more effectually to control their own tempers. Again, in the "Edinburgh Journal" for September, 1845, there is an account of an asylum for the upper classes, conducted by a physician and his wife, where physical force is superseded by moral influence; and not only does the lady exercise a genial influence over the whole establishment at all times, but when the patients are too turbulent for others to control an appeal is made to her; and her influence is so great as to command invariable obedience. And so greatly is she loved and respected, that nothing delights the patients more than to find some opportunity of doing her some little service. These individual instances are only given as illustrations of a new application of a power extensively possessed, but long allowed to lie dormant or run to waste.

If turbulent boys and madmen can be thus easily controlled by woman's influence, what may it not effect when society shall be based on the principle of moral influence—when woman shall be allowed and incited to use this her mighty power in improving the condition of her race? Society has been organized in accordance with the views of *man*, on the principle of *physical* force; this *he* has found to be more easy to wield; at least, so he has thought and so he has acted. It is an essential principle of barbarism. Man in barbarian society is, therefore, pre-eminent and woman degraded; because the former possesses the greater physical power and animal energy.

Amidst the turmoil of opposing physical forces and animalism, woman has not had physical force to maintain an equality of position, or such a degree of freedom, as is essential to the development of her peculiar excellences. Society is, at first, barbarian in its principles. The ancient Jews were a barbarous people, as the orientals have always been, and still are: and this is quite a sufficient reason why so little is said of woman in bible history. Much of barbarism still lingers among us; our laws have, to a great extent, been copied from those of the Romans (an essentially barbarous people), and woman is not free; she is degraded by

dependence and subjection, and often marries those she cannot love for little else than to ensure a supply of daily bread; and haughty man pleads his right to domineer from "*the curse*," as it is termed, pronounced on woman immediately after the fall, as if that conferred on him the right to tyrannize, which he did not before possess. This is not Christianity. Christianity is intended to restore both man and woman from the effects of the fall to paradisiacal perfection and harmony. As this state gradually returns, woman will be elevated more and more in her social position, till she takes her proper sphere, where she will exercise extensively the most potent of all social influences, *gentle yet omnipotent*.

Those who do not understand the nature of moral influence, can never appreciate the character of perfect woman, nor understand her proper duties or true position in our world. Man is too material in his notions, and we must wait till greater spirituality of thought is developed by him, ere we see him entertain just conceptions of woman, with the spiritual nature of her duties. To suppose that woman is merely a domestic animal, governed almost exclusively by "*domestic instincts*," is a great mistake. Most women will undoubtedly choose domestic duties when left perfectly free in her choice; but she will not choose to be, as she now is in the middle and lower ranks of society, a slave to them. Here in England she is forced into the domestic sphere of duties, and kept there by circumstances whether she will or no: in France she is forced out of it; *men* are the domestics. I ought not to dismiss this question without adding something more on woman's intellectual powers. In society we find a great many women who are superior in intellect to men with whom they are connected, engaged in the very duties which nature or custom has assigned to man. These may be considered by some as *exceptions*, though not rare ones. Our proper question is, Will woman's intellect be equal to man's, when both are equally perfected? I do not know any woman who advocates perfect equality in this respect. There are yet many instances on record of intellectual women, which point to a highly respectable position as attainable by females. A few instances must suffice.

Madame de Staël, a French authoress of

celebrity, whose talents were so early displayed that she is said "never to have been a child," from her twentieth year took an active part in literature, and an almost equally active part in politics. And so great was her influence in the political world, that on her opposing Napoleon's government in 1801, he thought it necessary to issue an order for her to quit Paris; and on her return she was again expelled. Her works amount to seventeen volumes.

Lady Hester Stanhope, a near relative and great assistant to the celebrated William Pitt, was another female of strong intellect and "masculine" energy. An account of her may be seen in "Chambers's Edinburgh Journal," 23rd August, 1845, page 117.

Mrs. Carter, an intimate of Dr. Johnson, and also of the most literary characters of that age, acquired the Hebrew, Arabic, Greek, Latin, Italian, Spanish, French, Portuguese, and German languages. She was a translator and poetess.

Anne Dacier, a French lady, who died 1720, "was deeply learned, and an eminent translator of the classics." The greater part of her life was spent in "literary labour," in conjunction with her husband. It is said, greatly to her honour, that though deeply learned, she in society carefully avoided any display of learning, and in all the relations of private life her conduct was exemplary.

Olympia Tulvia Morata was one of the earliest and brightest ornaments of the Reformation. She could declaim in Latin, converse in Greek, and was a critic in the most difficult classics.

Lady Jane Grey, too, evinced great taste and capability for study; besides which, she understood Greek and Latin, with some modern languages. This was not from the

example of most of the friends and relatives by whom she was surrounded—they were directly opposed to her in their tastes: to use her own language, "they never knew what true pleasure meant." But she had other greatness which I am inclined to admire more than learning,—she had great moral worth and fortitude, acting on the most trying occasions from motives of principle and duty. These are excellences in the female character which, when manifested, cannot be too highly valued and praised, but on which I shall not now dwell, or allusion might be made to Mrs. Judson, Elizabeth Fry, and others, whom I have never heard of as being *learned*, but who are eminently great in my eyes, more so than a large majority of men. Rosa Govona is another, vide "Edinburgh Journal," August 23, 1845.

Salade, in a small work on Astronomy, enumerates a considerable number of females eminent as mathematicians and astronomers. Herschel's daughter assisted him greatly in his studies and calculations. Such facts are valuable, as proving that woman's intellect is not essentially and necessarily of such a contemptible order as some men seem to think. Yet they are not of themselves sufficient to decide that woman's mind is equal to that of man's. Greater mathematicians are to be found among the latter.

The final questions are, Does not woman's *moral* excellences and *moral* influence compensate for the want of an equal amount of intellect with some men? And do not the duties of a moral nature, especially enjoined on her by the Creator, imply equality with man in regard to excellence of mental endowment?

NEGATIVE ARTICLE.—I.

"May may the sterner virtues know,
Determined justice, truth severe;
But female hearts with pity glow,
And WOMAN holds affection dear;
For guiltless woes her sorrows flow,
And suffering vice compels her tear:
'Tis hers to soothe the ills below,
And bid life's fairer virtues appear.
To woman's gentle kind we owe
What comforts and delights us here;
They its gay hopes on youth bestow,
And care they soothe, and age they cheer."
CRABBE.

It is strange to contemplate the many

pranks which PRIDE and PREJUDICE are continually playing with mankind; and it is no less strange to reflect that the victims are not unfrequently found amongst those who would wish to be thought the great and wise among men. In fact, if each of us could only be induced to take the trouble to examine well our own creed, and strike out from the tablet of our belief all such notions as have gained a place there through the instrumentality of one or other of these

passions, we should find ourselves much better and more rational beings through the process.

Take an instance in point. Man has been *told* from his earliest years that he is *mentally* superior to woman. *Pride* jumped at such a flattering conclusion, and urged him forthwith to style himself "lord of the creation;" and *Prejudice* forbade him to inquire into the truthfulness of the claim, lest it should be found wanting. The point has, therefore, among many others, been deemed settled.

Now, we object to the practice of adopting conclusions based upon no better grounds than mere assumption. We have, on more than one occasion, in these pages, pointed out the folly of such a course. And, before now dismissing the subject, we would recommend the following brief rules:—1st. Never reject anything *merely* because it is *new*. 2nd. Never put implicit reliance in a thing *because* it has the claim of *antiquity* on its side.

We propose to apply these principles of investigation to the question now before us, and pledge ourselves to abide by the result. We shall, in the present paper, state our own convictions and our reasons for them; and if our opponents think we are in error, let them set resolutely to work to convince us that we are so.

It has occurred to us, that certain "lords of the creation" must sometimes find themselves sorely puzzled at the position in which they place themselves: we mean those who, while under the influence of a certain prevalent epidemic, called LOVE, have fallen down before, and even worshipped at the feet of, beings whom, in their calmer senses, they consider far inferior to themselves! But we will not, so early in the scene, introduce any "awkward insinuations."

The grounds upon which woman's mental inferiority to man is alleged, seem neither to have been clearly defined nor understood. We have heard it sometimes argued, that as woman was designedly created weaker than man in physical strength, so she was *intended* to be inferior to him in mental power. This is unquestionably a very *simple* argument in more senses than one. If mental capabilities are to be judged by the standard of physical strength, what mighty achievements might be expected from giants! And

how strange that they should be known to the world only by their Jack-and-bean-stalk doings! But we may pass on. Others there are who jeeringly point to history, and ask to be introduced to the recorded actions and accomplishments of patriots and heroes in the female line. Leaving out scriptural record, where woman is ever found foremost in charity and all good works, we may dismiss this objection by saying, that many of the noblest and most heroic deeds which stand recorded on the world's life-history have been accomplished either by, or at the instigation of, woman. But the most frequent and, at first sight, most plausible argument is, that we seldom observe in woman any manifestation of *those higher* intellectual powers which are so common in man. Where, ask these objectors, are your female painters, sculptors, poets, writers of fiction, inventors, designers, &c.? Now, as this seems to be the stronghold of our adversaries, we shall devote more especial attention to it.

Phrenologists have told us, and philosophers have failed to disprove the assertion, that the organs of the brain, the seat of the mind, is divided into *three* distinctive classes, each of them occupying a separate region, and each of them exercising a greater or lesser influence over their possessor, according to their relative preponderance or otherwise. These are usually denominated—(1) the HIGHER INTELLECTUAL, (2) the MORAL, and (3) the SOCIAL groups or faculties. Thus, according to our development, in these several regions shall we exhibit intellectual greatness, as ordinarily expressed, moral power, or social virtues. These faculties, although thus distinguished, are all component parts of the mind in its entirety. Thus, when we speak of *mental power*, we speak of them all conjointly.

Now, it is well known that in women the *social* faculties, at least, preponderate, while the *moral* faculties are, at least, equal; the deficiency therefore being in the intellectual or perceptive faculties. The consideration of these facts will at once explain *why* the mental capabilities and achievements of women present themselves in different forms and under different aspects from those of men. To make this part of our subject more clear, we have prepared and affixed a scale, intended to represent the relative

development or mental power of men and women in the several divisions before specified. In the first, that is, the intellectual department, *man*, as we have before stated, excels; in the second—the moral development—the sexes are *equal*; while in the third, or social organism, the woman has the preponderance. Now, if a line be drawn from the division *a* perpendicularly, it

becomes apparent that what the woman lacks in the intellectual region she compensates for in the *SOCIAL* region. Herein we arrive at the true solution of the problem, which is, that in the sum the mental powers of man and woman are *equal*, although not *IDENTICAL*. Our next step is to elucidate the correctness of this conclusion, and to show how completely it harmonizes with

a

MAN.	WOMAN.
Intellectual.	Intellectual.
Moral.	Moral.
Social.	Social.

all we know or could desire concerning women.

It is the mission of woman to cultivate and excel in the *social* virtues. Poets, authors, philosophers, divines, have all told us so again and again. Listen to a few of their testimonies.

Crabbe says:—

“While the sterner sex disdains
To soothe the woes they cannot feel,
Woman will strive to heal his pains,
And weep for those she cannot heal:
Hers is warm pity’s sacred glow,
From all her stores she bears a part,
And bids the spring of hope reflow,
That languished in the fainting heart.”

Gibbon observes:—“In every age and country the wiser, or, at least, the stronger, of the two sexes has usurped the powers of the state, and confined to the other the cares and pleasures of domestic life.”

Maunder beautifully adds:—“Born to feel and inspire the tender affections, it is the fault of man if well-educated females become not the grace and ornament of society. ... Woman is the *equal* and companion of man—not the plaything of his caprice, nor the slave of his passions. When unpolluted by the breath of sensuality, and unattacked by the more insidious venom of seductive adulation, if in youth her mind has been properly directed, her character will stand forth in all the majesty of native dignity—is all the grace of virtuous simplicity. With

such a being pictured in his imagination, well might the poet exclaim:—

‘Oh! she is all that soul can be,
One deep undying sympathy.’”

Again we find Crabbe exclaiming:—

“Thus in extremes of cold and heat,
Where wandering man may trace his kind,
Wherever grief and want retreat,
In *woman* they compassion find:
She makes the female breast her seat,
And dictates mercy to the mind.”

And in Mr. Ledyard’s words, as quoted by Mungo Park, we find a full confirmation of the truths which the poet thus expressed. He says:—“To a *woman* I never addressed myself in the language of decency and friendship without receiving a decent answer. If I was hungry or thirsty, wet or sick, they did not hesitate, like men, to perform a genuine action. In so free and kind a manner did they contribute to my relief, that if I was dry I drank the sweetest draught, or if hungry, I ate the coarsest mouthful with a double relish.”

There is only one other social aspect in which we wish now to speak of woman, and that is in the intensity of her *LOVE*. It is here that she stands pre-eminent and unapproachable. Man may love ardently and honourably, but it is not in his nature, and therefore he cannot manifest that intense and enduring love which is woman’s birth-right, and, we hope, her pride.

"Man's love is not so wonderful as woman's!
 He with an ardour not to be restrain'd,
 Pours forth the riches of a noble heart
 In passionate excess; yet in the pause
 That lies between the seasons of its power,
 High duties and pursuits of honoured name
 May win him to a short forgetfulness.
 Her passion is not such! The breath she
 breathes
 Is not more certainly the life of life
 Than her quick flowing thoughts the life of love!
 Her heart is in her hand, her eyes, her ears!
 Her ears take in all music, but to her
 It has one burden, and repeats one name!
 No sorrow can suppress it, or destroy
 This woman's love."

The Italian Captive.

Festus, in illustration of woman's love, says:—

"I have seen all the woes of *MAN*—pain, death,
 Remorse, and worldly ruin; *they are little*,
Weighed with the woe of woman, when forsaken
By him she loved and trusted."

But even poets must fail to depict the fulness of woman's love in its noblest manifestation—we mean in the house of adversity, affliction, and distress. It is then that she rises, as it were, out of herself, puts on the garb of a ministering angel of mercy, "and sanctifies the solemn halls of death."

But time and space both prevent us doing justice to our cause. Hour after hour could we adduce fresh instances of the influence of woman in promoting the *social* happiness and *moral* well-being of the human family. We think life would be unbearable without the presence of woman; and often have we sympathized with the exclamation of Campbell, when referring to Adam's position before the creation of Eve:—

"*The world was sad! the garden was a wild!*
And man, the hermit, sighed till woman smiled."

Let us not, then, decide hastily upon this question. Those who have had the advantage of a mother's instructions will not be likely to offer a sentence adverse to the mental claims of woman on the principles we have laid down. Think of a *home* without the presence of that being who, as

"Light intellectual, and full of love,"

is ever making our cares her own, our pleasure hers, and our happiness the object of her life!

Again, what startling facts could we place before the eyes of those who assert that *literature* owes nothing, or but little, to

woman! Even not mentioning the poems of Mrs. Hemans, or the writings of Hannah More, Mrs. Opie, Miss Martineau, Mrs. Ellis, and a thousand others, look at the indirect or, rather we should say, *unseen* influence of woman. How often do we find it recorded in the lives of great authors that their wives, their sisters, or their mothers gave the last finishing stroke to works which have afterwards gained for themselves a high place on the pinnacle of fame! Therefore, although women are not to be expected, for the reasons we have stated, to shine in intellectual attainments equally with men, yet they are not to be denied "honourable mention" for that which they have accomplished. It should also be remembered that, as a general rule, they have not yet received those educational advantages which the male sex have. In fact, we want a more scrupulous attention and regard to female education,

"To show us how divine a thing
 A woman may be made."

The conclusion, then, at which we arrive is, that in her sphere, and ever bearing in mind that *diversity* of power is *no* proof of inferiority, *woman* is in no way mentally inferior to man. She possesses equal mental energy and power, but manifests it according to the different position her divine Creator ordained her to occupy in the great drama of life.

We feel that poetry is so closely associated with the subject of woman, that we have made no hesitation in freely borrowing from the poets, and we will now conclude as we began, by a poetic tribute to woman's greatness, goodness, and beauty:—

"Behold the fair creature, how gorgeously bright,
 By innocence clad in a vestment of light;
 Around her a halo of glory is shed,
 A rainbow of promise encircles her head;
 Her smile like the sun, her tears like spring
 flowers.

Caressing, refreshing the glad infant hours.
 Her zephyrus step scarcely kisses the rose,
 Her lips' ruby caverns rich treasures disclose;
 On her movements affection and tenderness wait,
 She has wealth like a diadem'd queen in her
 state.

Engifted by nature, ennobled by birth,
 She comes to bring gladness and love upon
 earth.

"Tis woman, the crown of creation's vast plan,
 'Tis woman, the friend, wife, and help-meet of
 man."

C. W., Jun.

AFFIRMATIVE ARTICLE.—I.

"Woman, beauty is thy power!"

We will not dwell on the interest which is involved in the discussion of this question; although, to a certain class of our transatlantic friends, it is paramount. By them the issue of the interrogation is no longer dreaded, for it is unalterably fixed. Such is not the case in deliberative Old England. Hence this *debut*.

It is scarcely necessary to premise that our conclusions must be based on the postulation of the Baconian view of superiority being taken as the standard by which this case is to be decided. By "Baconian view" we refer to the "fruit" or "vintage" test of that philosopher. For, in the event of inquiry not being prosecuted in accordance with that postulate, it is clear the question verges into neutrality, or else it loses that character which is indispensable to definite answering. Because, proceeding in the discussion with any other aim than that of deciding the query by means of comparing the "products" of the two opposing minds, would be to proceed on the supposition that other than these means were in existence, and should for this purpose be employed. Removing consideration of the palpable results of the respective minds is precisely the same as taking away regard for the power of a machine while calculating the amount of labour that it will perform. There is no way of estimating the superiority of one machine over another, or of one mind over another, but that of concisely accounting for the labour which it performs, the effects, the "fruits," which it produces.

Neutrality, therefore, would be the only remaining ground of debate. To advocate on this ground, we must show that, in the mind of man and of woman, there is not such an approximation towards identity as would enable a comparison of reciprocal powers to be effected, and hence, which would warrant decision on the affirmative or on the negative of the question at issue.

The point of controversy then is—Has woman or man wrought the greatest mental achievements? Which has produced the most weighty evidences of intellectual superiority? Are the chief literary productions,

mechanical inventions, and scientific discoveries, to be, by the voice of majority, awarded to woman? Surely there is no approach to probability here. To whom belongs those works in which highest mental excellence and precision of physical toil are combined? It would, we think, be almost preposterous to attempt to *reply* to these interrogations. Even the Amazonian "Kate" says with indignation—

"Why are our bodies soft, and weak, and smooth,
Unapt to toil, and trouble in the world;
But that our soft conditions, and our hearts,
Should well agree with our external parts?"

Though it is utterly wrong to assume that the "fair" are of such intellectual and physical properties as to be capacitated for being identified with

"Such stuff
As dreams are made of;"

yet we certainly believe that Cowper has *nearly* typified an ideal in accordance with the "Eve" of the paradise-Miltonian, when he says—

"Composure is thy gift;
..... devote thy gentle hours
To books, to music, or
To weaving nets for bird-alluring fruit,
Or turning silken threads round ivory reels."

In reference to mental superiority alone, surely there cannot be matter for contest and doubt. This assumption, it may be urged, is ungallant. But our inquiry is now to ascertain undisguised truth or philosophical accuracy: this fact forms an all-sufficient excusative plea. We cannot echo but one reply—Man. Look at the fruits! Are they not the evidences? and do not these preponderate against woman? We take up a review of the fact. In their province the power of woman's mind is, perhaps, peculiarly adapted for elimination. But Shakspeare is now as "incomparable" as he has ever been. The only "fair" on whom his garment can be supposed, by his most insidious depreciators, and woman's most enthusiastic mental admirers, to have fallen, was that contemporary of Sir Walter Scott, of whom he said—

"She, the bold enchantress, came,
With fearless hand and heart on flame!
From the pale willow snatched the treasure,
And swept it with a kindred measure,

Till Avon's swans, while rung the grove
With Monfort's hate and Basil's love,
Awakening at the inspiring strain,
Deemed their own Shakspeare lived again."

Ben Jonson, Congreve, and Sheridan; Keats, Coleridge, Shelley, Byron; Milton and Wordsworth; Chaucer, "the father of English poetry,"

"The blind old bard of Skio's rocky isle,"

with the thousand others, have no compeers. Where is the necessity or utility of dwelling longer here? Wherever the "lesser orb" casts her shadow, it is but to be eclipsed. Until doubts arise with regard to the superiority of the mental power displayed in the works of those whose names we have enumerated, the chief point—that of literary merit—is, it must be regarded, decided. And as yet these doubts have not so much, we believe, as arisen; or, if they have, they are not prevalent, and so do not affect our position.

We now proceed to consider whether the subjects at issue have minds of a character of that identity which would justify the comparison of the respective products of action. It might be urged that intellects which are so constituted as to be eminently adapted for acquiring knowledge, projecting inquiry, and defending truth, must necessarily be of that fundamental principle which is contradistinctive to the ordained constitution of woman's mind; that the innate disposition of her mentality being docile, and in its whole bearing not suited for acquisitiveness or solid masculine philosophical research, but for intelligent urbanity, subserviency, and rational unanimity; and hence that nature, intending her for a sphere diametrically opposite to that of man, formed her with a mind adapted for the carrying out of that design; and that this, therefore, has led to the destruction of any characteristic common to men. But that this is the case remains to be shown. When the objection which we suppose to be urged has been proved to be validly drawn, the case we advocate will, at the same time, be proved nugatory. But there is no necessary connexion between the powers which act in the gaining of knowledge and the maintaining of truth, and those which act in producing the various mental evolutions indispensable to insidiousness and opprobrious deportment. We may not so far

deviate from the track of our prescribed course, as to enter into a cogent discussion on the metaphysics of this contra-abduction. Let it be sufficient if examples be produced, and that it be shown that no others in juxtaposition to them can be so adduced as to overturn their coercion. For instance, let that learned heroine of history, Lady Jane Grey, be considered. Had not she every grace to which woman is by nature heir? And if old Ascham, speaking through Landor, may be credited, she was also extensively versed in all the literary lore then extant. One who at that age could say, "But tell me, would you command me no more to read Cicero, and Epictetus, and Plutarch? The others I do resign!" must have had a mind very highly cultivated. Other instances of the union in woman of deep learning and high amiability might be quoted, but space forbids. We adverted to these ancient examples in order to controvert the opinion that unusual learning and acute intrigue were in that age invariably twin. But referring to modern times. Here we are constantly borne out. On all sides we have fruits of the skilful use of woman's pen. Those of the "fair" whose mental power has raised them towering over their compeers, have graced their sex as much as their abilities have adorned themselves. The cases in which the motives that prompted the pen were deteriorating to the image which Eve saw reflected in the lake are very exceptional. Mrs. Fry did not more grace the lazaret-house than the many of her corivals have graced literature. The Hon. Mrs. Norton is, perhaps, an exception. "But what is one to the many?" And the mental elements that wrought her unenviable notoriety were set on fire by the collusions of puerile weakness; precisely as "Wakefield" sprang from poverty, Pope from deformity. It was not so much from the possession of power as from the obloquy of impotency.

Perhaps this principle is pressed as applicable to man in common. But it is not just. For we refer to power subservient to morbidity; and while admitting the presence of that power, as incidental to humanity, in woman, deny that an example of it, though exhibiting an unusually high order of a certain grade of mental superiority, is of avail against our assumptions respecting the abuse

of mental power when it is inordinately possessed by woman.

We should wonder at the fluency of an idiot, the strength of a maniac, the acute reasonings displayed in the uncontrolled harangues of a lunatic; but surely, being surprising, we should not deem them worthy of emulation and praise.

And though there are many cases in which fortitude, personal courage, readiness for adaption to adverse circumstances, energy, promptitude, and physical skill and force, have, in a remarkable degree, been exemplified in woman, yet we may not argue that woman is the fit subject for occupying those posts in which these excellences may be developed by constant use. No! Grace Darcys, Catherine of Russia, and other heroines have honoured the world; but we must not, therefore, presume that their sex are to fill the offices in which they shone.

To what conclusion, then, do we now inevitably arrive? Obviously, if we have shown that which we intended, to this,—Woman is mentally inferior to man. The circumstances which accompanied the coming of Eve into the world appear to subtend this view. We do not refer to Milton's portraiture of that event. He had, prior to his entrance on "Paradise," passed through "experiences," which peculiarly unfitted him for correctly seeing the connexion between that event and subsequent history.

Little reliance, then, may be placed in the views which ancient poets convey of the relationships, mental or circumstantial, between woman and man. Correct judgment can be attained only by personal observation. The fruits of the mind, as the fruits of all things else, are the only means of rational decision respecting the source of those fruits. SENOJ.

Politics.

OUGHT MONEY TO BE INTRINSIC OR SYMBOLICAL?

INTRINSIC.—II.

THE currency involves principles very little understood by the masses of mankind, and yet it is a subject which is every day becoming greater importance; we therefore, with great satisfaction, hail its introduction into the pages of the *Controversialist*.

It seems to be universally acknowledged that there should be a circulating medium—a standard of exchange—of some kind or other: and the necessity of it is so evident, that it needs no arguments to demonstrate it. The most savage tribes estimate the value of commodities by reference to some particular object, such as the skins of beasts, shells, powder, shot, various kinds of cattle, &c. But wherever they have been obtainable, the metals, more especially gold and silver, have been preferred; and this for several reasons,—their scarcity, their durability, the difficulty of procuring and refining them; and these, with the fact of their being articles suitable for use and ornament, and therefore of intrinsic value,

have marked them as the most suitable articles for a circulating medium. Hence we find all the more civilized nations have made these two articles the chief medium of exchange.

And now comes the question—Should this medium of exchange possess an intrinsic or symbolical value? By the former is meant something which shall possess a value in itself, apart from the fact of its being the circulating medium, by its being of certain use in the economy of life or labour. By the latter is meant something which shall possess only a fictitious value; something which is so common, or of so little use, as to be, in itself, valueless; or which, if it does possess a certain marketable value, yet from its having a peculiar and distinctive mark added to it (that is, being made the circulating medium), shall have a value added to it far beyond what the expense and labour of adding that mark shall warrant. A sovereign may be taken as a fair example of

the one; for though you may destroy it as a current coin of the realm, by beating it out of its shape, or melting it, its value is thereby little, if at all, decreased. A check will serve as an example of the other, which, being worth many pounds, will, merely by the erasure of the name of the drawer, become valueless.

Now, the circulating medium of this and every other European country essentially possesses an intrinsic value. For, though there are some pieces of paper called notes, not possessing an intrinsic value of one farthing, which will, nevertheless, pass current for many pounds, yet they do so only because they bear a promise that the holder shall be entitled to that number of pounds in gold and silver; and which, on presentation to the drawer he can obtain. Now this being the case, it is evident, that as these notes are only of value because specie can be obtained for them, specie is the true circulating medium.

Gold and silver are recognised as possessing nearly the same marketable value all over the world; their relative value (that of gold to silver being in the proportion of about 15½ to 1) being likewise nearly the same in every country.

Now, the exchangeable value of all commodities depends—1st, upon the scarcity of the material of which they are made; 2ndly, upon the amount of labour expended upon them; and 3rdly, upon the quantity supplied as compared with the quantity demanded. These are as much qualifications of the value of gold and silver as of any other commodities. This being the case, and these two articles being recognised as the medium of exchange—money—by all civilized nations, they cannot as such be scarce, so that there shall be a deficiency in the value of the circulation of nations. As the value of gold and silver in a great measure depends upon their scarcity, the smaller the quantity supplied, the greater will be the value of that which is supplied. So if the supply be 20,000,000 lb., instead of 10,000,000 lb., the value of the circulation will not be materially increased. This would not be equally true of bullion (that is, gold and silver unwrought, not coined or made the circulating medium); for there being an increased supply, and consequently a decrease

in the value, it would be more generally used, and thus the increased demand would in part counteract the effect of the increased supply.

That the value of gold and silver in a great measure depends upon the quantity supplied, we shall soon have—if we have not had—proof. It may be remembered that the Chancellor of the Exchequer (Disraeli), in lately addressing his constituents, attributed the rise in the price of corn, not to any increase in the value of the article, but to a decrease in the value of gold, owing to the increased quantity supplied from the fields of California and Australia. Whether this be so or not, it is not our province here to inquire: but that gold, from the cause above alluded to, *will* be depreciated in value, and that to a very considerable extent, there cannot be the slightest doubt.

But to return. If the supply of gold be doubled, there will not be really a greater value of money in circulation, if, from that fact, the price of commodities rise in the same proportion. Money is only of value to us as it enables us to purchase those articles of which we stand in need; and unless an increased supply of money will enable us to obtain an increased quantity of commodities, what does it profit us to possess it!

We have been thus particular in pointing out that there can be no real scarcity of money, because we believe that it is an argument against a circulating medium of an intrinsic value, that there is not enough of it to allow of industry and energy being exerted to the utmost; that, in fact, mankind cannot labour so much or so advantageously as they would do, if *greater quantities* of money were in circulation. We have endeavoured to show that there is a fallacy in this argument, and that there can be no real scarcity of money. At the same time, there may be and frequently is a scarcity of money *in one country as compared with another*; or amongst one class as compared with another; or with one individual as compared with another. But this is so, not because there is any real scarcity of money in the world, but because the poor country, class, or individual, has not the means of procuring it; that is, they cannot produce articles for which there is a demand so cheap as others;

or they cannot dispose of those articles which they have produced, owing to the markets being glutted: there is either a deficient demand for goods on hand, or there is a want of means, or of industry, to obtain the necessary capital to produce commodities. A nation may stand in this disadvantageous position with regard to another, owing to its geographical position, the nature of its soil, a radical defect in its laws, the slothfulness of its population, &c.; or from some more temporary cause, such as the failure of a crop from which one of its most staple articles of commerce was produced. Under this latter circumstance, that nation would still be under the necessity of applying to foreign nations for those articles for which it was dependent upon them, whilst it would be without that article which it had previously been in the habit of exporting; and thus it would become drained of its gold, as it keeps paying away money and receiving none; and a scarcity of money will be the inevitable consequence. In such a case, the supply not being equal to the demand, its value will rise, whereupon it will leave those places where it is plentiful, and hence of less value, and come to that place where more can be obtained for it; and thus the equilibrium will be restored.

From what has been already said, it will be perceived that the wealth of a nation depends upon the amount of commodities which, from its industry, position, soil, &c., it is able to produce: and that amount is represented by the money which it possesses. From this it follows that a nation or individual cannot possess money—money of an intrinsic value—except as the price of commodities produced and sold.

Such then, briefly, are the leading principles which follow a currency of an intrinsic value. Wherein consists the evil, we are wholly at a loss to imagine. We have shown that a scarcity of money is only a relative term; that there must always be a deficiency of money of an intrinsic value, not necessarily in circulation, but somewhere. We have shown that no nation, class, or individual, can possess money, who cannot produce something—something which is wanted—in exchange for it. We ask, if it be not just and natural that it should be so: if there should not be a relative scarcity of money where there is a relative scarcity

of commodities produced? We hold that it is. Where then, we again ask, are the evils which attend a currency of an intrinsic value?

Let us now turn to the consideration of money of a symbolical value.

A medium of exchange of a purely and wholly symbolical value is something quite untried: the effect of its introduction must, therefore, necessarily be to a certain extent speculative. That its introduction must be universal is evident; otherwise no commerce, except in the way of barter, could be carried on between nations differing in so important a particular as the mode of payment by a currency of an intrinsic value and one of a symbolical value. For no country where the currency was of the former description, would import articles into a country which could only pay for them in a currency of the latter description.

We will suppose, then, money possessing only a symbolical value to be universally adopted. We will further suppose paper to be the article selected, as that possesses many of the essential qualities of a circulating medium. It is easy of production, of but little intrinsic value, light and portable, and capable of being made to occupy little space. It is moreover capable of being made to represent any value, and if destroyed its place is easily and cheaply supplied. All these qualities point it out as the article most likely to be adopted in case such a change in the currency as that above supposed were actually to take place. Having supposed thus much, we really are at a loss what to suppose next, so as to make the supposition, if carried into practice, workable. But as this paper money is symbolical, there must be something of which it is the symbol. What is it to be? Wheat, land, timber, flour, sheep, horses, bullocks; what? We really are at a loss to say. All these articles are continually changing their relative value. To-day wheat is plentiful and cheap: a year hence it is scarce and dear. To-day my paper money, representing so many loads of wheat, will buy me one house: a year hence that same money, representing the same quantity of wheat, will buy me two of the same description. To-day I am a poor man: a year hence, possessing the same amount of paper money, comparatively speaking, a rich one. Evi-

dently, then, wheat is too changeable in its value to serve as the article, from the representation of a certain amount of which the paper currency shall derive its value. Nor, for the same reason, will timber or cattle do. *Land* is an article which changes its value less frequently, and to a less extent; for the supply being always the same, one of the chief essentials to a changeable value is wanting. Will that serve? Let us see. We hold in our hand a paper note representing the value of an acre of land. Some land will yield forty bushels of wheat per acre; other lands twenty only; and a third acre but ten. That note will represent either a value of forty, twenty, or ten; whichever you please. The supply of land in America being greater than the demand, whilst in England the contrary is the case, that same note may be worth ten, twenty, or even one hundred times more in England than in America. Again, one acre of land is situated in a town, and being suitable for building purposes, is worth ten times as much as an acre of plough land. The various portions of the soil, then, differ too much in their relative value to serve as the commodity which this paper money is to symbolize. Bullion, will that serve? What! Gold and silver still to be the standard of exchange! What does it profit you to do away with gold and silver as the real circulating medium, if that which takes its place is only of value as it represents a certain amount of the same article, only in its unwrought state? It may be answered (and we think it is on this supposed rock that our opponents will build the structure of their argument), that the government of a nation may issue these notes representing a value much greater than it really possesses in bullion; and thus the amount of the currency will be much greater than it is at present; and mankind will be benefited by money being more plentiful. To a certain extent we are aware this might be done. In fact, it is now done to a certain extent, in this and most other European countries. For example, both the Bank of England and private banks issue notes representing a much greater value—four or five times greater—than they possess in gold and silver. Nevertheless, it still holds true that these notes are only of value as specie can be obtained for them; and it is only by a

most admirable system of management that the issuers are enabled to meet the demand. The fact is, four or five different notes are cashed by the same specie, which is managed to be obtained faster than the notes are presented for payment. But it is only *credit* which enables them to do this; for as the credit of the bank decreases, so will the value of its notes. The same thing is true of a nation. Beyond a certain extent it could not issue paper money representing a greater value than it possessed in bullion; for the more it issued the less would be its value; and in time the country's credit would be gone, and with it the value of its paper money. We ask, then, where would be the profit of abolishing gold and silver as a medium of exchange, if that which takes its place is only of value as it represents it? Besides, if such were done, would they still possess the same relative value all over the world? Would they not be of greater value in those countries where they were most used in manufactures? Nor would those nations which did not make the same use of them supply the demand; as, in return, they would only receive that which represented the article, for the article itself.

We cannot conceive, then, what should be the article of which this paper money is to be the symbol. There must be *something*, which it shall symbolize; otherwise, if it were possible to confine each nation in the amount it issued (and this you must do, otherwise, if each nation might issue as much as it pleased, it would become worthless, owing to the easiness of obtaining it), a poor nation, that is, a nation not capable, or wanting the industry, to produce its share of commodities, might issue paper money to a greater or as great a value, as one that both could and did produce its share, or even more than its share, of commodities: that is, the *really* less wealthy nation would have a greater *fictitious* wealth, which at the same time passed as wealth, than its really more wealthy neighbour. This certainly appears to be unnatural, and, we cannot but think, unjust also.

Not being able to see any evil in the present system of currency, it having besides the advantage of being the only one that has been tried, and the additional one of being practised by every nation that has

existed; whilst, on the other hand, a currency possessing only a symbolical value is as yet untried, and moreover, in our opinion,

is impracticable; we unhesitatingly answer, that money should possess an intrinsic value.
F.F.

SYMBOLICAL.—II.

As I am fully alive to the truth and importance of the cause of representative money, or paper money, I append my name, as a pledge to the readers of this most improving and impartial periodical, that I am not ashamed of the doctrines, but esteem it an honour to be an humble instrument in laying them before your readers. I sincerely believe that gold money has been an unmitigated curse to the people of the earth; that it has been adopted owing to the gross material state into which man has fallen; and that it is typified in the worship of mammon denounced in the scriptures. Gold money has scarcely any advantage over barter; for if it obviates the difficulties of barter, it widely departs from the justice of that primitive mode of exchange. The problem which money reformers have to solve is, "To invent a paper or representative money, which shall combine the justice of barter with the convenience of money."

In advocating paper money, I labour under great disadvantages. It has been often resorted to—but not on principle—as a last resource in desperate national crises. It has been ruthlessly issued without any basis of labour or production behind it. R. L. G. will find no more determined opponent than myself to an unlimited issue of paper. I am no advocate for any needy adventurer to take a piece of paper, sign it, and pass it off as money, any more than I would be an advocate for the issue of a bill of lading which had no cargo behind it; or of a warehouse warrant with no goods in the warehouse; or of a bill of exchange and no effects. It is against gold I am a determined enemy. But if R. L. G. would take one step in advance in the argument, and, allowing that no single commodity can represent the value of all other commodities, will discuss with me how can paper money be issued, that it shall never be in excess or in deficiency as compared with population and consequent production, I should with pleasure go into that important inquiry.

R. L. G. refers to the continental money of the American War of Independence.

Why, what would he have? They had no gold nor silver. They were obliged to issue paper, and that paper won their independence. Why find fault with an instrument that effected its purpose? Then the French assignats! that staple argument with bullionists. Why, the French assignats saved the republic. This powerful instrument precipitated armies on every frontier of France. It is a fact—by Carlyle admitted in his French Revolution—that though the excesses of that convulsion have filled posterity with horror, yet that the condition of the people was never better. But let R. L. G. mark this, that I still maintain that, powerful as this instrument has been for national purposes, it has been empirically issued. R. L. G. must know that the assignats were issued at first on a sound basis, on the national domains, and then performed all the functions of a legitimate money; but unscrupulous men afterwards issued them ruthlessly and without any base of labour or land, and then depreciation—excessive depreciation—ensued.

R. L. G. alludes to Russian paper money. The Russians were wise enough to invent an internal money with which to transact internal business, and so send all their gold to this country, where they got four pounds an ounce for it. I only wish the Californians and Australians were equally wise; it might open our eyes to the folly and insanity of our gold worship.

"The true theory of currency can only be that which practice has taught us." Was ever such a doctrine enunciated! The true theory of roads can only be that which practice has taught us;—have nothing to do with railways. The true theory of transmission of thought can only be that which practice has taught us;—do not theorize about electric telegraphs. Sir Robert Peel's law, that the immense transactions of this country shall, although amounting to thousands of millions, be ultimately resolvable into some fifty millions of gold, is what practice teaches, the cause and source of the incalculable ruin which fell on our trading

interests in October, 1847;—do not let the experience of that fatal year induce you, says R. L. G., to see whether money may not be based on some philosophical axioms. Practice! Practice teaches us, that so unbearable was Peel's bill, which is a legitimate bullionist bill, carried out to its legitimate consequences, that it was suspended and declared unworkable.

It seems I have Montesquieu and Smith, Peel and Horner, quoted as authorities. I could quote Sir Robert Peel's father as a set-off to the son, and I will venture to put Mr. Matthias Attwood against Mr. Horner. Adam Smith most unaccountably slurred over the question of money and its principles; and against Montesquieu I put our own Bishop Berkeley, who asks some most pertinent questions, namely, "Whether money is to be considered as having an intrinsic value, or as being a commodity, a standard, or a pledge, as is variously suggested by writers;" and "Whether the true idea of money as such be not altogether as a ticket or counter?" This great thinker saw the importance of the money question, for he asks again, "Whether the use and nature of money, which all men so eagerly pursue, be yet sufficiently understood and considered by all?" He puts another question, which R. L. G. may answer at his leisure, "Whether paper doth not, by its stamp and signature, acquire a local value, and become as precious and as scarce as gold, and whether it be not much fitter to circulate large sums, and, therefore, preferable to gold?"

Labour is the source of all wealth, and money should be only the certificate or memorandum of wealth. Now, I ask, is not an insane demand for gold, as a money, ruining Australia? The whole population have turned out, left their skilful employments, ceased to cultivate the land, ceased to build their houses, ceased to follow their useful occupation, and converted themselves, under the premium of one fixed price—four pounds an ounce—into so many grubbers into holes and cinder-shifters. I may be mistaken, but I say, that if gold was deprived of its money function, it would only be worth, at this moment, for its intrinsic qualities so useful to art, about one pound an ounce, owing to its miraculous discovery in such large quantities.

R. L. G. says, "As amicable foreign rela-

tions wane, the value of symbolical money must wane also." Not at all. The object of an internal currency is for internal purposes, and its great beauty is, that the action of foreign exchanges never withdraws it. R. L. G. must know that foreigners do not take our sovereigns—*quasi* sovereigns—but a certain weight of a valuable article of commerce; and paper money would allow every ounce of gold to leave the country without the slightest inconvenience, for the paper would supply its place. R. L. G. must be informed, moreover, that we have had an internal money, not made of paper, but of wood. He knows, I am sure, all about exchequer tallies—it would be impertinence for me to teach him what every tyro knows, that the exchequer tally was wooden money, and worked in the following manner:—

The king wanted, say, a war horse, and taking one, paid the owner with an exchequer tally. The owner of the horse next day bought sheep from his neighbour, and paid him with the piece of wood with certain conventional notches on it. The king, demanding taxes from the owner of the sheep, received the piece of wood, which was cancelled by the exchequer. So that practice is not altogether on R. L. G.'s side.

I do not want to quote authorities, for paper money is a new question, and has never, I admit, been issued on scientific principles; but I can, if space allow, quote General Harrison, Dr. Franklin, Sir Robert Peel the elder, Sir Walter Scott, under his signature, "Malachi Malagrowther," and Bishop Berkeley. I could show that America, by General Jackson's idolatry of gold, was convulsed to her centre. I could show that it was paper money that enabled Pitt to elevate the country at home, and to conquer Bonaparte. And I could show that if we had paper money issued *bond fide* on labour and products, that the illimitable powers of this country to produce might then have fair play—every man at work, every steam-engine in full operation; that poor rates might be annihilated; and that if any great work could not be prosecuted, it would never be for want of money, but because every man was so deeply engaged, that there was no spare labour free and at liberty to prosecute it.

JAMES HARVEY.

The Societies' Section.

STUDIES FOR LAW STUDENTS.

As this magazine includes in the ranks of its readers a large number of young men who intend to follow the profession of the LAW, either as solicitors or barristers; and as frequent inquiries are addressed to the Editors for information on various topics relating to the acquisition of such *general knowledge*, by students, as may be found of service to them, either in preparing for or following their profession; it is proposed from time to time, as occasion may require, to devote some space to their especial service.

We know that by some persons it is held to be unnecessary, and even dangerous, for a student to direct his attention to branches of knowledge other than those immediately appertaining to his intended profession. But it is to this principle we attribute the not unfrequent occurrence of learned men (so-called) exposing themselves to ridicule the moment they step from the path of their own immediate experience. As the Greek tragedian beautifully said, that being *human*, he considered nothing alien to him which related to humanity, so we think that the student at law should deem no knowledge unimportant to him, which will be likely, in any way, to aid him in his professional career. And where, we ask, is there a profession in which such a diversity of knowledge is essential to success as in the law? One day the solicitor or barrister may be engaged in protecting his client from the piracy of some mechanical invention or scientific discovery; the next, prosecuting upon a breach of the law of copyright; and a third, examining the accounts of a bankrupt. There is, in fact, no assigned limits to the diversity of knowledge required of him; and, as a general rule, he will succeed best whose mind has been best prepared to grapple with these changes.

It may not be necessary to adopt any particular rules for the acquisition of this secondary or supplemental knowledge. The course adopted will depend upon the individual abilities and opportunities of students, as well also as upon their tastes and inclinations, and even upon the particular branch of the profession they intend to follow. For these reasons we shall adopt no given order in our intended remarks and recommendations, but rather take them as they suggest themselves to us, or as we have reduced them to practice.

Assuming each student to have finished his SCHOOL EDUCATION, either as a prelude to his next studies, or concurrently with them, let him acquire a perfect and ready knowledge of some good system of *short-hand*. To acquire this knowledge, so as to be really useful, will occupy some time, and be attended with some little trouble. But that time and trouble will be well repaid. The student unacquainted with this art can form no conception of its many advantages. Throughout all his after studies it will be one of his best, because most serviceable, friends. For reports, for marginal notes, for extracts from works read, for copying precedents, and for correspondence with other students, nothing can exceed its advantages. It stimulates to industry, and materially lessens the labour attending it. After obtaining an acquaintance with the most popular systems in practice, we can recommend *Pitman's Phonographic Short-Hand* as the best for all the purposes enumerated.

The next thing is for the student to provide himself with an *Index Rerum* and a *Common-place Book*. Of the former, Todd's (price 3s. 6d.) is the best. The latter may be made to the student's own taste. Blue-lined paper with a margin forms the most convenient sort we have seen. The purpose of the *Index Rerum* is, as its name implies, to make an index of the facts and information acquired in the process of reading and study. As the book we have recommended contains full instructions for its use, we need only remark, that as we all know how much sooner knowledge is *lost* than gained, any plan which will enable us to retain it at our fingers' ends, ready for any emergency, must be exceedingly valuable. Some students have found that with a carefully kept *Index Rerum* they had but little need for a *Common-place Book* in addition. This will depend pretty much upon the student's own taste. Whilst reading, we often find passages which bear with peculiar force upon points to us possessing more than ordinary interest. The object of our *Common-place Book* is to get into one collected form, ready for easy reference, the opinions of different writers and speakers upon these particular points. Short-hand makes the process one of little trouble, and that little is amply repaid by the result. As the student advances, a *Precedent Book* will be required—but of this more anon.

Next, the student should be thinking about the various means of acquiring a proficiency in the art of *public speaking*. Too much importance can hardly be attached to this acquisition. If the student intends to qualify for the bar, his road to eminence, as it has been said, "lies through his tongue;" and even as a solicitor, he will find frequent occasion to speak in public, and his clients will soon appreciate any excellence he may possess in this particular.

There are various methods by which the student may attain proficiency in this art. One of the first requisites is *knowledge*, for unless a man possesses a clear knowledge of the matter on which he has to speak, and even of its bearings, he will find great difficulty in delivering himself eloquently. Next, he should make himself acquainted with the best models of eloquence, not for the purpose of becoming a mere reciter, or a servile copyist of the style or language of another; but that by seeing the excellences of others, he may be encouraged and aided in making himself excellent. Then he must **PRACTICE**. A man may be acquainted with *all* the best models—may be able to sit in critical judgment upon them—and may also have a mind well stored with information; but unless he has given some time and pains to practice, he will most likely make a miserable failure as an orator. In public speaking there is required certain gestures—"suited the action to the word"—which can only be acquired by practice. But it is not our purpose to give instruction in oratory; we will therefore only refer our readers to the "*Guide to Oratory*" (Mitchell, London), and proceed.

The student will naturally ask *where* he is to practice oratory? He cannot commence before public assemblies, and does not care to practice in his own chambers. In fact, in one case the excitement would be *too great*, in the other *too little*. What, then, is to be done? In almost every town there is, or should be, a *Debating Club* or a *Discussion Class*, where questions of present or permanent interest are opened and discussed on the plan adopted in this magazine. At such meetings the student has the advantage of the stimulus which the presence of a mixed audience of friends and strangers generally imparts, and which will prompt him to endeavour to excel. In the biographies of nearly

the great men of modern times, we have observed that they at some period of their life had joined a debating club, and many of our living orators have derived great assistance from this source. Let the student, then, enrol himself a member of one of these clubs; and let him do so with a steady determination to gain his end, and he will succeed. If there be no such class, let him forthwith call the other students of his town together and form one; but, if possible, let it be in connexion with some literary or scientific society, and not at an inn or tavern.

Besides the direct advantage of attaining fluency and readiness in public speaking, debating societies offer additional and peculiar advantages to law students. In them they learn that every question has two sides: and hence they also learn not to place implicit reliance upon either until the other has been well discussed and considered. They moreover become accustomed to sift the arguments of the various speakers, and by degrees are enabled to judge of those which are based upon sophistry, or seek to promulgate fallacious conclusions, and can treat them for what they are worth. By these means they are gradually preparing themselves for the proper discharge of those duties which will appertain to their intended profession: this is a point never to be lost sight of. Perhaps we cannot better clench our argument for the acquisition of general knowledge by the law student, than by citing the following extract from BLAIR'S Essays:—"Besides the knowledge that properly belongs to that profession to which he addicts himself, a public speaker, *if ever he expects to be eminent*, must make himself acquainted, as far as his necessary occupations allow, with the general circles of polite literature. The study of poetry may be useful to him on many occasions, for embellishing his style, for suggesting lively images, or agreeable allusions. The study of history may be still more useful to him; as the knowledge of facts, of eminent characters, and of the course of human affairs, finds place on many occasions. *There are few great occasions for public speaking in which one will not derive assistance from cultivated taste and extensive knowledge.* They will often yield him materials for proper ornament; sometimes for argument and real use. *A deficiency of knowledge, even in subjects that belong not directly to his own profession, will expose him to many disadvantages, and give better qualified rivals superiority over him.*"

C. W., Jun.

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Milwaukie Mechanics' Institution.—On Friday evening, the 19th March, upwards of 200 of the members and friends of the above institution held a social festival in the Congregational Hall. The president, Mr. H. Ross, occupied the chair, and delivered an excellent address upon "The Advantages of Knowledge." The following members addressed the meeting during the evening: Mr. R. Crawford, on "The Social Condition of the Working Classes in the Olden Time;" Mr. J. Hinkley, on "Some of the Causes of Ignorance;" Mr. T. Douglas, on "The Process of Moral Regeneration in the Mind." "National Education and its probable Results upon Mechanics' Institutions," was popularly treated of by H. Carmichael; who, after briefly alluding to the necessity for a grand and comprehensive system of educa-

tion, and the duty of government in reference thereto, proceeded to prove that the cry which is being raised against a national system of secular education, as being "godless" and "irreligious," is founded on the delusion, that by making religious instruction imperative—by making it a matter of statutory business—by obliging the schoolmaster to teach it—security is thereby furnished for inculcating respect, and inducing love for religion. He strongly urged the importance of the working classes uniting in support of a truly national system of secular education (the only common ground upon which all can meet), and thereby secure to every child within these realms what he conceived to be their inalienable right, a good and useful education. He then went on to delineate the beneficial results which would flow

from Mechanics' Institutions, could they be rendered national, so as to make them a part of the popular instruction, and drew a bright and hopeful picture of the position such institutions would occupy under a national system. He concluded by maintaining that a liberal and judicious system of national education would secure for these institutions an amount of success commensurate with their design and universal importance. A musical party was in attendance, and contributed much to enliven the proceedings, by giving in good style several select glees, duets, and solos. Refreshments in pastry and fruit were served to the company during the evening, and the meeting passed off with the greatest *eclat*; forming a most appropriate finale to the present session, which has been one of the most successful in the annals of the institution; thirteen public lectures having been delivered upon highly useful and interesting subjects, many of them by gentlemen of first-rate talent and ability. Several liberal donations have been received from the gentlemen in the neighbourhood, thereby enabling the directors to develop more fully the advantages of the institution, by adding a fresh supply of those solid fruits of mental toil which go to make up our national literature; and placing them within the reach of those to whom, but for such institutions, they would have remained inaccessible.

H. C., Sec.

Shirley, near Southampton.—The second anniversary of the Shirley Mutual Improvement Society was celebrated March 24th, 1852, on which occasion about eighty friends sat down to tea. A meeting was afterwards held for the purpose of furthering the objects of the society, when the Mayor of Southampton, R. Andrews, Esq., presided. After an opening address by the chairman, the secretary read a paper illustrating the objects and principles of the society, and reporting the operations of the institution for the past year; from which it appeared that 29 lectures had been delivered, and 13 discussions held, and 33 members received into the society. Addresses were delivered by the Revs. Messrs. Hugh, Hutton, Alexander, M'Laren, and T. Falvey, Esq. The enjoyment of the evening was greatly enhanced by the performances of a glee party, and by several recitations from members and others. At the close the whole company joined in singing the national anthem, and separated highly delighted with the evening's entertainment.

South Wales.—Merthyr-Tydvil Young Men's Mutual Improvement Society.—This society was established in April, 1851, in the following manner:—Some praiseworthy young men, anxious for the welfare of others, caused printed bills to be placarded over the town, inviting the public, especially young men of all grades, to a public preliminary meeting for the purpose of forming a society for mutual improvement. There was a very good attendance at the meeting, and several gentlemen delivered able addresses, showing the benefits that would be derived from such a society. At the close of the meeting a committee of twenty was chosen, for the purpose of drawing up rules and regulations for the society, and the names and subscriptions of parties wishing to become members were received. The principal rules and regulations drawn up by the committee and adopted by the members were

as follow:—That the society should be called, "The Merthyr Young Men's Mutual Improvement Society;" that each member should subscribe one shilling per quarter, to be paid in advance; that none but members should be allowed to attend the meetings; that the affairs of the society should be managed by a president, vice-president, secretary, and committee of twelve; that the said officers should be elected on the last evening in every quarter by a majority of the members—the mode of election being by ballot; that meetings should be held twice in every week, viz., on Tuesday evening, for the purpose of debating, or of hearing an essay on some interesting subject by one of the members; and on Thursday evening, for the purpose of holding classes for instruction in grammar, arithmetic, geography, &c.

The only alterations that have been made in these rules are, that each member is now allowed to introduce one friend or acquaintance into the society's room once during each quarter; and that parties wishing to join must request members to propose them, and then be admitted by a general ballot.

On the first evening of every quarter we request some gentleman of known abilities to deliver a public lecture, which is duly announced by printed bills. We have also printed cards, for the pocket, containing the list of subjects for each quarter. We now number about thirty members. President, Rev. J. C. Campbell, M.A.; vice-president, Mr. William M'William; secretary, Mr. William M. Fuller.

Some of the members, including myself, take in the *British Controversialist*, and regard it as a publication of inestimable value, that cannot be too widely circulated or highly prized.

I have been thus explicit, thinking that what is here stated may be of service to similar societies.

D. J.

Greenwich Literary Institution.—The second quarterly meeting of the members of the Elocution Class was held in the great hall of this institution, on Wednesday the 24th of March, 1852. Newton Crossland, Esq., of Hyde Vale, Blackheath, presided on the occasion.

The chairman commenced the business of the evening with a short but appropriate address. The first part of the entertainment opened with Scene 3, Act I., of Shakespeare's *Henry IV.* The King was personated by Mr. James; Hotspur by Mr. D. P. Waters, who gave the part with much effect, and succeeded in calling forth a general expression of applause from the audience. Northumberland and Worcester were represented by Messrs. Jackson and B. W. Smith.

A scene from *Charles XII.* next followed, in which Mr. Talbot elicited repeated expressions of applause by the irresistibly comic manner in which he gave Peter. Then the *petite farce* of *Pillicoddy* succeeded, which afforded much merriment. A portion of Bourcicault's *farce*, *Up, and Tyrrell's* comic dialogue, *In Want of a Situation*, were given, in which Messrs. Waters, Jackson, and B. W. Smith, afforded much amusement. In addition to the above, there were some good pieces of prose and verse, from our popular authors, recited with various degrees of skill by other members of the class in the course of the evening.

The audience, consisting of between 700 and

40 persons, seemed much pleased with the evening's entertainment.

It is hoped that these quarterly elocutionary entertainments will be carried on with as much

spirit and energy as hitherto, and thus afford a treat to the friends of mental progress and improvement in Greenwich and its neighbourhood.
J. W. T.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

101. I have got an idea lately that I can pursue two studies at the same time; my plan—upon which I desire the opinion of some one more experienced than myself—may be gathered from the following:—I am sufficiently acquainted with French to be able, with little difficulty, to read an author in that language, but have by no means the familiarity with it which I am anxious to attain; I am also at present about to turn my attention to comparative physiology and history, and have thought if I could get French works on these subjects, by their perusal I might increase my knowledge of the language, while I was also gaining useful knowledge of another kind; should this plan be thought capable of being advantageously carried out, I should esteem it a great favour if some one would inform me of good French publications under those heads, with respective prices, and name of London book-seller from whom they may be obtained.

AVARUS.

102. The effects of the east wind are felt and seen by every one, and there are few who cannot testify to their prejudicial influence. And yet what is the cause? Their coming from across the continent of Europe cannot be a reason, as travellers in other lands speak of the discomfort arising from easterly winds. The locusts covered the land of Egypt, drawn thither by this wind, and indeed all its effects are rather of a disastrous character. Can it be, as some have attested, that in the earth's revolution upon its axis it rushes into this wind? I shall look anxiously for a well-grounded opinion.—CONSTANTIA.

103. As I am very desirous of acquiring a thorough knowledge of the Greek and Latin languages, but have no friend near to direct me, I would feel thankful to any of your learned correspondents for a few directions as to the best mode for pursuing my studies, together with a list of the best works in connexion with the above languages. Hoping that you will deem my thirst for knowledge a sufficient apology for thus troubling you, I remain, &c.—L. G.

104. I shall feel obliged if any of the studious and intelligent readers of the *British Controversialist* will furnish me with their opinions as to the utility of Common-place Books. Are they really of service to the student, and why? Do they fix the subject more firmly in the memory? Are the subjects entered in a common-place reader of more reference than to a work itself? Is the system in general a sufficient compensation for the time and paper used in making such entries? And if this plan should be recommended by any, they will oblige by stating the system adopted by themselves in taking notes; whether it is best to form a sort of abstract or analysis of the work read, or to take a sentence here and there, as you may think such sentence would be of use? For the better illustration of this subject, I should

feel obliged if they would show me how, in reading the article on Rhetoric, in the last number, they would take full and copious notes of it; and also give me their general plans in reading any work on literature or science. I should like to have the opinions of those who are great readers and diligent students, and to have full directions and advice on the above points, as I think that the manner of reading is not of secondary importance to the matter. Indeed we may get more information by reading one book well, than twenty badly. I should also like to know the sort of books generally used, and whether one does for several subjects, or whether it is the best to have separate ones for each separate subject. I feel confident that the Editors, with their wonted kindness, will not begrudge the space necessary for such answers, as I think it is a subject which will be of importance to all who feel interested in the arduous task of self-cultivation, and particularly as no remarks on this head have as yet appeared in this excellent periodical. Answers to this will be thankfully read by—A STUDENT.

105. Would you or any of your correspondents be kind enough to inform me what might be the probable outlay for matriculation at the London University? also, what is the course of study? Any other information respecting it would oblige.

W. G. C.

ANSWERS TO QUESTIONS.

70. *Carthaginian Names*.—According to Salust, Adherbal and Mastanabal were Numidians. But it appears that Numidia (as well as Carthage) was colonized by the Phœnicians. It is therefore highly probable that the same language was spoken in Numidia as at Carthage—i.e., the Punic. Bochart and many others prove that the Punic was a language of the same origin as the Hebrew. (See Bochart de *Coloniis et Sermone Phœnicum*, lib. ii. cap. 1.) The etymology of the two names may consequently be sought from the Hebrew.

Adherbal appears to be formed of the two words *adhder*, i.e., great, magnificent, or mighty; and *Baal*, the name of an idol. Now, *Baal*, *Bal*, *Bel*, or *Belus* was the great God of the Carthaginians; the name, therefore, signifies the "*great Baal*."

Mastanabal. This word seems to be compounded of *Mathlana*, i.e., gift; and *Baal*; and therefore probably signifies, "*the gift of Baal*."

77. *Mind in its relation to Matter*.—We know of no single work which supplies the desired information. Indeed, a complete and comprehensive treatise on this subject is a desideratum in our literature. Man-science is yet in its infancy: so far, however, as we are acquainted with the writings most nearly allied in their topics with the wants of P. S., we think that the following works, read in the order given, would go pretty far towards settling the views of your correspondent, viz., Chambers's "*Information for the People*"—papers,

"Phrenology," and "The Human Mind"; Caldwell's "Thoughts on Physical Education"; Combe's "Constitution of Man," Combe's "System of Phrenology"; the three works by A. Combe, E. Johnson, and S. Smith, mentioned in the query of P. S.; Dr. John Gregory's "Comparative View of the State and Faculties of Man, with those of the Animal World"; Sweetser's "Mental Hygiene"; Rapport's "Du Physique et du Moral de l'Homme" (On the Relations of the Physical Organization of Man to his Moral Faculties), par Pierre Jean George Cabanis; Comte Destutt de Tracy's "Elements d'Ideologie"; the works of Gall, Spurzheim, Bronsais, and Azais (of their chief works we believe there are translations); Lawrence's "Comparative Anatomy," and "Lectures on Man"; J. Mill's "Analysis of the Phenomena of the Human Mind"; Locke's "Essays," book i.; Mill's "Logic," book vi.; Dr. G. Moore's "Use of the Body in Relation to the Mind," and "Power of the Soul over the Body"; Dr. Wigan's "Duality of the Mind"; Hartley's "Observations on Man"; Dr. A. Smee's "Process of Thought, adapted to Words;" and, amidst much absurdity, egotism, and equivocation, several items of information may be picked up from "*Nuces Philosophicæ*" (Philosophic Nuts), by the author of "Life, Health, and Disease." The two works by Upham and Sampson would decidedly be useful; and several other articles of interest connected with this subject may be found in the "Phrenological Journal," the "Zoist," the "Journal of Health," &c. We may be allowed to say, however, that so far as these works attempt to abnegate the existence of a mind differentiated from brutish (apparent) intelligence, we do not sympathize with them. That "the earthly house of our tabernacle" may be dissolved without necessarily implying our total dissolution, we most firmly believe, and though we must acknowledge that the union-bonds of soul and body are intimately interwoven, we are irresistibly compelled to believe in their complete, perfect, and entire differentiation. We are convinced, however, that an accurate knowledge of the structure, healthy action, diseased action, and the organic functions of the mere animal machine, would materially tend to the clearing away of the mists which overshadow metaphysical inquiries. Some of the arguments for the existence of mind may be thus briefly enumerated—1st. Essentially distinct qualities presuppose essentially distinct entities. 2nd. Were mind and matter the same, mind must necessarily be latent in matter until educated to manifest itself by being put in certain relations; all matter must therefore be permeated with mind,

"And the dull clod on which we tread
Be instinct with such soul as human kind."

3rd. The evidence of consciousness. 4th. Dreams and other sleep-facts, *e. g.*, the common occurrence

of one engaged in excogitation, in the evening retiring to rest unsuccessful, and waking with a full mental view of the topic, making it probable that the mind acts continually, although we only become conscious of the motion of thought in waking hours or in diseased states of the bodily organs occasioning dreams. 5th. Absence of mind. 6th. The alternations of healthy and unhealthy action of brain in the insane, producing the idea of the derangement of mind, while it is really no more an argument to that effect than difference of media is evidence of variation in the real and actual qualities of light. 7th. The mind remaining clear, calm, and self-possessed up to the very moment of death, &c. We hope these observations may not be considered out of place, as corrective of the general influence of some of the works above mentioned.—THE AUTHOR OF "THE ART OF REASONING."

90. *Chivalry, the Crusades, and our Colonies.*—We are unable to refer J. C. H. to any History specially devoted either to Chivalry or the Crusades. The best cyclopædias furnish a good deal of information on both these subjects. In Gibbon's "Decline and Fall of Rome" there will be found many allusions to Chivalry; and in Guizot's "History of Civilization in Europe" will be found a vast amount of valuable information on the Crusades, and the benefits resulting therefrom. A work entitled, "Chronicles of the Crusades," published by Bohn, London, gives a great deal of interesting information as to the Crusaders. Undoubtedly the best "History of the British Colonies," is that now publishing by Montgomery Martin; it is sold in eight divisions, at 7s. 6d. each, is got up in elegant style, and brings all its information down to the present time. In Porter's "Progress of the Nation" will be found much interesting and useful information regarding our colonies.—C. W., Jun.

98. *The Italian Language.*—Veneroni's "Italian Master" and "Exercises" are excellent works, and such as we can confidently recommend. But if our correspondent be well acquainted with grammar, and have the advantage of knowing French, we think he will find Ollendorff's "New Method" better adapted to give a thorough practical knowledge of the language without the aid of a teacher. If the latter work should be the one of his choice, we would recommend him to limit himself to one or two lessons a week, as the case may be, always taking care that the last be thoroughly appreciated and remembered before commencing the next. Soave's "Novelle Morale" is a suitable reading-book for the student, and will agreeably relieve the monotony of Ollendorff. As to the pronunciation in default of *viva voce* instruction, he may resort to a cheap work, called "Italian Without a Master," on the Robertsonian method.—S. M. F.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XVI.

1. Define a Hypothetical Syllogism, and point out the difference between a categorical and a hypothetical one, with examples.

2. Define and exemplify Direct and Indirect Hypotheticals.

3. What are Disjunctive Syllogisms? Give examples.

4. Define a Dilemma. Give examples, and

the difference between a Direct and an Indirect Dilemma.

5. What is an Enthymeme? What are the rules regarding Enthymemes? Give examples.

6. What is meant by the terms, Epichirema, Sorites, and Prosyllogism?—and give examples.

7. Define "Analogy." What are the laws and precautions necessary to be observed in reasoning by it?

8. Define Induction, and show the connexion between Inductive and Syllogistic reasoning.

9. To which of the classes of Informal Syllogisms do the following examples of Reasoning belong, viz.:—

"Government ought to educate the people, because by so doing she would increase knowledge, refine imagination, improve taste, culture the moral faculty, elevate the mind, and enable men to act their part in life in such a manner as to be at once respectable and useful to themselves and advantageous to the public."—*Newspaper paragraph*.

"The country of Greece presents a large, irregular peninsula, intersected by many chains of mountains, separating its different districts, and opposing natural impediments to general intercourse, and therefore to rapid civilization."—*Tytler's Elements of General History*, cap. vi. paragraph 1st.

"The solemn conflicts of reason with passion; the victories of moral and religious principle over urgent and almost irresistible solicitations to self-indulgence; the hardest sacrifices of duty—those of deep-seated affection and of the heart's fondest hopes; the consolations, hopes, joys, and peace of disappointed, persecuted, scorned, deserted virtue, these are of course unseen; so that the true greatness of human life is almost wholly out of sight."—*Channing on Self-Culture*.

"Men might be better if we better deemed Of them. The worst way to improve the world Is to condemn it. Men may overget Delusion; not despair."—*Festus*.

"If a state has fallen into the unfortunate system of paper money, and this sinks in comparison with silver; then should a juncture of favourable circumstances furnish the means of re-establishing a metallic currency, it is altogether absurd, nay, purely disastrous, to make the metal resume its place with its standard *unchanged*, and the sums in all contracts abide by their *nominal amount*, while it is impossible to keep up prices at the height where they stood at the time of the paper circulation."—*Niebuhr's Roman History*, vol. i. p. 455, edition 1831, quoted in "Letters on Monetary Science," by ALADDIN.

"In general, fertile and luxuriant countries seem peculiarly fitted to be the nursery of refinement: because leisure awakens curiosity, and curiosity leads to pursuits that fill up the vacancies in human life. Every new situation presents to man new objects of solicitude and care. The demands of animal nature no longer bounds his desires. The scene now opens to the intellectual eye. He marks the relations and dependencies of things, and learns to contemplate the world and himself."—*Dunbar's Essays on the History of Mankind*, vi.

"If generals are not disrespected although they are frequently vanquished, neither should sophists be so."—*Aristotle's Rhetoric*, book ix. cap. 23.

GRAMMAR CLASS.

Exercises in Grammar.—No. V.

1. Write out the following nouns, with their feminines, in a form like the one given, placing each class of words in its proper column. Deacon, nephew, hero, host, lad, heir, king, conductor, dog, earl, duke, hart, adulterer, monk, horse, lord, colt, peacock, beau, stag, wizard, bull, seamster, marquis, protector, emperor, man-servant, votary, tutor, actor, executor, caterer, administrator, arbiter, governor, director, patron, chanter, margrave, ram, ambassador, mayor.

NOUNS.

GENDER.

By different terminations.		By different correlative words.		By prefixing a word denoting the gender.

By the addition of "us."	And contraction when necessary.				
By the addition of "ix."	And contraction when necessary.				
By the addition of "ine."	And contraction when necessary.				

MATHEMATICAL CLASS.

SOLUTIONS.—IV.

Arithmetic and Algebra.

Question 13. The numerator and denominator of a fraction may be multiplied by any number

without altering its value; so, $\frac{1}{2}$ may be multiplied by the product of 3, 4, 5, 7, or 420; and $\frac{1}{3}$ by the product of 3, 4, 5, 7, or 280; and $\frac{1}{4}$ by the product of 2, 3, 5, 7, or 210; and $\frac{1}{5}$ by the product of 2, 3, 4, 7, or 168; and $\frac{1}{6}$ by the product of 2, 3, 4, 5,

or 120; then we have $\frac{420}{840} \frac{280}{840} \frac{210}{840} \frac{168}{840} \frac{120}{840}$
 the answer, which may be further reduced if
 divided by 2 = $\frac{210}{420} \frac{140}{420} \frac{105}{420} \frac{84}{420} \frac{60}{420}$.

VILLAGER.

Question 14. The content of the first wall = $700 \times 12 \times 2 = 16800$ cubic feet, and the labour required to build it = $30 \times 164 \times 12 = 59040$ hours.

The content of the other wall = $900 \times 8 \times 1\frac{1}{2} = 10800$ cubic feet.

Then $16800 : 10800 :: 59040 : 37954.285$ hours' labour required to build the second wall; and as each man engaged upon it works $70 \times 10 = 700$ hours, therefore $37954.285 \div 700 = 54.22 =$ the men required.

W. H. R.

Question 15. Let x be the discount required; then by the question $x = \frac{2.5}{100} (5740 - x) = \frac{5740 - x}{40}$
 or $41x = 5740 \therefore x = £140$.

J. K.

Question 16. $x + y = 20$ (1). $x^2 + y^2 = 232$ (2).

Squaring (1) we have $x^2 + 2xy + y^2 = 400$.

Subtracting (2) from (1)² $\therefore 2xy = 168$ (3).

Subtracting (3) from (2) we obtain $x^2 - 2xy + y^2 = 64$.

Extracting root, $x - y = +8$ (4).

By addition since $x + y = 20$ (1) $\therefore 2x = 20 + 8 = 28$ or 12 . $\therefore x = 14$ or 6 .

Subtracting (1) from (4). $\therefore y = 6$ or -14 .

DIDYMUS.

Geometry.

Question 7. Construct the equilateral triangle ABC about the given circle, and through the centre O of the circle draw CD perpendicular to AB , and from O draw OE perpendicular to CA . Then let $2x =$ side of Δ , and $a =$ radius of circle.

Then $\frac{2ax}{2} \times 3 = 3ax =$ area of triangle.

and $\frac{2x \cdot CD}{2} = x \cdot CD =$ area of triangle.

$\therefore 3ax = x \cdot CD$, or $CD = 3a$.

But $CE^2 = CO^2 - OE^2$
 $= (2a)^2 - a^2 = 3a^2$

$CE = a\sqrt{3}$.

$\therefore CA$ or $AB = 2a\sqrt{3}$
 $= 17 \times 1.7320508 = 29.448636$.

W. C. D.

Question 8. The isosceles triangle touches the two circles whose centres are O and P , in D and E . The three triangles ABC , ADO , and AEP , are similar, because they each contain a right angle, and have the angle at A common. Hence,

$$AP : PE :: AO : OD$$

$$AO : OD :: AC : BC.$$

Now, if we put y for the height, AB , of the isosceles triangle, and x for its base, the first proportion becomes

$$y - 26 : 6 :: y - 10 : 10$$

$$10y - 260 = 6y - 60$$

$$4y = 200. \therefore y = 50.$$

From the second proposition we obtain by substitution,

$$40 : 10 :: \text{Side } AC : \frac{x}{2} \therefore \text{Side } AC = 2x.$$

And by Euc. I. 47. $4x^2 = (50)^2 + \left(\frac{x}{2}\right)^2$

$$\frac{15}{4}x^2 = 2500 \therefore x^2 = \frac{10000}{15} = 666.6.$$

$$\therefore x = \sqrt{666.6} = 25.82 = \text{Base.}$$

$$\text{And } 2x = 51.64 = \text{Side.} \quad \text{Ans.}$$

C. D. S.

Question 9. Let $r =$ radius; then as a line drawn at right angles from the centre bisects the chord, we have

$$(r - 8)^2 + (245)^2 = r^2$$

$$r^2 - 16r + 64 + 60025 = r^2$$

$$16r = 60089$$

$$r = 3755.5625.$$

$\therefore \text{Area} = (3755.5625)^2 \times 3.1416 = 1410429.69140625$
 $\times 3.1416 = 44309910.83$ square links, or 443 acres, 0 r., 15.857 poles.

C. D. S.

Mechanics.

Question 7. We must first find solidity of the excavation—viz., $17^2 \times 7854 \times 40 = 9079.224$ cubic feet.

2nd. Weight of the material = $9079.224 \times 100 = 907922.4$ lb.

3rd. The mean height to which the whole must be raised = $\frac{40}{2} = 20$ feet.

\therefore Total units of work = $907922.4 \times 20 = 18158448$,

$$\text{or} = 17^2 \times 7854 \times 40 \times 100 \times 20 = 18158448.$$

Question 8. Here work to be done = 18158448 , and work done daily = $2600 \times 60 \times 8$.

$\therefore \text{Time} = \frac{18158448}{2600 \times 60 \times 8} = \frac{18158448}{1248000} = 14.558$ days = 14 days, 4 hours, 24 minutes.

J. E. H.

QUESTIONS FOR SOLUTION.—VI.

Arithmetic and Algebra.

21. A gentleman gave some poor people $\frac{1}{2}$ of the money which he had in his purse, and afterwards called at a tradesman's and gave him $\frac{1}{2}$ of the remainder, receiving in change 4s. 6d. On arriving at home he found that he had 15s. left. How much money had he when he left home?

22. A certain person bought a quantity of eggs at 8 for 6d., and as many more at 10 for 6d., and sold them all out at 9 for 6d., losing 1s. 3d. by the transaction. It is required to find the number of eggs.

23. Given $x + y = 18$, $x^2 + y^2 = 1674$, to find x and y .

Geometry.

11. The proportion of land and water upon the surface of the earth is as 266 to 734; and the earth's mean diameter 7926 miles. Supposing the earth to be a perfect sphere, how many square miles are there of each?

Mechanics.

10. A train of 100 tons descends an incline 600 feet, the total height of the plane is 9 feet. What velocity per second will the train acquire the friction be 8 lb. per ton?

11. If the above were ascending the incline what must the horse power of the engine be to convey it at the rate of 20 miles per hour?

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. VII.—STYLE.

THOUGHT and speech are correlates. Ideas are the mind-wealth of humanity, and words are the *media* through which they are circulated. "Unclothed, as yet, in words, or stripped of them, thoughts are but dreams; like the shifting clouds of the sky they float in the mind one moment, and vanish the next."* Human life, in its highest and noblest form, is thought.

"We live in deeds, not years; in thoughts, not breaths;
In feelings, not in figures on a dial.
We should count time by heart-throbs. He most lives
Who thinks most, feels the noblest, acts the best."

"To live is not merely to touch, to taste, to smell, to see, to hear; it is to use all our faculties in the highest condition of development our opportunities permit. This, and not the other, is the *natural* life of man." Who are they who *have* lived, who *do* live? Are they not the thoughts-men of the world? "O'er the dark rereward and abyss of time" let the mind's eye be cast, and who are they that stud the night-gloom of the past, and are recognised as the

"Lights of the world and demi-gods of fame"?

The great *thinkers* of the race. How noble is their vocation who, in the light of consciousness, read the marvels of "the inner life," and reveal them to men! How useful are their lives who, gazing on "the outer world of sense," where

"River, sea, isle, continent,
Mountain and wood and fire-lipped hill,
And lake and golden plain, and sun and heaven,
Where the stars brightly die, whose death is day;
City and port and palace, ships and tents,
Lie massed and mapped,"—

describe to us "all the kingdoms of the earth and the glories thereof;" then directing our minds to other scenes, lead us, in thought, through the far-stretching infinities of space, past

"Yon strange world whose long nights know no star,
But seven fair maidlike moons attending him,
Perfect his sky;"

beyond "Arcturus with his sons," within "the sweet influences of the pleiades," and onward through the immense vastitudes which the Almighty hand has sprinkled with suns and world-systems, thus linking our being with worlds rising above worlds, and systems inter-blending with systems, while at the same time it is protended to the age-distant periods of their unswerving circumvolvings! How honour-worthy are those who, surveying the relations of civil life, the international amenities, the laws of trade, commerce, and agri-

* Bentham's "Essay on Language," Works, vol. viii. p. 301.

culture, the delicate involutions of diplomacy, and the conditions of social well-being, devote their life and genius to the exposition of the great truths which they have learnt, and the ingrafting of these thought-growths in the minds of men! How can we sufficiently value those who, conscious of the mental infirmities of humanity, the duplicities of his nature, his proneness to polluting deeds, his moral vagrancy, his readiness to yield to the suggestions of dishonourable and debasing passions, his want of sin-resistancy, yet endeavour to strengthen man's moral nature, heal his mental diseases, pour "the balm of Gilead" into his wounded spirit, "convince him of sin, righteousness, and a judgment to come," and act like Goldsmith's good clergyman, who

"Allured to brighter worlds, and led the way"?

Thus it is that he, in whose soul thought is wedded to expression, becomes a power, thus it is we reverence

"Men whose great thoughts possess us like a passion
Through every limb and the whole heart; whose words
Haunt us as eagles do the mountain air."

And why ought not each human being to strive earnestly, unfaintingly, to acquire this power and world-reverence? "Man was not made to shut up his mind in himself, but to give it voice, and enter into exchange with other minds. Our power of thought lies not so much in the amount of thought within us, as in the power of bringing it out. A man of more than ordinary intellectual vigour may, for want of expression, be a cipher, without significance, in society. And not only does a man influence others, but he greatly aids his own intellect, by giving distinct and forcible utterance to his thoughts. We understand ourselves better, our conceptions grow clearer, by the very effort to make them clear to another." * Did we rightly estimate the educative influence we wield, the immense potency of our example, we should more truly perceive the mighty responsibilities which lie upon him who cultures not his thought-energies. Are we not all commissioned to become the apostles of wisdom and virtue, and do we shrink from preparing for our life-task? If it be true that "the value of a thought cannot be told"—if it be true that

"He who made us with such large discourse,
Looking before and after, gave us not
That capability and god-like Reason
To rust in us unused,"—

it must be true that the culture of the power of thought-expression is a duty, it must be true that the capacity of translating into words the results of the highest and noblest exercises of our intellect, the deepest and most boundless desires of our souls, our greatest hopes, our holiest aspirations, all that passes in the mysterious thought-realm within, not in the enigmatical confusion and obscurity of unstudied words, but in the starlike beauty and clearness of a precise and eloquent diction, in a style

"Fit to be used by all who think while speaking,"

ought to be regarded as one of the essential qualifications of every human being. To be able, at any time, to couch our thoughts readily, in a judicious selection of fitting and

* Channing's "Self-Culture."

harmonious words—to bring forth the products of our internal consciences “clothed with light as with a garment,” and to repeat and represent them embellished with ideal loveliness, is worthy of intense study. Accuracy in the use of words, orderliness in the arrangement of phrases, precision of style, elegance of manner, in one word, *expressiveness*, is a power deserving of being sedulously aimed at, and laboriously cultivated; “this clothes a composition in the most beautiful dress, makes it shine like a picture in all the gaiety of colour, it animates our thoughts, and inspires them with a kind of vocal life.”* “The greatest truths are wronged if not linked with beauty, and they win their way most surely and deeply into the soul in this their natural and fit attire.”† “A word fitly spoken is like apples of gold in pictures of silver.” “Perspicuous words,” says Hobbes, “are the light of human minds.” And Pascal, in his thoughts “Sur l’Eloquence et le Style,” acutely remarks that “The very same sense is materially affected by the words that are used to convey it.”

This necessity for the study of expression seems the more necessary to be insisted on, because it appears not to be sufficiently recognised by young men that Style is the result of study. There is, of course, a vital connexion between language and thought; but unless we habituate our minds by arduous cultivation to acquire a right understanding of the proper use of words, to recall readily and to employ regularly the choicest and most select phraseology, it will be vain for us to expect that they will be within our reach on demand. There will, therefore, result a stiff constrainedness, an ungainly awkwardness, a lean scantness and barren inappropriateness in our manner of conveying ideas from our own minds to those of others.

There is another error, equally to be guarded against, and which, in a great measure, arises from the false notion of what true excellence in composition is, generally entertained by those who have not attentively studied our vernacular speech.‡ It is, that, in consequence of neglecting to prune their phraseology, to select their words cautiously, to balance their diction with ease and nicety, to become accurately acquainted with the connotations and denotations of the terms which they employ, they suppose real eloquence to consist in bringing together “a gorgeous paraphernalia” of verbalisms, thickly bespangled with prettinesses and grandly sonorous to the ear; and by this false taste misconception they are led eagerly and sedulously to pursue such a method of composing as must necessarily produce that fatal redundancy, that prodigal verbosity and exuberance of speech, that love of betawdried ornateness, and contorted efflorescence which seldom fails of being efficacious in exhausting the patience of the reader, or spreading an opiate slumberousness over the mind of the hearer. A roundabout-ness of expression, a want of terse, forceful, precise, and energetic diction, a diffuseness and overstrained inflation, or a florid wordiness, can be adequately remedied in no other way than by an earnest, incessant, and careful preparatory study of word, and a constant endeavour to find the most appropriate costume for our most trivial thoughts. Thus alone can a large store of accurately-

† Channing’s “Self-Culture.”

‡ The facilities for speaking and writing which our mutual improvement and debating societies, our literary and scientific associations, and our philomathic institutions, may be mentioned as peculiarly liable to abuse in this way, as they have no recognised standard of excellence, no criterion of taste, no umpire to whom questions of a literary nature may be submitted.

discriminated verbalisms be acquired, and thus alone can the proper word be always attainable by the writer or speaker.

Style is the fitting expression of thought; the method in which any given mind organizes, vitalizes, and modifies its ideas in the endeavour to bring them forth from consciousness into the view of his fellow-men; "a picture of the ideas in the mind, and of the order in which they exist there." It is a technical term significant of all those peculiarities of expression by which different minds are distinguished when they strive to paint their thoughts in the hues of language; the incarnation of thought and the essence of the human soul issuing forth pervaded with truth, life, and loveliness:—"Le Style n'est que l'ordre et le mouvement qu'on met dans ses pensées. Si on les enchaîne étroitement, si on les serre, le Style devient ferme, nerveux, et concis; si on les laisse se succéder lentement, et ne se joindre qu'à la faveur des mots, quelque élégants qu'ils soient, le Style sera diffus, lâche, et trainant."* Language being the spontaneous outgrowth of the human mind, the connexion between thought and thought-expression is vital and organic. Not custom merely, not association, powerful influences as they are, could nurture speech were its root not already imbedded in the mind capable of blossoming and presenting its fruitage, when circumstances capable of occasioning its growth-powers to exert themselves had occurred. A genuine style partakes of this same spontaneity. It is at once an embodiment of the specific subject of discourse, and the specific qualities of the intellect of the individual. It is in this latter sense that the truth of the assertion of Buffon, "Le Style est l'homme même"—Style is the man himself—is defensible.

If our opinion regarding the spontaneity of Language and of Style be correct, it will follow that our method of treating this subject must differ widely from that usually pursued by writers on Rhetoric. We cannot counsel imitative studies. We cannot recommend any one of our readers to "give his days and nights to the study of Addison," or any one else. If one would study terseness, force, expressiveness—if he would avoid mannerism, formality, strut, and swagger—if he would avoid unnatural distention, inflation, or attenuated feebleness, as well as an equally unnatural spasmodic trenchantness, abruptness, or apothematicality of expression, let him not attempt to qualify his thoughts for occupying any Procrustes' bed. No imitation of Style, no compound of even the best qualities of Style culled from the best authors, will suit gracefully with your thoughts unless it is homologous with your manner of thinking. Imagine to yourselves the keen, racy, idiomatic, indigenous Style of Swift, translated into the sonorous, magniloquent classicality of Dr. Johnson; imagine the massy-thoughted bullion of thought contained in Foster's "Essays," beaten out into the thin wire and glittering gewgaws, more fit to ornament the border of a cambric handkerchief than to embody great thoughts, employed by the Rev. Robert Montgomery, and you will perhaps gain an idea of the folly of assuming any other Style than that which is natural to your own mind, when supplied with the requisite knowledge of the meaning of words.†

* "Style is only the order and motion which we give to our thoughts. If we link them closely, we compress them, the style becomes firm, nervous, and concise; if we allow them to follow each other negligently, and only connect them by the help of words, however elegant they may be, the style will be diffuse, slipshod, and insipid."—*Buffon's Discours de Réception à l'Académie Française*, page 6.

† "'Consider,' says our Lord, 'the lilies how they grow: they toil not, they spin not; and yet

That which is nature in one man cannot be successfully counterfeited by another. There is a variety in the ways which the mind takes of communicating ideas which such copyist doctrines totally ignores, and hence the signature of one's own mind is continually overacrawled by the name of the party imitated. Each person's Style, if it is desired to be free from jejune, smooth, characterless insipidity, mere effeminate mediocrity, or questionable and eccentric rant, must give full scope to the individualities of his intellect, in all its varieties of culture and mood, fancy and feeling; deep thought and stateliness of mind, calmness and gravity, cool reflection and artless sincerity, may either, or all, be developed in style, provided it is an untheatrical exhibition of the mind. All, however, must be regulated by good taste, and combined with a capability of giving the due amount of executive skill to the accurate manifestation of thought. The fullest and freest play must be given to the mind energies within these limits, while all must be full of fresh, vigorous, individual thought. "Bien écrire, c'est tout à la fois bien penser, bien sentir, et bien rendre; c'est avoir en même temps de l'esprit, de l'ame, et du goût."* Petronius beautifully observes:—"Grandis et ut ita dicam pudica oratio naturali pulchritudine exurgit"—"The great and, if I may so speak, the chaste oration, rises up in its own natural beauty."

From the observations which have just been made, if they have sufficiently fulfilled the design of the writer, it will have become evident that, in his opinion, the cultivation of the intellectual powers, the imagination, and the sentiments, is of far greater importance than the elaboration, even if it were possible, of the most fascinating method of expression. Language and Style are educts of the mind, and follow in their development the natural and constitutional bias or bent of that from which they originate. If, then, the mind be creative, if it be endowed with a tendency to give forth new, vigorous, healthy, genial thought, it will not fritter time and study on the task of re-casting its ideas as they form themselves in all the beauty of nature, into another and more artificial mould, or if it does, it must be contented to appear like those old-fashioned gardens, in which the trees and hedges were clipped and cut into the most formal and fantastic shapes, where nature was distorted, contorted, trimmed and pruned, in order that it might be taught to obey those laws of beauty, which a frigid, unenthusiastic, narrow-minded artificiality had introduced. Nature is always lovely, and a natural style is no exception to this general rule. But such a style can only be the result of the free and unconstrained utterance of thought as it arises. As Style is the consequent of mental cultivation, it follows that the general improvement of the intellect is the surest and safest method of attaining a sincere, healthy, pure, and natural Style.

I say unto you, that Solomon in all his glory was not arrayed like one of these. If then God to clothe the grass, which is to-day in the field, and to-morrow is cast into the oven; how much more will he clothe you? Let us here adopt a little of the tasteless manner of modern paraphrasts, by the substitution of more general terms, one of their general expedients of infrigidating, and let us consider the effect produced by this change—"Consider the flowers, how they gradually increase in size; they do no manner of work, and yet I declare unto you, that no king whatever, in his most splendid habit, is dressed up like them. If, then, God in his providence so adorn the vegetable productions, which continue but for a little on the land, and are afterwards put into the fire, how much more will he provide clothing for you?" How spiritless is the same sentiment rendered by these small variations! The very particularizing of *to-day* and *to-morrow* is infinitely more expressive of transitoriness than any description, wherein the terms are general, that can be substituted in its room."—*Campbell's Philosophy of Rhetoric*, vol. ii. p. 137.

* "To write well is to think well, to feel well, to express well all at once; is at the same time to exert mind, heart, and taste."—*Buffon's Discours*, &c.

At the basis of Style lie the grammatical proprieties which may on no account be violated. The limits which the Grammarian assigns the Rhetorician must occupy. The laws of Language, which are, in fact, the laws of mind, so far forth as they are concerned in thought-utterance, must be strictly obeyed; such inversions and involutions as they allow are admissible, but no others. From these laws there is, there can be, no appeal. But beyond and above these laws the Rhetorician has free scope. The architrave, the pillar, the entablature, the dome, may fitly be added to the more necessary portions of the building; but no decorations are permissible except such as are consonant with use, symmetry, and taste.

Words are the *media* of thought-representation; they are thought-signs, the symbols of the riches of the spirit. With words, therefore, the Rhetorician labours as instruments; they are the means by which he effects his purposes. Whether mere exposition is demanded, persuasion is necessary, conviction or exhortation is to be employed, words are the instrumental agents by which these ends are to be attained. The Rhetorician must therefore recognise the power of words, must know with hair-breadth accuracy the signification of terms, whether singly or combined; for thus alone can his design be effectually accomplished, and the correlation of his words with his thoughts be accurately meted. The whole doctrine of our present article may be concisely comprised in the words of the author of "The Book of Thoughts":—

"To think rightly is of knowledge; to speak fluently is of nature;
To read with profit is of care; but to write aptly is of practice."

Religion.

CAN CHRISTIANS, CONSISTENTLY WITH THEIR PRINCIPLES, RENDER SUPPORT TO THE BRITISH STAGE?

AFFIRMATIVE ARTICLE.—IV.

WOULD W. T. be astonished and delighted by our acquiescence in three of his reflections? We admit our fallibility—acknowledge the advantage of studying St. Peter—and allow the Author of Christianity to be a better judge of christian consistency than ourselves. But we relent no further, though we should stretch the full tether of controversial politeness.

There is not likely to be a cordial agreement between people who misapprehend each other. "He was a very great man! added my uncle Toby (meaning Stevinus). He was so, brother Toby, said my father (meaning Pierskious)." While we have recommended the elevated sentiments of a virtuous dramatic stage, the licence of the extravaganza and short-petticoated ballet has been

thrust upon our charity. Had our weak sympathies melted, how could we have disregarded the awfully funny warning of the moral and short-sighted philosopher? Dr. Johnson, Aristides, and "some faint notions of christian truth," terrify us into propriety.

Since we relinquish the defence of so untenable a post, the enemy kindly challenges a contest for the "gewgaws" of the stage. We invite him to the old Globe Theatre by the Bear Garden of Southwark. The walls are as bare as a conventicle, the scenery borrowed from the bars of Theopis. He will presume upon a bold rhetoric if he apply the term "gewgaws" to the sweetly-enforced moralities of Shakspeare.

If W. T. has Paley's "Horn Paulinae" I

fer to the first section of
ter. He will there find
Paul not only read but
athen poets. Above all,
e has inserted into the
ambic of Menander's:—
ons corrupt good manners."
ote *one hundred and eight*
ccused of suicide! Un-
by didst thou neglect the
Dr. Watts?

here'er 'tis found,
ends, amongst your foes,
heathen ground;
ine where'er it grows."

overshoots its aim; our
have proved too much.
ositions are to be indis-
ined because gross-man-
licentious moderns have
snew would be acceptable
also have foul-mouthed
zed the pulpit by horrible
ey knew would be palate-
men are not to be taxed
their scapegrace brothers,
e neighbour chooses to
n that there is taint in
Such a neighbour, how-

ever, ought first to consult his own genealogy.
The stage is blamed for unravelling villainy;
let us, then, close the play, and trace the
intricate depths of human wickedness in the
narratives of the Bible.

We have no space to vindicate the British
stage by an allusion to the writings them-
selves of her noble moralists; nor would we
presume thus to usurp the position of C. W.
We desire only to reiterate our former argu-
ments unqualifiedly. These arguments do not
find favour because they are based upon a
liberal conception of christian obligations.
We look upon constancy as one of the high-
est virtues, and cannot join in the vulgar
rant against honest puritanism. However,
we desire to be constant to a more genial
Christianity. We are sufficiently morose to
consider ourselves "strangers and pilgrims
upon earth;" but strangers bless the hos-
pitality which supports their strength, and
pilgrims may be made agreeable by the inno-
cent solace of the road. God, who formed
us for immortal destinies, has also tempered
our souls with human sympathies, that we
may exercise them worthily in the drama of
life. Surely our affections were not given
for the sole purpose of betraying us to
death.
H. T.

developed; viz. :—3rdly, "Does the stage
fulfil its vaunted mission?" And 4thly
"Does it or does it not run counter to the
principles of Christianity?" It will be our
chief aim to furnish replies to these two
latter questions. But as the answer to one
involves the answer to the other, and it is
difficult to reply separately to each without
much repetition, we shall consider them
together.

In the first place, we contend that the
drama is too powerful in its effect for the
object intended. It addresses itself too much
to the imagination and affections. It does
not sufficiently appeal to the reason and
understanding. Like intoxicating liquors,
when taken in excess, it inflames the mind,
excites the feelings, arouses the propensities,
and agitates the whole frame. Do you deny
that such is the case, that such is the effect
of witnessing the drama? Then we will
suppose you to enter for the first time one of
the principal London theatres, and to take

your seat in the pit. Upon your entrance you are dazzled by the glare of light reflected from a thousand lamps and sparkling chandeliers. You gaze around; on all sides of you is a sea of human heads. Above you perceive tier upon tier of boxes and galleries, faced and decorated with rich crimson and glittering gold. First, is the dress circle, filled with all the *élite* of beauty and fashion; fair young girls, blooming in lace and muslin; richly dressed dames, adorned with jewellery and trinkets; gentlemen in spruce attire, and bright military uniforms. Above is another tier of boxes, with gaily attired occupants. Above these again rise the upper boxes and gallery, with their quota of human beings. You turn towards the stage. In front of you is the orchestra, with its row of musicians pouring forth the most spirit-stirring or soul-subduing strains. Immediately beyond it lies the stage, with its drop curtains and scenic decorations. In all this glare and glitter, and with the ravishing tones of the music, are you not dazzled and bewildered? You must own that you are. It is the experience of every one who visits the theatre for the first time. And although much of this amazement wears off by frequent attendance, yet we think the most constant visitor is not wholly proof against their effects. Is such a scene as this calculated to suitably prepare the mind for the reception of moral and religious lessons? Presently the tinkling of a bell is heard, the music ceases, the curtain rises, and the stage, with its painted scenes, and the actors in their quaint and ornate costumes, with their fascinating looks, pleasing tones, and graceful movements, are presented to your wondering, admiring gaze. The performance commences, but how much of the moral is attended to? At first the mind is so unhinged and the attention so divided with all around, that but little more than the motions of the actors is noticed; and the words uttered are scarcely heard, much less understood. By degrees the attention becomes more fixed upon the performance, till the whole soul is absorbed in the piece. The imagination and the feelings reign predominant, reason is led a feeble, willing, unresisting captive, to the charms of the scene. You laugh, or weep, or shudder, in quick succession, as your fancy is

touched and your feelings are wrought upon; and that, with as much or greater force than if you were witnessing the reality of the scenes represented. It is the reality to you for the time being: you cannot, or care not, to undeceive your vanquished reason, and despoil your soul of the charms to which you have resigned it. Is such a state of mind, thus uncontrolled by reason, fit for the impression of moral and religious truths? Do you think it is capable of that discrimination necessary to distinguish between the representation of real and specious virtue? Reason, sober-minded, impartial, critical reason, being overthrown and stifled, the heart is easily deceived with specious views of religion and virtue; and the imagination regards everything through an extravagant medium. Theatres, then, if we wish our reason to maintain its sovereignty, and exercise its delegated function, we must forego, and all those places where, and all those things by which it is likely to be trampled upon and debauched. Do not mistake our meaning. We condemn not the proper exercise of the imagination and affections; when rightly attuned and attuned, they are the loveliest and most sublime faculties of the soul; but when subjected to no control, when suffered to run riot and unrestrained, they are the most fascinating, it is true, but the most dangerous faculties of the soul. "Eloquence," says Hume, "when at its highest pitch, leaves little room for reason or reflection, but addresses itself entirely to the fancy or the affections, captivates the willing hearers and subdues their understanding." This may equally be said of dramatic performances. But he adds, "Happily this pitch it seldom attains." We wish we could also make this sentence applicable to the drama. If the foregoing observations are correct, the British stage is neither calculated to fulfil the object of its institution, nor is in accordance with the principles of Christianity. It may be urged that the brilliancy of the lights, the beauty of the decorations, the music, the quaint costumes of the actors, &c., are not absolutely essential to dramatic representation. But do away with all this show, all these accessories, and how much of the attractiveness of the stage would there be gone! Who would then care to visit the theatre, to see a plain, ungarnished, unsophisticated

performances ? We venture to say but very few. But be this as it may, all these dazzling accessories exercise undoubtedly great attraction, and tend to allure the senses and prepare the mind for the delusive scenes of the stage. As long as they have this effect, so long will they be deemed indispensable accompaniments to theatrical performances. For ourselves, we cannot conceive the time when the stage will appeal more to the reason and understanding than at present. When it does, it will in that degree lose its alliciency and popularity, and being insufficiently supported by the public, will, in consequence, terminate its existence. But while it appeals so intemperately to the imagination and the affections, so long will it be an alluring snare to young and old, rich and poor. It was not St. Paul's wont to give instruction beyond the ability of his hearers to receive it beneficially. In addressing his Corinthian converts he writes, "I have fed you with milk, and not with meat: for hitherto ye were not able to bear it, neither yet now are ye able. For ye are yet carnal," 1 Cor. iii. 2, 3. If, then, the stage offers instruction too strong for mental digestion, it not only misses its professed object, but at the same time violates, or at least conforms not to the principles of Christianity, and we have therefore a sufficient reason therein for withholding from it our support.

Again, the dramatic art is a delusive art. The greater the delusion, the more effective, the more captivating and perfect it is. Its very existence depends upon its power to deceive, and to impress one with the idea that what is witnessed is actuality itself. May it not be reasonably questioned whether a deceptions art be a proper or a probable means of teaching truth ? — of teaching frankness, openness, uprightness ; abhorrence of falsehood, deceit, equivocation ? Is it not probable that the frequenter of the theatre insensibly acquires a habit and an aptitude to deceive ? Surely the constant attention paid to the avowed practice and open profession of an imitative delusory art, cannot fail to exercise a morally baneful influence in the direction mentioned.

Once more, admitting for a moment that the pieces represented are designed for the purpose of inducing man to choose the good and avoid the evil, by exhibiting the love-

liness of virtue and the deformity of vice, do they effect this object ? We fear not. The nature of man is so depraved (scripture has declared, "that every imagination of the thoughts of his heart are only evil continually"), that the evil passions depicted, and especially those indicative of appetency and carnal desire, are far more likely to take hold upon him when his reason is subdued, and the imagination and affections hold triumphant sway, than are the calm and sober virtues. The passions and evil inclinations of our nature are easily—alas ! how easily—aroused from torpor, and called into unruly activity ; and when aroused, how averse are they to restraint or subjection ! Man, then, should be careful how he enters upon scenes where they are likely to be awakened. "Pray that ye enter not into temptation," was our Saviour's injunction to his disciples ; those who support the stage would do well to meditate upon these words. Further, as vice is of quick growth, and difficult of eradication, so virtue, on the contrary, is tardy, and can only be gradually cultured. The violent *ad captandum* teaching of the stage is not, therefore, suited to the development of virtue. It cannot be poured into the heart as through open sluice gates. The evil passions are not to be subjugated and ousted by any startling or sudden assault. It is true they may be temporarily checked thereby, but they will quickly recover their wonted power and dominion ; and assail and take possession of you, in return, with bifold fierceness and security. The theatre, then, is not the school for teaching and training the heart in sentiments and deeds of virtue.

If the stage be not fitted to teach virtue and morality, it is still less fitted to teach religion. The appeals so frequently made to God's mercy, justice, truth, and his other attributes, in simulation, and for a commendation object, is surely a mockery, a taking of his name in vain. Let those who see no harm in these feigned appeals, bring—as J. E. P. has recommended—this commandment to their remembrance, "Thou shalt not take the name of the Lord thy God in vain ; for the Lord will not hold him guiltless, that taketh his name in vain."

But people do not frequent theatres for the sake of moral and religious instruction. Their sole object is pleasure and amuse-

ment. Such being the case, they are not likely to derive benefit by the instruction of the drama, supposing it affords any. That no virtuous impressions are made, I think is sufficiently evident from the uproar and laughing that immediately ensues upon the falling of the curtain and the closing of the theatre. Judge also by your own experience. But if pleasure be the only object of the playgoer, he had better seek it in the quiet and comfort of his own home, by his own fire-side.

"Needs he the tragic fur, the smoke of lamps,
The pent-up breath of an unsavoury throng
To thaw him into feeling; or the smart
And snappish dialogue, that flippant wits
Call comedy, to prompt him with a smile?
The self-complacent actor, when he views
(Stealing a sidelong glance at a full house)
The slope of faces from the floor to th' roof
(As if one master spring controll'd them all)
Relax'd into an universal grin,
Sees not a countenance there that speaks of joy
Half so refined, or so sincere as ours."

The Task.

We have hitherto been speaking of the unsuitability of the stage as a school for morality and religion, and of the evil effects of dramatic representations upon the people generally. But there is one class of people upon whom they have perhaps a still worse effect, and justifies us in specially noticing them; I mean the actors themselves. They are acting, it may be, with a view to instruct, but at the same time with a view to allure and deceive. The greater their powers of imitation and simulation, the greater the delusion, and the greater their own success. It is true they may feel and appreciate much of the sentiment, and enter deeply into the spirit of the piece enacted (for it is essential to good acting that they do), but, nevertheless, dare any one assert that their whole souls are wrapt in the words and sentiments to which they give gesticulated and impassioned utterance? If they do not, think of the lessons they are learning in the art to deceive and beguile. And having the power, and knowing they possess the power, to feign and simulate feelings far from their hearts and intentions, think you occasions will never occur when they will be tempted to put in practice their deceptions art to their own hurt and the hurt of others? Deceit, however, is contrary to the principles of the christian religion; to countenance it, or to encourage

others, by any means, in the cultivation of the art of deceiving, must therefore be likewise contrary to christian principles.

But, doubtless, much of what they so impassionately declaim upon the stage is deeply felt. At one time they are the words of ardent love and vehement desire; at another time, of cruel hatred and savage revenge; now of playful banter, and now again of withering scorn; at one moment a curse is invoked, at another moment, God is blasphemed. Can these sentiments and words be uttered, even without thought or feeling, with impunity? Who will say they can? But when uttered in the fervour of enthusiasm, how much greater, then, must be the evil! Shall that tongue, taught to curse and blaspheme so volubly and passionately upon the stage, never break out into cursing and blaspheming when off it? We fear that the sentiments and the words they are accustomed so energetically to declaim upon the stage, do only too surely and naturally find vent, upon sufficient provocation, when off the stage. But not alone do the actors learn to sin in words and thoughts. In love scenes, for instance, the passionate outpouring of sentiments of love and love's desires, is not alone the dreadful lure. The position and actions of the two lovers, the music, the tasteful costumes, &c. all work their baneful spell. And we fear alas! unhallowed desires and their gratification too frequently result from the mimic words and actions; and this may account for the generally admitted fact, the loose morals of so many of those who follow the stage as a profession. Can Christians, consistently with their principles sanction and encourage, by their presence and support, scenes which lead to such deplorable results? What says St. Paul, the Epistle to the Romans, xiv. 13? writes, "Let us not therefore judge of another any more: but judge this rather that no man put a stumblingblock or occasion to fall in his brother's way." And again, in the 21st verse of the same chapter "It is good neither to eat flesh, nor to drink wine, nor anything, whereby thy brother stumbleth, or is offended, or is made weak." The support afforded to the stage, gauged by this test, will, I think, be found to counter to the principles of Christianity.

IS WOMAN MENTALLY INFERIOR TO MAN?

NEGATIVE ARTICLE.—II.

THE moral and intellectual difference between the sexes is no less than the physical. In the physical frame nature has assigned to the man strength, activity, and vigour; to the woman, beauty, delicacy, and grace. The features of the one are best calculated to inspire admiration and respect; those of the other, affection and love. The one is adapted for danger and toil; the other, for the duties of domestic life.

Nor in the mental organization is the division less broad and distinct. Active courage, sagacity, and firmness, are not more the property of the man, than passive endurance, tact, and persuasion, are of the woman. Though the former may be better qualified to shine in the camp, the senate, or the exchange; the latter, in training future generations, in creating and supporting the amenities and courtesies of social life, and in softening down and refining the more rugged and sterner portions of man's nature, has a field of action as wide, and in my opinion as important, and requiring an equal amount of ability to excel. This is, in fact, the whole question—Is the sphere of woman as important as that of man? Few, I think, will deny her fitness for her duties; their relative value is, then, what we have to consider. This seems to me a fairer way of stating the matter than to attempt to prove, from scattered instances, her equality to man in his own sphere, in which, neither by constitution or inclination, she is qualified to excel; and to expect her to do so is as absurd as to require of the deer the strength of the ox, or of the ox the agility of the deer. A woman who thrusts herself into and usurps man's position, is as far from being an ornament to the female sex, as a fop or a coward is to the male. A Semiramis is as odious as a Sardanapalus.

But to proceed. The mental improvement of mankind has need of two agencies—energy to remove the obstacles which prejudice or barbarism may have placed in its path; elegance and polish, to soften the fierce pas-

sions evoked in their removal. The edict of an autocrat may compel men to appear civilized; it is not till the influence of woman begins to be felt that they will become so in reality. To what other cause but the influence of woman can we attribute the gradual progress of civilization among the Gothic barbarians who overran the western division of the Roman empire? While, to the lack of that influence we may, with equal propriety, assign the stationary and retrograde state of the tribes who conquered the east. The importance of her humanizing agency may be estimated when we consider what is the proper meaning of civilization. It does not consist in the mere acquisition of knowledge, or the progress of the arts and sciences; these are only the means and instruments of it: their final object is the regulation of the passions, the subjection of the corporeal to the spiritual, the removal of those prejudices and differences which are so hostile to our comfort. What a mighty effect in promoting these ends must a sex have, possessing such a natural refinement of taste, so susceptible of pity, so inclined to peace, so little prone to the darker passions, and so easily influenced by the tender ones! How often, too, do we find that in the hour of difficulty and trial, when active courage is of no avail, and man's energies seem unnerved and his spirit broken, that female endurance, female fortitude, meek, uncomplaining, yet assiduous perseverance, have consoled the afflicted, imparted hope to them that were ready to perish, and frequently conquered calamities which seemed to the sterner sex insuperable! Where man's work ends, woman's begins. The temple of civilization has its stately and lofty columns, its broad and massive arches; but how shapeless and forbidding would these be unless there were superadded the elaborate carving, the glowing canvas, and the life-like statue. The last may not be actually so needful as the former, but their production requires mental power as great, though of a different nature. I

would not claim, with some, for women the duties and the privileges of active and busy life. In these she is decidedly inferior to man, and by undertaking them she deservedly forfeits the respect and affection due to her sex. Such characters as Elizabeth of England, and Catharine of Russia, while they retained the foibles and weaknesses of their sex, lost its attractions, seem to have been exceeded in mental energy by the statesmen around them, and only to appear great by comparison with the rest of women. To female vanity and jealousy they joined the unscrupulous ambition of a Cæsar and the relentless

cruelty of a Tamerlane, without imitating the clemency of the one or the justice of the other. Woman's mental powers are only great when employed in the proper direction; so long as she so employs them, she is not only equal to man, but exercises an incalculable influence over him. She then holds a secret, but not the less a powerful, empire, and man willingly submits to it. Society, the legislature, literature, the arts, are ruled by women perhaps more than by men; but it is by their exercising the persuasive powers in which they excel, and not the commanding, in which they are deficient. S. A. J.

AFFIRMATIVE ARTICLE.—II.

SUPERIORITY and inferiority are relative terms which may be well applied to the different orders and classes of creation; but when, as proposed by the question before us, the most important being in creation is selected as the object of inquiry, that being again severed into sexes, and the mental powers of each sex set in juxtaposition to the other, the matter assumes a very different and not less delicate feature. It also involves the necessity of close investigation into the nature and character of each sex individually as well unitedly as a species. Great care is also required in order that due honour may be given to each sex, without infringing upon or detracting from the one for the sake of the other. The subject is a large one, and we shall at present, therefore, confine ourselves to general views.

It is an important truism that in creation every order and class has its peculiar sphere and office; and also that there is to be found in each member of a class its peculiarity or mark of identity, in contradistinction to all others. It may, therefore, be fairly argued, that in the wisdom of the great Creator, each specific being was created for an end peculiar to itself. Every animate creature may, therefore, be presumed to possess wisdom or instinct peculiar to that end; and this may, in a certain sense, be considered to constitute superiority, whether compared with its own species or the creation generally.

Although this statement may appear to be somewhat beyond the limits of the question before us, it may be found useful as a general argument, and assist us in consider-

ing the real point at issue in directing our attention to the relative position of those most noble of all God's creatures—man, and his helpmate, woman. It cannot be disputed that, so far as headship is concerned, man stands first and foremost. That man was created before woman, we learn from holy writ; and also the fact, that the whole creation was placed under his hand, and creatures called by such names as he selected, before woman appeared upon the globe. When she did appear, it was not to take from man the office previously assigned to him, nor indeed do we even learn that she was commissioned to interfere therein—at all events, not in contravention of man; but the duty assigned to her was that of a helpmate, to act under the direction of and assist man in his work. We also learn from the same source, that the moment she was tempted to assume a position of independence, and relied upon her own wisdom and ability to confront the serpent, she fell, and thereby entailed misery upon her whole posterity. Indeed woman, even by the extraordinary means of her creation, is entirely precluded from assuming a position of superiority over, or independence of, man, for she was actually taken from him, and must be considered a part of himself, and therefore inferior to him.

The office, however, assigned to woman was a peculiar one, and she was endowed with wisdom peculiarly adapted thereto, and may fairly be presumed to possess ability and tact in matters within her sphere superior to man.

The mental superiority or inferiority of

man or woman cannot be ascertained from a partial or one-sided view, nor arrived at by the consideration of any particular capacity or feature, nor indeed by the selection of mere individuals, but each must be viewed in class and as component parts of society. There is also a distinction between wisdom and knowledge which must not be overlooked. Some women may possess capacity for learning and acquiring knowledge, far superior to many men, and had they the same advantages, might even surpass the opposite sex in many branches of literature. Poetically, woman is often found to excel; in the finer feelings and sentiments of the mind she may, perhaps, be said to bear the laurels (for these are especially within her sphere).

Although all these attributes are beautiful and valuable, still it is submitted that neither one feature nor another, nor indeed the whole combined, constitute mental superiority in the sense in which we are bound to understand those terms. It is in the great powers of ruling, sound judgment, and discretion, that superiority of mind is to be sought; and herein, doubtless, man surpasses woman, however far advanced she may be in the acquirements before alluded to; and however inferior in such attainments may be the unfortunate lot of her husband, still, in the attributes which belong peculiarly to the man, and come within his sphere of action, she is, doubtless, inferior. For a

proof of this assertion we need go no further than to the domestic circle of him whose wife assumes superiority, and takes the position of ruler; the result of such a course is invariably the destruction of order and peace, and instead thereof is to be found, in almost every instance, the greatest possible disorder, discontent, and confusion.

We trust the foregoing remarks will suffice to show that although viewing the sexes as a whole, we feel bound to conclude that mental superiority must be ascribed to the man; still it is far from being our wish to detract from or undervalue the capacity and excellency of woman; on the contrary, we are most anxious to ascribe to her all that consistency will allow, and to encourage her every effort to acquire those literary attainments and accomplishments which lie within her sphere.

Man, the noblest of creation's birth,
Reigned supreme throughout the earth,
Alas! without companion blest.
In vain he sought creation's whole,
In vain, there was no human soul,
Till God did give him rest.

Then from man's side God took a rib,
Then closed he up the flesh instead,
And with it woman form'd.
Man slept, indeed, but little thought
What sleep would do, what sleep had wrought,
Awoke, and woman found.

Politics.

OUGHT MONEY TO BE INTRINSIC OR SYMBOLICAL ?

INTRINSIC.—III.

NOTWITHSTANDING bullion committees and blue books, currency laws and banking acts, there ought to be no intricacy about a simple question which practice will assuredly answer for us, if we dally too long over our fine-spun theories. To a commercial people money is a necessary of life; and, when common sense and interest combine, we anticipate that they will not blunder much. Hence, the existence of an intrinsic currency is presumptive evidence in its favour. If, while

seeking the corroboration of principles, we make no dissertation upon the perplexing technicalities of trade balances, bullion prices, monies banco, agios, and similar niceties, our silence must be laid to this account—that they have nothing to do with the argument.

Mr. Harvey furnishes an excellent text, when he says that "Labour is the source of all wealth, and money should be only the certificate or memorandum of wealth." Commercial systems and monetary regulations

direct and facilitate the acquisition of wealth, but cannot themselves create it. Political economists cannot contrive a scheme which shall supersede hard work and industry. England is rich, because her men and machines are incessantly producing: she will continue to grow richer and richer every year so long as she adds horse-power to horse-power, in spite of a thousand dull volumes upon the circulating medium. There is no call for astonishment should a nation flourish after a bankruptcy, or a repudiation, or a currency crash, because these are only symptoms of suspended animation, and not of death. The laws of nature, defying the Chancellor of the Exchequer, will continue to yield crops and merchandise to the hand of repentant labour. Whether we are disciples of Adam Smith or Quesnai, we must not, while investigating details, allow important truths to evaporate. Agriculture, manufactures, and commerce, as they appear in books, may disguise their operations under the pretence of scientific intricacies; but see them in the field, the workshop, and warehouse, busy in straightforward, honest efforts to amass and distribute the productions of the "teeming earth," in order to support the existence and enlarge the gratifications of the family of man. Under the comfortable assurance of such facts let us proceed to consider the use of money.

Money has its origin in the inconvenience and inadequacy of barter. A nursery-tale analyzation is scarcely required to show the impossibility of payment in kind wherever the division of labour has been accomplished. The mason who has erected a building in a distant neighbourhood cannot take home piles of food and clothing in remuneration, for this would be physical absurdity. He accepts instead an equivalent in money, which will procure him at home, and at convenient seasons, whatever food and clothing he may require. In this transaction, which is a type of others, money acts merely as a medium, a certificate, or counter. It has no intrinsic power to clothe or feed; it cannot force itself upon the acceptance of the tradespeople; it is a sheer unfructifying piece of metal, perchance, or salt, or paper. It is a ticket, to which common assent has imparted value and currency; and, while it is honoured by the payment of the commodities whose price it represents, it is, for the purposes of com-

merce, equal in value to those commodities. Withdraw the common assent, and the ticket, losing its honour, resumes the humble destiny of rags and metal. The truth of a proposition is frequently made more palpable by a demonstration of its converse. Imagine, therefore, a nation to be suddenly deprived of its cash; in the nature of things it will recur to the primitive simplicity of stark barter; commodities will be bought with commodities, instead of being purchased with coin, as heretofore. So cumbersome a system will work its own remedy; the weekly labourer and monthly servant grumbling to receive their pay in bulky and perishable articles—the merchant oppressed with the tardy progress of his unwieldy business—the whole people, continually anxious, incommoded, reduced to a savage existence—will cry out for a restoration of the ancient plan, the convenience of the trustworthy tickets.

Money, then, is a substance to which the necessities of mankind have affixed a representative value. Now, the maintenance of an assumed value depends upon two conditions—the mutual understanding and the mutual faith of those who conspire to support it. Unless the value of money be precisely determined and universally recognised, there will be constant inconvenience and liability to fraud: unless there be implicit faith in a currency, every extensive commerce will be checked. Consequently, a community, in order to prosper, requires money, the value of which, once fixed, shall be secure from tampering interference, and the credit which shall be steady and perpetual.

There are only two methods by which a substance can be converted into money. One method is, the attaching an arbitrary value to something in itself worthless, as in giving to a piece of stamped paper the estimation of £50. The other method consists in adopting some substance which has been obtained by labour, and in establishing the price of the labour as the exchangeable value. This is exemplified in the case of metallic coin: a sovereign, for instance, is equal in worth to the cost of its digging, purifying, shipping, and coining. All the money in the world exists under one or other of these categories. Bank-notes, exchequer-bills, bills of exchange (inland and foreign), bonds and coupons, have an arbitrary valuation affixed, and are symbolical money. Salt, hides, shells, &c.

Tan, doubloons, pence, shillings, and pounds, were obtained by labour, and bear the honourable denomination of intrinsic money. Does the symbolical or intrinsic species give to the bartering propensity of mankind the more trustworthy guarantee?

Fixity of value and credit for currency we demonstrated to be indispensable requisites of the exchangeable medium. Symbolical money will not pledge itself to possess either: from birth it presumes to disregard suspicion. But political economy is not satisfied with complementary pledges. Value cannot be fixed or credit confirmed so long as the issue of superfluous paper by needy exchequers and hungry engravers suspends mistrust over a nation. And in what manner an effectual control can be placed over these industrious copper-plate printers will perplex the thirtieth century, moral and republican, but still human in its generation. Why are the bills of a reputable merchant accepted? Because it is believed that he has property to back them; and reasonable credit is justifiable on the ground of expedience. But when a crisis brings ruin upon a score of houses, where is the value of their "promise to pay?"—flown with their credit, which alone supported it. Credit, in this case, reposed unworthily upon "an honourable man" and his flimsy bills: in like manner would it unworthily repose upon an honourable government and its flimsy notes.

Intrinsic money, on the other hand, having a value equal to the cost of its creation, will not recompense the secret fraud of the private or official speculator. A necessitous ministry will be powerless to regulate its issues, which will be accommodated to the natural laws of commerce, being plentiful or scarce as the demand shall strengthen or relax. If the supply whence the circulation is in the first instance obtained be steadily proportioned to the growing wants of an increasing population and an extending business, the value of money will preserve the constancy which is inseparable from it. Presuming, for argument's sake, the possibility of a circulation so adjusted, we shall obtain a perfect currency—fixed in value, because no one can manufacture it more cheaply, and because government cannot flood or contract the market at pleasure—established in credit, since no one can refuse a tender essentially valuable, enforced by custom and law.

The commercial transactions of civilized people rely upon the system of credit to a vast degree. Trade would be hampered, and judicious speculation wholly checked, if every bargain were struck with cash. The evils of rash credit must not be attributed to the use of money: were barter re-established, it would be found useful—in fact, necessary—to allow debts to stand over; and a debt is still a debt, whether due in goods or coin. If merchants consent to accept their creditors' paper certificates—if tradesmen choose to bandy these certificates—if capitalists will put faith in Spanish honour intrusted to pen and ink—they tempt fortune, wisely it may be or unwisely, yet of their own free will. Paper there always will be, and more and more of it as enlarged connexions and facilitated communications render the employment of it more desirable and more secure. But it would be cruel and most pernicious injustice to compel men against their will to traffic with unsubstantial paper, which might be depreciated at any moment by the fraud of government or individuals. Forgeries now are comparatively rare, because they have to contend with the prudence of those who recognise familiar signatures and intricate designs; but they would be unlimited, if millions of people were compelled to use notes of low amount, whose validity, obviously, they could not ascertain.

We presumed the possibility of adjusting the original supply of intrinsic money to the demand. Since the discovery of America, the quantity of the precious metals obtained from the mines has never exceeded the growing avidity of commerce. Europe may have had less, but certainly she has not had more metallic money than she required. The produce of the Californian and Australian fields threatens to disturb the existent equilibrium. Abundance of gold, as of any other commodity, will tend to cheapen it; and until, by the failure of the supply, the price of gold be again permanently settled, the inevitable advance in the price of other articles will cause great perplexity and dispute in the matter of wages, rents, and other payments. Whether parliament could contrive a system by which a progressive accommodation might be effected, is a subject most digressive and difficult. A universally-diffused commerce will, of course, absorb more of the metals than has hitherto been required; but, should

the mines be inexhaustible, recourse must be had to silver or platinum; or we may even anticipate that chemistry will compound a substance, expensive, durable, portable, difficult of imitation, possessing all the requisites of intrinsic money. The substitution of gold for a corresponding amount of paper to be withdrawn is inadvisable, for this reason,—that gold is a portion of the community's capital, incapable of increase by germination—a dead mass; and therefore, however small a quantity exists in a country beyond the need, is so much capital lying at waste.

Leaving practical details to the suggestions of the future, and considering the main question in its theoretic principles, we conclude that an intrinsic currency ought to be the basis of a monetary system, because the credit which justifies the employment of symbolical money is not universal, nor can it ever become so. The progress of time may abolish nationalities, and thus admit a world-wide reciprocation of paper; but there will never be so complete a reliance upon personal integrity as to render needless the *in terrorem* enforcement of hard cash.

The benevolent but obscure intentions of J. H. are not sufficiently developed to be refuted, except by the tenor of a general argument. Money would be cheap enough, and beyond his liking, upon the symbolical system. Fifty million pounds' worth of coined metal, accumulated through many years, is not too expensive for the service it renders, especially if it be indispensable. Englishmen pay a great deal every year for their clothes

and food, and a great deal also for their ships, and carts, and railways, because these things are useful. If they grudge to pay for so useful an article as money, let them do without it, if they can; or try paper, if they choose.

Mr. Harvey hits hard when he asks why a whole population have turned into grubbers and cinder-sifters. Will he describe his protection against the forgery of paper? The Australian grubbers are, in effect, forgers; but their trick will in time be frustrated by the failure of the gold, the legal supremacy of another metal, or the introduction of a valuable substitute. How will the symbolical mints maintain their credit against skilful imitators? A spurious sovereign can be detected and tested; a spurious five-shilling note will be as good as its better—a pretty bull, but a sad joke. The scheme of exchanging tokens with a labour value by means of Socialist banks is liable to the objections already adduced, and repeated failures have brought it into bad repute. Besides, the scheme cannot be separated from Socialism, the merits of which may be great, but have nothing to do with them at present. Many considerations connected with our subject we have necessarily left untouched, and the ramifications of the question would occupy a treatise. We have simply endeavoured, in a comprehensive and conclusive argument founded upon the nature of things, to establish the necessary qualities of money; and the conviction stands that a currency ought to possess the foundation of intrinsic value.

H. T.

SYMBOLICAL.—III.

THIS discussion will not possess much of interest or importance in the eyes of anti-bullionists, unless we adopt that strict interpretation of the word money which makes it synonymous with *legal tender*. It will be known to most of your readers that all money, commonly so called, is *not* legal tender: that is to say, it is not such an instrument as a debtor can legally compel his creditor to accept in satisfaction of his claims. For instance, copper is not legal tender, neither is silver, above a certain limited amount. Some few years ago *paper* was legal tender; now gold alone is so. The question we propose to ourselves therefore is, Ought

the *legal tender* of a country to possess intrinsic or a representative value? or the indefinite original words of the question, "Ought money to be intrinsic or symbolical?"

It is a mistake to suppose that it is part of the necessities of our case entirely to condemn the use of metallic currency. We believe that, for the ordinary purposes of trade, we could not propose an advantageous substitute for our present silver and copper coinage. Paper would be impracticable for small sums; wood would be unsafe; a metallic currency of other than intrinsic value would, in a greater degree than wood, be

posed to the depredations of coiners. I therefore prefer copper and silver to any other kind of currency of the same value. After this avowal, then, any wit or wisdom which may be expended in the attempt to prove the impracticability of a representative currency for small values, will be misapplied and expended in vain.

At this point, however, my favourable opinion in respect to a metallic currency entirely ceases. Gold money, in every possible form, I consider an unmixed evil.

My first charge against money, or legal tender of intrinsic value, is that it is hopelessly insufficient for the supply of our commercial necessities. It is a high estimate to give £40,000,000 as the amount of our present legal tender. And this amount, it must be borne in mind, cannot be so largely extended as to keep pace with our increasing wants. Add to this £40,000,000 of bullion £37,000,000 of notes, the amount of our paper circulation, and we have thus a circulation of £77,000,000, exclusive of purely commercial money. Well, then, if our metallic currency is sufficient for us, we may at once sweep away the whole stock of our paper currency. To do this, however, would be to reduce our circulation nearly one-half; and unless our present circulation is really superabundant, in a superabundant degree, the country could no more stand it than it could to have our little island compressed into half its present dimensions. But we may judge, by the light of history, of the probable effects to ourselves of such a reduction in our circulating medium. We had such a contraction of the currency in 1816: and in reference to the panic of that period, "Mr. Lloyd, the eminent banker, deposed before a committee of the House of Commons, in 1819, that the circulation of the country was at its highest in 1813 and 1814, but that it was reduced nearly one-half in 1816 and 1817. The consequence was a scene of agricultural and monetary distress of unprecedented severity. The total number of bankruptcies in 1815 was 1,285; in 1816 they increased to 2,089, being an addition of fifty-five per cent. in one year. The government became alarmed, and the restriction of cash payments was further extended from July, 1816, to July, 1818. By this means the downward course of industry was promptly stayed. The bankruptcies, which in 1817 were 1,575, were reduced in

1818 to 1,056, being a decrease of thirty-three per cent."*

Here, then, we have, as the result of contracting the currency to this extent, an amount of individual distress and ruin indicated by 6,005 bankruptcies in one period of four years.

Sir James Graham has stated, "on the authority of the most competent judges," that "the losses sustained at that period by individuals, counterbalanced all the profits of all the bankers during the war." From this we may judge of our probable condition were we to reduce the circulation to any considerable extent, as we should do were we to discard our "worthless rags."

But if any further evidence were necessary to prove that any amount of metallic money we can command would be totally insufficient for the supply of our monetary necessities, it is supplied by Sir Robert Peel himself. In the bill which he introduced, in 1846, he gave to the Bank of England an issue in notes of £20,000,000; to the country banks, £8,000,000; to the Scotch, £6,000,000; and to the Irish, £3,000,000: £37,000,000 in all: *thirty-one millions* of which rest upon no metallic basis whatever!

Are we not, then, justified in our strong condemnation of an intrinsic legal tender, when we see the "apostle of bullionism," in remodelling our monetary system, providing for a circulation of £31,000,000 of "fimsies?"

Our next charge against money possessing intrinsic value is, that it has a natural tendency to create those disastrous commercial panics which in previous years have brought this country to the very verge of revolution.

There are but two ways in which gold coin can be made available for purposes of currency. The first is, to make the coin of any size and weight, simply affixing to it a mark to indicate its weight and fineness, and leaving its value to be determined by the current price of gold in the market. But it will be seen at once that this system could not be carried out, on account of the vast amount of trouble and inconvenience to which it would give rise. The other way is, to make the coin of some definite weight and fineness, and to give it a fixed denominational value, at which it shall be current throughout the kingdom.

But, it is also quite obvious here, that, in

* Duncan's "Letters on Monetary Science."

order to give the coin a definite and fixed value, the price of gold itself, in the market, must also be fixed; otherwise the plan would offer a premium to private speculators to take advantage of the fluctuations of the market, and to derive a considerable profit by a brisk, though clandestine, competition with the mint. And it will also be quite evident, that the price so fixed must necessarily be a low one, else, being higher than that of neighbouring countries, the evil just noticed would not be obviated, while that of smuggling would be added to it. But supposing, however, these two points to be gained, we should then possess a gold currency which would possess the apparent double advantage of not being subject to any fluctuation in value, and of being current everywhere within the limits of the United Kingdom. Now, most of your readers will have discovered that we have sketched the precise plan adopted with reference to our present gold coinage; and, I suppose, many of them will think that, by its adoption, we, as a nation, have advanced a considerable way towards perfection in monetary science. But let us now see how the system works.

A time of national prosperity is a time when the bulk of the population is employed at good wages, and, consequently, of high prices and large profits. Now at such a time it must necessarily happen that gold, being tied down by law to a certain dead-level price, cannot participate in the general rise of prices; and it therefore becomes the cheapest commodity we have. Under these circumstances, then, we are visited by the foreign merchant, and gold being to him not simply money, but a commodity, and, as such, the cheapest in our markets, he naturally takes it away in preference to anything else. This causes a drain of the metal from the country, which would be nothing were it simply *gold*; but being the *sole legal tender* of the country, it becomes of serious consequence. The first effect is to cause a ruinous competition in trade, and ruinous discounts at the bankers: in a short time follows the *panic*; banks are besieged; bankruptcies become ominously frequent; and then the full tide of consternation and misery rolls over the nation, under the effects of which it lies for the time prostrate and helpless.

There is nothing of imagination or of exaggeration in this statement of the results

of the system under notice. It is *not* a "sketch by fancy drawn," but a fair transcript from the page of English history. We have already presented one piece of evidence respecting these effects, and we now offer another illustration of the same truth.

We wish to impress upon our readers that this memorable panic (1825) arose solely from the want of a single commodity, gold. All other commodities were plentiful. The prosperity of the country is attested by the speech from the throne in that year (1825). "There was literally a whole population," says Mr. Francis,* "*with food in abundance staring them in the face, unable to procure it, as nothing but gold would be taken.*" "Many a firm, of unimpeachable honour and unquestionable solvency, was compelled to bend before the storm. It was remarkable that the question would soon be, not Who goes? but Who stands?" "It was stated that the distress arose from want of confidence in men able to pay 40s. 50s. and 60s. in the pound. The officers of the mint were ordered to coin sovereigns with all possible dispatch; they worked night and day: during the space of a week 150,000 were manufactured every twenty-four hours. But this activity did not stay the panic, or remove the pressure; and the reason is obvious. The sovereigns were still kept down to their mint price, and being cheaper than other commodities, were exported as fast as they were coined. The measure did not help British subjects, but enriched foreigners."†

Now we ask, in conclusion, would or could these things have happened had we had a legal tender of representative money? We say, No. Foreigners would have had no inducement to abstract our paper money, which to them *would* be "worthless rags:" and while we were allowed to retain our instrument of exchange, we should also have received the enhanced price of our goods: because, evidently, the foreign merchant would have to make his election between our goods and our gold; and, if he chose the latter, *being paid in paper* for the goods which he sold, he would have to buy it at its market price. But, as it would, at that price, be of less service to him, as a merchant, than manufactured goods, he would most certainly

* "History of the Bank of England," vol. ii. chap. i.

† Duncan's "Letters on Monetary Science," p. 3.

have taken the latter, and thus would have helped to promote the prosperity of the country, instead of impoverishing and ruining it.

Social Economy.

WOULD COMMUNISM PROMOTE THE HAPPINESS OF MAN?

NEGATIVE ARTICLE.—VI.

In order to come to a just and impartial conclusion on the subject of our present debate, we must consider Communism in its principles, and inquire what would be its effects.

By the term Communism, I understand that principle which would render the earth and all it contains—all its productions, whether animal, vegetable, or mineral, and the labour expended on such productions—as the common property of the human family. It advocates equality of labour, and equality of the profits of such labour; that the wisdom of the philosopher and the folly of the clown are both equally the property of the community; and both are to be rewarded, not in proportion to the merit of each, or the good respectively done, but each is to receive a like share of the blessings of this life. And here we may ask, at the outset, Is it consistent with human nature for the philosopher to wish that the profits of his study should be shared by the illiterate? No; the industrious person would not wish the wages of his labour to be distributed amongst every idler, who had not contributed at all to such labour. Yet this is what the Communists wish. They would have the industrious and the lazy, the wise man and the fool, the learned and the unlearned, the philosopher and the clown, all placed on the same footing.

What form the great inducements to labour? The fear of want is, perhaps, the first motive. Yet, by the principles of Communism that fear would be taken away. A person would know that he need not exert his power, for he would partake equally of the general profits, whether his talent were used or not. He would see that if he were the most industrious, skilful, and cunning workman, that he would receive no greater remuneration than the idlest and most stupid member

of the community. Another inducement to labour is the desire of acquiring property. Yet the Communist would take away this, by depriving a man of the possession of anything that was not necessary to his actual and present wants. What, then, would be the effect of Communism? Would it not create idleness, the greatest of all evils? The progress of literature, science, and art would be immediately stopped, and, as F. F. remarks, we should soon become "a mere food, clothes, and shelter-producing community." The community would not consent to support the astronomer, the traveller, and the mechanic for a lifetime in return for the chance of their discovering a new planet, a new land, or a new piece of machinery. But suppose some were supported in order to study in each different department of science, while others were condemned to the performance of manual labour. Is it possible to suppose that all would be satisfied with the department of business allotted to them? One man's work would be easier than another's. All would be discontented, all would be grumbling. Truly this would make a wonderful exhibition of "*a HAPPY family*" of *Communists*. Suppose all were employed in mere manual labour. Then I would put the question before proposed by F. F.: If one man can produce in ten hours that which takes another fifteen, how are they to be treated? Are both to work the same time? If so, would not this cause great dissatisfaction? Besides, one man would fancy that he performed more than his share, while a lazy fellow, a thorough Communist, would be idling away his time, knowing that whether he worked much or little, there was an equal share of the profits for him. I should like very much to see how the advocates of Communism would have affairs managed. I should like an epitome of what they would

consider as proper rules for the guidance of society, if such a state *could* be formed—how every man would be compelled to perform his quota of labour—how the different stations of business and labour could be occupied so as to give satisfaction to all, so that none might fancy his neighbour had easier work than himself. I do not know the full extent the Communists would go to, nor do any of the preceding articles in favour of it give us a full account of its principles. I suppose the first thing on being formed into a Communistic body would be to consider all property as common. As long as there was anything to eat, drink, or wear, we might go on merrily; but when all was gone, what would come next? If one man worked, he would have a feeling of jealousy at others idling away their time and still reaping the same benefit as himself, and this feeling would render all reluctant to labour. A man's labour would not be for his own benefit, but for that of the community. I hope that sufficient has been said to show that the principles of Communism can never be carried out; and that if they could, they would not prove a benefit to mankind.

I will now endeavour to prove "the right which a private individual has to the possession of a part of the earth, debarring some of his fellow-creatures from all interest in such part." In the beginning, we are informed that God gave to *man* "dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth." On this is based the fundamental principle of Communists, that as God gave to *man* dominion over all the earth, the earth and its produce ought to be the common property of all. The doctrine which they would inculcate would have done very well whilst the earth continued bare of inhabitants, when it is reasonable to suppose that all was common amongst them, and that every one took from the public stock to his own use such things as his immediate necessities required. These general notions of property were then sufficient to answer all the purposes of human life; but when mankind increased, it was absolutely necessary to entertain conceptions of more permanent dominion. As human life grew more refined and civilized, numerous conveniences were devised to render it more agreeable. But would a man be

at the trouble to provide any so long as he had only a property in them in common with others—if as soon as he left his tent or pulled off his garment, the next person who passed by would have a right to inhabit the one and to wear the other? Even the brute creation, to whom everything else is in common, maintain a sort of private property in their own domains—the birds of the air have nests, and the beasts of the field caverns, and they deem the invasion of them as flagrant injustice, and will sacrifice their lives to preserve them. The article of food, we should think, would be one of the first objects of consideration; and, therefore, in order to sustain themselves by a less precarious manner than hunting, they would be induced to gather together such animals as were of a tame nature, and thus a permanent property would be established in their flocks and herds. The support of these cattle would naturally make the article of water of great importance; and therefore we read in the book of Genesis of many contentions respecting wells, the exclusive property of which, even in those days, appeared quite naturally (though in opposition to Communistic principles) to have been established in the first digger, even in places where the ground and herbage adjoining remained in common. So we read,* that Abraham, although a stranger and sojourner in the land, asserted his right to a well in the country of Abimelech, because he had digged such well, and was suffered to enjoy it without molestation. This is the first instance I can recollect where private appropriation of what was before in common is suffered, on account of the labour requisite in rendering useful the land so in common. Again, we find that Isaac, about ninety years afterwards, reclaimed his father's property, after much contention with the Philistines, and he was permitted quietly and peacefully to enjoy it, not in *common* with others, but solely to his separate use and benefit.† As the world became more largely populated, it was then made clear that the earth would not produce her fruits in sufficient quantities without the assistance of tillage; but who would be at the labour of tilling it, if the land was the common property of all, and any one might seize upon

* Gen. xxi. 25, 30.

† Gen. xvi. 15, 18.

enjoy the produce of the tiller's labour, and art? Had not, therefore, property been vested in some persons, the world would have continued a forest, and we should have been little better than savages. Society thus begat property, and in order to ensure that property, recourse was taken to civil society, which brought along with it a long train of inseparable consequences, such as states, governments, laws, courts, and the public exercise of duties. Thus connected, it was not a part only of society was sufficient to provide, by their manual labour, for the necessary subsistence of all; and, therefore, opportunities were afforded to others to employ the human mind, to invent useful things, and to lay the foundations of science. Property thus became vested in some persons, and though there is a difference of opinion here, yet all writers agree that title is gained by occupancy that such title was gained. Some writers assert, that title is held by the tacit consent of the community, that the first occupant should be considered as owner; and others maintain that there is no need of their assent, but that the very occupancy being a sign of *bodily labour*, is a *natural justice*, sufficient to gain a title.

I have endeavoured to show, that the earth was originally the common property of all, yet as it was not *primarily* divided, nor did it become so until improved and meliorated by the bodily labour of the occupant, each man, by seizing such property as was most convenient to him, NOT OCCUPIED BY OTHERS, and exerting on it such bodily labour, did give him the best and most reasonable title to an interest in the property therein, and thus, as has been rightly observed, "*Labour constitutes the title to ownership, and is the original property.*"

It has been said by the advocates of Communism on the evils of competition, and in order to beg to subjoin, by way of conclusion, for the especial benefit, a few remarks from a writer, who says:—

"There is a world of thought in this one word (i.e., competition), and there are many things to which we are more indebted to it than to any principle which it expresses. Man is naturally a competing being. He is naturally disposed, not only to imitate his

brother, but to surpass him. There is a progressive element within us all, which, when duly cultivated, leads us to seek after something better than we have yet attained. Even Christ teaches us 'to provoke one another to love and good works,' and he is always pressing on towards perfection. Where there is no competition there is no advancement. Savages and barbarians never bring this principle to bear upon anything but mere feats of physical strength and deeds of cruelty, and, consequently, they remain in the same state from age to age. In China, there is little competition, and mind is stereotyped. The Japanese are now what they were a thousand or two thousand years ago, because nothing new or foreign is admitted among them. In several despotic governments every motive for emulation is taken away, and their caste is perpetual. The nobles are nobles, the priests are priests, and the slaves are slaves, from age to age.

"We are sorry to find that some of the *professed friends of liberty* and of the *working classes*, in our day, are lifting their voices against competition, and condemning it as a most vicious and destructive principle. The idea of revolution and equality is one of the wildest visions that has ever entered the mind of any DREAMING ENTHUSIAST. If all the land and property of the country were *equally divided* to-day, there would be an immense disparity in the circumstances of the population before to-morrow evening, unless those who undertook the matter should also limit the expenditure of every person, by constructing a tariff of household economy, by observing pains and penalties on its non-observance, and ordaining a number of government officials to detect and punish offenders. There must be a financier at every house to inquire how much each individual spends, or else one will lay out, and another will lay up, more than his brother or sister, and the grand *beau ideal* of equality will be infringed on and overthrown. But the institution of such a system of espionage and restraint would *overtop any tyranny* of which we have ever heard or read. The idea which *some* entertain of a nation of *Communists* involves it in the *utmost despotism*. As soon as an *industrious* man obtains a sixpence more than his *lazy* neighbour, he must give it up or have it taken from him, that the indolent miscreant,

who does not like to exert himself, may share a part of it. We have been extremely sorry for some years to find how many individuals of *apparently* philanthropic sentiments have been led away by the delusion, that by restraining persons from obtaining wealth and independency, you would cut up every evil root and branch, and completely provide for the whole population. With morality, liberty, and wealth on their lips, they strive to render virtue impossible, by converting every human being into a machine; to abolish freedom in labour, buying and selling, by transforming every man, woman, and child into a slave; and to banish all prosperity, by reducing each person into a penniless pauper.

"If we allow men and women to be free, there must certainly be competition, *inequality*, and a thousand other differences of opinion, pursuits, and circumstances. England owes her greatness to competition. We have resolved, from a very remote age, not only to raise ourselves, and to rise *above one another*, but also to outdo foreign nations; and here has been one great secret of our progress.

"We are told that many evils have resulted from this spirit of rivalry. So we may say, in reply, many evils very often result from eating and drinking, and therefore appetite is a bad thing; or, that human hands often do much mischief, and therefore we should have been better if we had been born without any. Wicked men abuse everything, and would do far more damage to their species under the system of Communism than it is possible for them to do under this of competition. But the *abuse* of a thing is the very antipodes of its use. There may be an honest, a noble, and a christian rivalry. There is no reason why a man who competes with another should be unjust or oppressive. It is not competition that produces low wages or selfishness. Far from this, we are persuaded that the working classes owe innumerable blessings to this very emulation which some are so seriously condemning."

I now conclude, remarking, that if there is any truth in the assertion, that "Britons never shall be slaves," as a natural consequence, *Communism never shall prevail.*

D. H.

AFFIRMATIVE ARTICLE.—VI.

A FURTHER argument in favour of the ability of Communism to promote human happiness is derivable from the moral benefits it would confer upon individuals and societies. It has been ever the problem of Utopians, from the time of Plato to that of Morelly, "To find a situation in which it should be nearly impossible that man should be depraved or wicked."* This most important of all social problems is, in its generality, satisfactorily solved by Communism. We say, in its generality. It is not to be supposed that by a mere commencement of an outward Communitive constitution of things, that human beings will at once become virtuous or wise, saints or sages: some religious inspirations and moral impulses must always be presupposed. Granted the maximum of these, and we would contend, then, that Communism would be the most consonant sphere for their practical action: and granted the minimum of these,

and we would argue that Communism would be the most perfect school for their development. Compare, in fact, the dangerous positions in which private property places its holders, with the contrary conditions contingent upon a voluntary communion of goods, and you cannot but give the preference to the latter, as a sphere for the evolution and maintenance of virtue, and thus as conferring moral benefits, most highly productive of human happiness.

Let us glance, then, at several instances in illustration of the moral argument against private property, and in favour of Communism. Our first shall be an extreme case.

"The bad Lord Lonsdale," an opponent of the Rockingham administration in George the Third's reign, became Lord Lieutenant of Cumberland and Westmoreland, and possessor of an immense estate. He assumed the savage haughtiness of a feudal chief, and exacted a serf-like submission from his poor and abject dependants. As he passed through Penrith, awe and silence pervaded the inhabitants, and a tremor ran through the

* Morelly's "Code de la Nature," p. 37. Paris. 1790.

town as the gloomy despot traversed its streets. His despotic disposition manifested itself on every occasion. Speaking of Whitehaven, of which borough he was the patron, he said he was in the possession of the land, the fire, and the water—a boast which is thus mentioned in the *Rolliad*:—

"E'en by the elements his power confessed,
 Mines and boroughs Lonsdale stands possessed;
 And one sad servitude alike denotes
 The slave that labours and the slave that votes."

At some periods of his life, even, he resisted the payment of all bills. His lordship either declared that his creditors were knaves, or that he knew nothing about them. In this latter class was the father of William Wordsworth, who died, leaving the poet and four other helpless children. The executors of the will, foreseeing the result of a legal contest with a millionaire, withdrew opposition, trusting to Lord Lonsdale's sense of justice for payment; but they leaned on a broken reed, for the wealthy debtor died and made no sign.*

Here, then, we see private property giving the power to exercise tyranny, to excite fear and selfish submission, and to practise dishonesty with impunity. Here are three of the elements—land, fire, and water—monopolized by private property. How wide the immoral influences thus capable of being realized! How dire thus to the soul, the individual possession of such power, and how heightening its social effects! That the one we have adduced is an extreme case, we fully know; but we contend that it only thus comprises, in an individual instance, the divided details of the immoral influence of private property generally. There are, indeed, thanks to the radical good in human nature, but few Lord Lonsdales. There are, however, many minor men, who, in the aggregate of their characters, compose an extended image of his lordship. Worse still, certain fluctuations of fortune, certain combinations of cent. per cent., may be the hotbeds to raise other individual Lord Lonsdales, while the immoral influences of private property continue in the world.

Mark, however, that we do not assert that private property is the abstract cause of

crime and immorality. These, we deeply feel, have their original seeds in the sinful spirit; but we contend that these seeds are terribly nursed and brought forward under the framework of private property—that there they find nutriment for their monstrous growths and most destructive developments. Common property, although it changed not human nature, would at least cease to afford those easy stimulants and convenient accessories to vice, which a monetary currency now supplies. The lower the nature, indeed, the more prone is it to the sinful temptations connected with private property; but even the higher natures, who have honestly opened their breasts to us, have some time or other during their existence here been subject to the immoral influences of which private property is the bribe and aliment. Heritage and succession, the primary legitimate results of the system of private property, afford us an illustration of this in an instance, from the biography of Cowper, which will speak for itself:—

"Sad thoughts," says his biographer, "were now crowding upon Cowper. He was now in the thirty-second year of his age, his patrimony was well nigh spent, and, to use his own words, there was no appearance that he should ever repair the damage by a fortune of his own getting. He began to be a little apprehensive of approaching want, and under that apprehension, talking one day of his affairs with a friend, he expressed his hope, that if the clerk of the journals of the House of Lords should die, his kinsman, Major Cowper, who had the place at his disposal, would give him the appointment. 'We both agreed,' said he, 'that the business of the place being transacted in private, would exactly suit me; and both expressed an anxious wish for his death, that I might be provided for. Thus did I covet what God had commanded me not to covet, and involved myself in deeper guilt by doing it in the spirit of a murderer. It pleased the Lord,' he concluded, 'to give me my heart's desire, and in it and with it an immediate punishment of my crime.'"^{*}

Of the immoral influences, in the midst of which certain classes exist, through the positions of private property, mark the following four:—

* *Memoirs of M. of Rockingham*, &c., vol. i. pp. 70—72.

* Southey's "Cowper," vol. ii. p. 108.

1st. The position of the lawyer and his client—the interest of the former being in the litigation of the latter.

2nd. The position of the patient and his physician—the interest of the latter being in the ill health of the former.

3rd. The position of the parson and his hearers—the interest of the former being in the sins of the latter.

And 4th. The position of the testator and legatee—the interest of the latter being in the death of the former.

Passing, however, from particular instances, which may be either too much strained, or rendered too elastic, the entire system of private property presents antagonistic aspects to the general development of the highest commandment of the moral law, "Do unto others as you would be done by." The spirit of selfishness incessantly feeds upon it. All its conditions concur in the culture of covetousness and the love of self-aggrandizement. There are glorious exceptions, but these are still exceptions—units amid the mass. As a system, it is one of selfishness and antagonism. Individual is arrayed against individual—family against family. It too often poisons even those relations of family and kinship which should be the most sacred and sympathetic ties of society. Its immoral effects are felt through every fibre of the social body—relaxing the most sacred obligations, severing the most sympathetic ties, loosening the natural bonds of blood, and sapping the very foundations of faith and virtue. Look at the position of the soldier and the trader—the former for money combating to the hilt him by whom he had not been injured; and the latter, buying cheap and selling dear the props of life—the daily bread for which all Christians are taught to pray. Then again, mark the immoral anomaly of the idler surfeiting—the worker starving; the non-producer having the produce—the producer being deprived of it. Indeed the evils of private property are felt most in the moral relations of life. In bankruptcy as well as in success in trade, there exists alike a moral contamination. A successful tradesman, if he thinks morally, must know that success in trade is attended too often by the ruin of unfortunate rivals, and that thus he is working with a system contrary to the highest moral law. Seduction, prostitution! what

shall we say of these? It is not to be said but that cases of pruriency or lust might arise in a contrary state to the present—for generations would be required to allay the present evil development of the passions, but certainly Communism would not furnish these with the terrible abettors and accessories with which they are now supplied by private property. The disgusting marriages of money, and the indelicate purchases of pleasure, would certainly not be there; while here, what soulless seduction, what loathsome prostitution, what suicide, what infanticide! In fine, if we analyze avarice, or misinformed, untutored, barren selfishness, we shall find it at the root of all the vices; and private property is the fosterer of avarice. Love of lucre, and love of lust, are alike avarice. As the apostle Paul tells us, that by the law sin came into the world, so we may say of the present system of private property, that it is the nurse and nourisher of the very sins which it condemns. It is the Mercury of thieves, the tutor of theft; its Jove visits Danae in a golden shower; and without it theft and prostitution, strictly so called, with many other vices, would have no existence.

How immoral, then, is such a system! How sad and sinful must submission to it be, in the eyes of those who have awakened to the consciousness of its immoral influences! How would they joy to exist under a system of a contrary tendency!

This system is that of Communism. Under that system the desire of heritage would no longer poison the fountains of filial love. No Lord Londale would be a tyrant to all around, terrifying even his creditors from a demand for their dues, for fear of further losses from litigation, and seducing a peasant maiden, whom death even could not free from him, as he caused her body to be embalmed, and preserved it in a glass case, as a satisfaction for his solitary selfishness. No poet Cowper, either, weak for the world's work, and possessed of a pining pietism, would wish to step into the shoes of the dead, instead of labouring to mend his own.

Among the moral benefits of Communism may be reckoned the submersion of many sins now connected with the social state, such as theft and forgery—and the submersion of many vices thus connected, such

as seduction and prostitution. All the dishonesties of trade, the antagonistic interests of different individuals in the same department of business, and the doubtful positions of certain classes and professions, in reference to other portions of society, with all their immoral influences, would also thus be submerged.

In the affirmative aspect, the moral benefits of Communism cannot be so confidently registered, as they are largely those of theory. It is thus that we chiefly dwell upon the immoral influences from which it will remove us, as these are known and felt. The very removal of the weeds of vice will surely allow to the plants of virtue greater room for growth. If these have in special instances developed themselves in moral loveliness, even amid the present contrary circumstances and immoral examples of the present social state; surely, in more congenial conditions, with these circumstances and examples removed, they will more generally grow in beauty and grace, flowering on earth and bearing fruit for heaven. Finally, with Communism will come a cessation of those motives of interest and worldly prudence which, for the sake of self-preservation in the present state of things, so often interfere between the kindly wish of the heart and the generous offer of the hand. Mutual service will thus also become of high spiritual significance. All will require to receive, and all will have power to give.

"Silver and gold have I none," said the apostle; "but what I have I will give unto thee. Rise up and walk." Moral elevation is the greatest of earthly gifts. Millionaires after all cannot monopolize generosity. The general education refused in the plethoric city will be freely given in the compact communistery. The immoral influences of private property removed, with institutions congenial with Christianity and virtue, Communism would, I believe, gradually elevate all its participants, and being voluntarily and pacifically established, in faith and love, be moral in itself and moral in its means, affording a sphere of society the most removed from immoral influence, and the most consonant with moral development.

In conclusion, then, as morality is to the actions that which religion is to the sentiments—the will of God and the duty of man; and as human happiness depends upon the harmony of creature with creature, and of creatures with their Creator; and as Communism in its contrast with private property would remove from present society its most immoral influences, and thus form a sphere superiorly suited for moral development; would we further advocate Communism as promotive of the happiness of man. The best of men in the present state have deplored the immoral influences in which they have been placed. The worst in Communism might rejoice in better advantages than the best have here. G. B.

NEGATIVE REPLY.

"You, like all mankind, have had dim inspirations, confused yearnings, after your future destiny; and, like all the world from the beginning, you have tried to realize, by self-willed methods of your own, what you can only do by God's inspiration, by God's method. Like the builders of Babel in old time, you have said, 'Go to, let us build us a city and a tower, whose top may reach unto heaven!'—and God has confounded you, as he did them. By mistrust, division, passion, and folly, you are scattered abroad."—*Edmond, in "Alton Locke."*

Our first duty, as one of the openers of this debate, is to acknowledge the amount of learning and ability which our subsequent writers have brought to bear upon the question. It is true, after all which has been said, that we see no cause to alter our original views. Communism still seems to us like a fair flower in the bud, but with a canker

deeply imbedded in its heart; and Communistic bliss appears that which, should it ever be sought after, will never be attained. We are, however, pleased to see so much ability, although it be arrayed against us; and we now proceed briefly to notice the several writers, and the arguments they have adduced.

The affirmative writers range under the respective signatures of U. M.; L. J.; "Homo"; J. F.; and G. B. In the last initials, and also in the style of the paper contributed, we recognise a writer of eminence in Communistic matters—one whom we have met with pleasure elsewhere, and who, if any one can, is capable of showing us the best side of Communism. We shall notice his arguments in their turn.

U. M. furnishes some strong arguments in support of the principle of common property in the soil, and in inventions and discoveries; and further enjoins the principle that all men should labour. We shall not here stop to dispute any of these points, inasmuch as they appear to us to fall wide of the mark. It was not the object of the present inquiry to determine how far Communism *might* be desirable, or even just, but whether the system itself would really conduce to man's happiness. We see no real argument in the paper under consideration reaching this point.

The next affirmative writer is L. I. His object is to show, both on scripture and historic authority, that the *theory* of Communism is sound, and that to some extent it has succeeded in practice. He cites in support of the first allegation the *belief* that the apostles were Communists, "and exemplified their sentiments by forming the first christian church into a community;" and in support of the practicability of the system, adduces several authorities, laying most stress upon the partial success of the Moravians. If this writer refers to our opening paper, he will observe that we made special exception to persons "imbued with a high sense of moral and religious rectitude." Such persons would be comparatively happy under *any* circumstances: but as they unfortunately form only a small proportion of the human family, we must look a little beyond them—they have the least need to resort to new remedies. The Moravians and all others who have at all succeeded in the practical application of Communism, have been first and chiefly actuated by religious zeal; and Communism has only been made subservient to this end. The fact that the *idea* of Communistic happiness has long been *entertained*, is no proof that its application would be successful. The alchemists long entertained the idea of the possibility of transmuting the baser metals into gold, but we do not find it authentically recorded that they ever succeeded in so doing.

"Homo," on the same side, presents us with a truly doleful picture of our social position as a great nation. We wish, for our country's sake, that we could at once deny much that he has asserted. But the simple fact that our present condition is bad, is no proof that Communism would

make it better. We must see how the remedy is to be administered. "Homo's" definition of the principle of Communism, which seems to us about correct, is that it "seeks to restore the primal rights of mankind, by abrogating all claims to the possession of *private property*; and to secure the equal rights of all men to develop their *unequal* faculties, by establishing a community of goods and a concerted combination of effort among all classes of society." The real point, then, is to see how far the carrying out this principle would be likely to secure the end in view—namely, the promotion of man's happiness.

Now, we are prepared to assert our full belief that the chief sources of man's happiness (leaving out that resulting purely from religion, and which cannot therefore be affected by any earthly considerations) may be traced as originating either in the acquirement, by one's own exertions, and in a fair and honourable manner, of a comfortable competence for the support of ourselves and those dependent upon us; or, failing to secure such competence, still having the inward satisfaction of having led a good moral life—of having, to the best of our ability, and by the cultivation of our best faculties, contributed to the comfort and happiness of our fellow-creatures;—in word, having done all that our position in life enabled us to do towards leaving the world better than we found it. The satisfaction, we say, of having well acquitted ourselves in these particulars constitute real happiness, and at the same time tend to rear up within us that true nobleness of nature which ever has and ever will constitute the real and unmistakable distinction between *really civilized* and *moralized* being and those who are not so.

Well, how does this bear upon the question before us? We shall see. It is truly and wisely said that SELF is referred to in the *first* law of nature. It might be well were it not so, but the fact we cannot alter. Where our own interests are concerned, where our own fame may become extended, or our own honour advanced, there we are ever active, energetic, and determined. Where only the interests of others are involved, or our own but very remotely, there we are apt to exhibit sloth, neglect, and indifference. When, mainpring, self-interest, being absent,

whole machinery stands still. If this be man's nature, how are we to hope for any universal departure from it? A few conventional minds may for a time suppress their individuality, and amalgamate into a union of brotherhood. Their religious or moral qualifications may enable them to do so; but how will the principle apply to mankind generally? for this is the point to be thought of. It is not sufficient that many, or even the majority, are content to doff their individuality, and surrender their self-interest to the common good. Upon the simple yet obvious principle, that

"One sickly sheep infects the flock,
And poisons all the rest,"

the few dissentient or non-conforming individuals, would most effectually mar the perfection of the whole plan, by undermining the basis on which alone the structure could be upheld—namely, the constant unanimity of every member interested. We see then, at a single glance, that the principle embodied in, and being indeed the very basis of, Communism—the forfeiture of self-interest, self-accumulation, self-distinction—is contrary to the *natural* impulse and desires of mankind, and hence we discover the cause of the limited progression which Communism has hitherto made, and to which we doubt it must submit to make in future.

To say that we arrive at this conclusion without some feeling of regret, would be to belie our own conscience. We have a sympathy with all projects for the amelioration of human misery, or in other words, the promotion of man's happiness. They all perform a great good, by directing public and individual attention to the points they aim at. The world is, no doubt, indebted to the dreamings of the Communists for many of the social improvements which have already taken place. We wish, for the world's sake, their theories were more suited to practice. We eagerly seize upon every new Communistic proposition, with the hope of finding something *REAL*. We therefore entered upon a discussion of the question in these pages with every desire to do the subject justice; and although we have very freely expressed our views, we hope, whenever Communism shows itself equal to its aims, we may be permitted to join the ranks of its supporters.

We are drawing speedily to a close, but

we should be guilty of an act of injustice to pass unnoticed the learned arguments of G. B., in recent numbers. We agree with his first proposition, that "the ability of Communism to promote the happiness of man is not necessarily connected with the question of the abstract right or wrong of private property," but that it has rather to do with "the ability of *common property* to promote human happiness." The point of our argument has been to show that the principle of common property is antagonistic to man's happiness: because that happiness, as we have shown, seems to arise either from the success of individual exertions, or an inward consciousness of having individually, *and of our own free will*, endeavoured to serve the great cause of human progression. Therefore, if by adopting the principle of common property you discourage or altogether banish the inducement to individual exertion, from which happiness proceeds, the result *must be* just the opposite of that held forth by the Communists. Such, at least, is our own belief.

Most of us will also agree with G. B. in the high estimate he forms of the beauties and advantages of the religion of Jesus, but we may pause with advantage before we are drawn into an admission of the truth of the proposition so ingeniously interwoven into this part of the argument. We mean, that Communism tends naturally and almost necessarily, to direct our minds to think upon, and our hearts to adopt, this "pure and undefiled" religion. We have already endeavoured to show, that where religion has had to do with Communism it has taken the initiative, and has *not* been the consequence of Communism. Certainly, even in the present day, we have had instances of the attempt to make religion subservient to the practice of Communism, of a certain class. We have cause to rejoice that the attempt has proved a failure. Communism to be successful must be *religious*, pure in principle, holy in practice. Then we revert to our first argument, that the religious element alone would be that around which the happiness would irradiate—in which it would concentrate.

We know G. B. will forgive us for believing that he rather writes of Communism as he wishes it to be, than as we have *real* grounds to believe it *would be*.

How much still remains unsaid ! Yet we must conclude, and we would do so with an extract from the beautiful prayer of the saints, in *Festus* :—

“ May all who dwell
On the open earth, or in the hid abyss,
Howe'er they sin or suffer, in the end
Receive
The Mercy that is mightier than all ill.
May all souls love each other in all worlds
And all conditions of existence :
And knowing others' nature and their own,

Live in serene delight, content with good,
Yet earnest for the last and best degree.

• • • • • May kindness and truth,
Wisdom and knowledge, liberty and power,
Virtue and holiness, o'erspread all orbs.

• • • • • The world be bliss and love,
And heaven alone be all things ; till at last
The music from all souls redeemed shall rise,
Like a perpetual fountain of pure sound,
Upspringing, sparkling in the silvery blue—
From round creation, to thy feet, O God ! ”

AFFIRMATIVE REPLY.

In the article which I wrote at the opening of this discussion, I attempted to show that the earth and all that it produces ought to be recognised as the common property of man. In support of this view I stated that the earth has an intrinsic value, which has been stamped upon it by the Creator, and that this value was designed for the use of the human family : and hence that any rental which is charged upon this value, is a fraud which is practised upon that part of the community who have to pay it.

It has been intimated, however, that this charge is not made upon the original value of the land, but upon the labour that has been expended upon it : and F. F. supplies us with a very interesting picture of a man who, being wrecked upon an island, sets about to enclose and cultivate a portion of the soil, and eventually leaves the fruit of his labours to be enjoyed by his son. We say it is an *interesting* picture : as it regards the mass of landed property which is held in the world, it is, unfortunately, a *fictitious* picture : for this is not the way in which the soil has become the property of those who hold it.

The rental which is charged upon the soil does not necessarily represent the labour which has been bestowed upon it.

How much labour has been expended upon the forest land which to this moment exists in some parts of our country ; land which to all appearance is as wild as that of any uninhabited country can well be supposed to be, and yet for this soil tenants who occupy neighbouring farms are called upon to pay rent. It will perhaps be said that if labour has not actually been expended upon the soil, roads have been formed in its neighbourhood, and are from time to time kept in order, and so the land has been improved in

its position. To this we reply, that as the land is extra-parochial, if roads have been formed, it has not been at the expense of its proprietors, and hence a charge of rental on the ground of such accommodation is a charge upon other people's capital, which is notoriously unjust. But the lords of the soil would not acknowledge the rental of such land to be a charge on the labour and capital of others : it must therefore be a charge on the *intrinsic value* of the soil.

But this doctrine of the right of occupancy is a farce. Take the case of our own country. Suppose we have a proprietor who holds ninety or a hundred thousand acres by inheritance in a direct line from the time of the Conqueror. Whose land was it before that period ? How did the present proprietor acquire his right ? From the original right of occupancy ? Certainly not—but from the sword. His land was by the right of occupancy the property of the Saxon who held it before him ; and this Saxon had in his turn taken it from the Briton, who in his day possessed a similar right.

Now the question naturally presents itself, Which of these rights of occupancy is the proper right ? It may be said, The original one. But who knows which is it ? and if we were in possession of this information, where should we look for the proper inheritor ? By rendering the land common property, Communism avoids this dilemma, for it gives the *heir*, if living, a right among the rest.

But there is some little ambiguity about this term *occupancy*. It may mean as much as a man is able to cultivate with his own hands, or it may mean as much as he is able to appropriate to his own use. If the former be intended, it would certainly take a long time yet to occupy the globe ; but if the

d men who appropriate land by tens and of acres be recognised as occupiers it is not quite certain whether the land is not already occupied. It would require some discernment to distinguish between the right of the lord who owns a portion of his land, which he preserves, and that of the Indian who has a right over a part of an island or continent which he designates his hunting-ground.

objects to Communism on the ground that it would prove a barrier to all progress, by removing the great incentive to labour, the accumulation of property; "Would society support the astronomer, the traveller, the mechanist, in return for the discovery of a new world, or the discovery of a new piece of machinery?"

the first part of our friend's objection does not acknowledge the premises. The accumulation of property is *the incentive to labour*. That it is *an incentive* we do not deny; but there are at present incentives which take the lead of the love of power and the love of fame. *cases* the accumulation of property is an incentive simply because it *leads* to power and fame. Now in a Communistic state there are no positions of power, and the fact of there being such positions would itself be a sufficient stimulus to the accumulation of property inasmuch as these positions would be obtainable without the aid of wealth. *then* as to *fame*. No doubt in a Communistic state great deeds would be recorded and the report of them transmitted to all climes and other generations, and this would still be an incentive to great

deeds. The community would not support the astronomer or the mechanist. Nor would it be useful that it should. As the general principle of labour would be very much curtailed, extending beyond some four or five hours per day, after which persons would be at liberty to employ themselves according to their tastes.

The traveller would be sure to be benefited; the desire to extend the blessings of Communism to other lands and people, and to introduce, from time to time, such

improvements as would be calculated to benefit the community, would ensure this. He would not, indeed, as now, travel for mere personal pleasure, or perhaps scientific purposes; but as the missionary of the community he would make known to those who are without the blessings of Communism, the advantages which would accrue from their adopting the Communistic state.

Another objection is that men will not be *equally* capable of benefiting the community, and hence jealousies will arise.

Can any fact tend to prove the expediency of the Communistic state more than this—that all men are not equally fitted to benefit the community? All are not fitted to be *heads*; some are suited for hands, some for feet; some for one place, some for another. Labour, in order to be well done, and done to advantage, must be divided. Each man must occupy his proper position. Well, one of the advantages of Communism will be that it will furnish each with his own proper work. Instead of a man having to feel his way, as now, through a long lifetime before he finds his place, and then dying before his work is done, his education will be carefully watched from early youth, the particular tendency of his mind marked, and before he arrives at manhood he will have been suitably trained for that occupation in which he is to spend the prime of his life.

But our friend thinks it horrible that the community should have the education of the young intrusted to its charge, and that this necessarily implies a severance of those ties of affection which ought to subsist between parent and child. We do not sympathize with him, for we do not think that such need to be the case. The position of such a child would certainly not be worse in this respect than that of the naval or military officer, who at a tender age is taken to a government school. Do children, under such circumstances, forget their parents? or do parents cease to remember their children? Surely the circumstance of children being properly educated will in no wise tend to lessen their affection for those who gave them being, while it must render every succeeding generation more advanced, and thus, as one of the results of Communism, promote the happiness of man.

POETIC CRITIQUE.

Speech is silver, but silence is gold.—CARLYLE.

THE office of the poet announces itself, with clear and well-defined utterance, as unmistakably the same in all ages. The vehicle of his revelations may be somewhat different, but the divine truth which he utters is the same—to lead man to look upon the beautiful as the only true and divine side of life, and to learn that only the true is beautiful. He it is who shows us there are no brass walls between the immortal spirit of man and its divine Originator; that the spiritual side of our nature should continually sun itself in the smiles of God; that the hallowed precincts of the human soul should not rudely be invaded by any listless vagrant, who knoweth not that the footsteps of Deity are heard, clear and distinct, in the secret chambers of that spirit.

The poet is a man of all times. He is never out of place. His mission is never doubtful. He knows the spiritual wants of his age, and to him is given the power to satisfy the craving of a nation after truth. He, of all men else, is the favoured of the gods. His feet are resting on the earth, while deep clouds are round his head—his full glory veiled from the eyes of grosser men. His spirit dwells in a land where a "spring eternal makes glad the garden of the heart"—where he drinks deep at the fount of light and joy. Amid the crumbling walls of Time no step is heard more firm than his. And, round about him, in fancy may we often hear a chorus of spirits, to whom he first gave breath, rising in low, murmuring strains like the swelling surge of a distant sea, or the shrill warbling heard by the dying musician—like a whisper of hope from the silver clouds above.

The same innate perception, the same spiritual necessity, which causes the musician to pour forth his soul in harmonious strains, as though the very stars were moving "to the concourse of sweet sounds," also dictates to the poet the utterance of his holy thoughts.

Yet there is another perception, of a somewhat lower kind, distinguished alike by these two men, namely, that law and order are beautiful even in simple things. The best truths should be uttered in the best way; the sweetest strains conveyed in a manner pleasing to all. Hence the one has his verses, the other his stave, with its adjuncts. These are his servants, not his masters. These are what we may call the mechanics of poetry and of music, and, of course, are the most easily reproduced. But what is a combination of cogs, governors, and spindles, without the motive power—the vital force that moves the whole?

The ease with which this mechanism is imitated, has brought into existence another class of writers, generally designated poets, but—! This last class, which will be more properly styled verse-makers than poets, certainly, to an extent, fulfils its mission. Some there are who serve to while away an hour pleasantly enough; some appeal to our better feelings with that directness of purpose which shows a spark of the true man. *But the danger of this heterogeneous plant is, that*

it so often runs to seed, and becomes husky. Musical numbers are pleasant, so there be some meaning in their music, and not a mere jingle. But, as we have said, after all "they are but the faintest echo of poetry," which is—

"An endless fountain of immortal drink,
Pouring unto us from the heaven's brink."

Yet, with all our astrigent remarks, there is, now and then, a versifier who, as he "babbles o' green fields," does win from us a fair portion of love. He who would lull an unquiet soul to rest, and, while he soothes, strives to elevate the fainting spirit, and gently rouse it to action and noble duty-doing, shall not pass unhonoured.

What is sweeter or more entrancing to a real quiet, yet hearty, spirit, than to seize a volume of ballad-poetry, and ramble forth into the woods and fields, and there, lying beneath a glorious canopy of green leaves, with here and there a glimpse of the bright blue sky above, drink deep

"Of teeming sweets, enkindling sacred fire"?

Perhaps no age was ever so distinguished for its writing propensities as the present, yet it is not a complete dearth, else it would be weary indeed. The names of Bayley, Tennyson, Browning, Longfellow, and a host of others, are too well known for that. The only objection is, that every tyro imagines it is not enough to write, but he must *print*, his effusions, thus besetting, like a bevy of importunate beggars, poor, wayfaring men, who have none too much time, nor too little to do in it.

And now, having said thus much of poets and poetasters, we turn to our own Parnassian friends, to see what mole-hills or what mounts they have perched themselves upon. Some, we imagine, will find themselves upon sand, ere long, and that every breath of wind that passes will carry away a portion of their pedestals to mingle with the common stock of puerilities and grains of nothingness.

First in order comes "The Stars," by "Condiscipulus." This piece, our readers will remember, was printed in conjunction with "Poetic Critique, No. II.," vol. ii. page 471; but owing to unforeseen circumstances, our remarks thereon were entirely omitted, thus giving "Condiscipulus" reason to believe we had dealt with him somewhat summarily. We read the lines with some degree of interest, as they were decidedly the best we had received. One faulty phrase there is, namely, "sunless suns;" there is too much of the *s*, which is, at the best of times, not a most delightful sound. There is an interest in the stars which has been felt in all ages; there is a brightness in the very memory of a starry night. So magical is the influence which they have exercised, that men have imagined them linked up with our very destiny. How calm and holy is the pure light shed from their lustrous eyes of love! What thoughts of other lands and other worlds do they bring with their cheering smiles! What promises of rest for the weary!

as! thou bringest all good things—
weary, to the hungry cheer;
bird the parent's brooding wings,
stall to the overlaboured steer.
peace about our hearthstone clings,
household gods protect of dear,
round us by thy look of rest;
at the child, too, to the mother's

nded of the stars, is to be carried
tion, to the woods and fields, there
nce and awe, on the "beautiful
e of night."

murky walls of a city for the pure
the "vaulted blue," can only be
ed by those who have a love for
the bright and happy stars look
their lustre, on the earth beneath,
ek some fallen spirit to the skies.
those silent monitors, those spirit-
a pure and holy religion, seem to
ze! How kindly do they smile
above! Can we blame the child
ider and adoration, believes them
f angels, looking through the floor
ield his lowly couch from harm?
isions of the night—the dreams!
what strength to resist temptation
a visions of a brighter land,

green turf hides no grave,"
ered in the night, from the sweet
uce of the stars?

ill, even after the lapse of ages of
hat are those radiant inhabitants
or what end created? have they
beginning of Time? Will those
of glory, which light up the ever-
of the universe—the temple of
b—ever be extinguished, leaving
Will the "star-dust of God's feet"
in those fields of ether throughout
ages that have yet to roll? Will
to sound their celestial songs—
they be by the ear of mortals—
ave of time shall have broken on
mity?" Yes, we believe they will
tinue to "bathe in rosy light" the
s and of angels, where—

"Lowly reverent,
r throne they bow; and, to the
location, down they cast
swove with amaranth and gold.
anth! a flower which once
it by the tree of life,
s; but soon, for man's offence,
moved, where first it grew, there

oft, shaling the fount of life,
river of bliss thro' midst of heaven,
ism flowers her amber stream;
t never fade, the spirits elect
splendent locks entwreathed with

urlands thick thrown off, the bright
like a sea of jasper shone,
s celestial roses, smiled."

hyme is of "Summer Evening
minely an enchanting title, and
ritten; it brings back remem-

brances of the sunny hours of youth, when we
rambled amid the green pastures, makes us wan-
der again beside clear streams and shady groves,
where we sit in silence and in solitude, to listen
to the twittering of the birds, the busy hum of
insects, who sport away their lives—a summer's
day—in one continual buzz and murmur of
delight; we watch the clear rivulet as it ripples
musically along over the stony bed

"Which ruffles the wave, but sweetens it too;"
or, perhaps, again turn children, and gather the
wild flowers that enamel the green carpet which
we tread; or wander on to the lone wood which

"Overshadoweth
Eternal whispers, glooms, the birth, life, death,
Of unseen flowers in heavy peacefulness."

The lines, of which we give the first verse, are,
as we said, tolerably written; yet, on the whole,
there is a barrenness of idea, as is evidenced in
the fact of so much being said of the rays of the
sun:—

"Sweet is the hour of eve! How fair the scene
Nature reveals! How beautiful the west
Glow in the sunshine's mellow beam,
Ere, for the night, he calmly sinks to rest.
His farewell glance—his last bright parting ray—
Illumining the azure arch of heaven,
Far fairer than at full meridian day
His beams—though then in powerful splendour
given."

"Lines to Young England," "from an Ardent
and Outbursting Spirit of Twenty," show the pos-
sibility of improvement. There is truly evidence
of an ardent spirit; yet we would warn the writer
not to let it degenerate into mere bombast. Re-
member, it is the shallow brook which makes the
greatest babble. Has "Henricus" ever read
Kant's Poems?

With regard to the subject-matter of the "Lines
to Young England," we cannot subscribe to the
notions there expressed. For instance, speaking
of Greece, Rome, Persia, &c., he says:—

"Their sun derived its source and light below
[from below],
Ours from the Sun of Righteousness above;
Their pole-star, war, ambitious or [and] unjust,
Our pole-star, justice, honour, love of truth." (?)

Indeed! And thus, in the space of four lines,
does "Henricus," in his own mind, eclipse the sun
of Greece, Rome, and Persia. We would remind
him that he must know very little of history,
either ancient or modern—nay, even the events
of to-day—to draw such a conclusion, especially
as he says "Greece and Rome's grand monu-
ments decayed." Has he ever been to the British
Museum? Has he ever noticed how, in all quar-
ters of the earth, copies even, where originals
cannot be procured, of all that Greece and Rome
ever produced, are eagerly sought after, as though
they were pure virgin gold? Has H. ever read
Plato? has he read Homer?—works which will
yet outlast the flood of literature—England's
"mental monuments." And is it thus that these
grand phases of humanity are to be blotted out
for ever? Oh, no! The spirit of the beautiful
never was more grandly expressed than in ancient
Greece. Believe us, her memory will never know
decay.

And is it true that her light was derived from

below, while ours is derived from above? The very thought is sacrilege. To compare a nation whose only god is now gold—whose very doctrines of exchange are, Let the body live, though the soul perish:—is it not an acknowledged principle of English trade that every man must beat his neighbour out of the market if he is to get rich? for that is now the grand desire. When was there an age when people were so infatuated as at present? Gold! gold! at whatever cost. And is this *yellow*, feverish glitter the light derived from the Sun of Righteousness? And have our wars been so honourable? What, for instance, was the cause of the Chinese war? Was "justice, honour," or "love of truth," the pole-star of England then? If so, what was the meaning of the "*Opium Trade*"? Has the late war at the Cape been particularly distinguished for humanity? Shame! "*Henricus*," to strive, for the sake of rhyme, thus to ignore the memory of a noble people, whose

"Souls of the lofty, whose *wandying* names,
Rouse the young bosom still to noblest aims."

We trust H. will, ere long, think otherwise of this land of heroes and of gods. We wish not to underrate the glory of England. It is great truly, and we love her as our mother earth; but we cannot hear her noble predecessor, the very morning star of civilization, thus lightly spoken of.

The "*Dream of Words*," by P. D., we do not much admire. There is a hazy indistinctness about it—we had almost said a fog. The drift of the piece seems to be, that we should be careful what words we utter, as they will appear against us at the last day in brighter colours than we may imagine. However, the idea is not well wrought up. The "*dream of words*" has become a *wordy dream*. We would recommend to the notice of P. D. the words of a celebrated poet, of which we give a *free* translation:—

"He who strives to rise too far,
May bump his head against a star."*

The "*Night-Wind's Lesson*" is better. However, "*Songs of Heaven*" is decidedly the best, though the reading of the first part of it was somewhat painful, on account of the inconveniently small hand in which it was written. We would give this as a warning to our "*Poetic Friends*," at least,—to let their *honied* ink be spread out in fair proportions. We give two verses of "*Songs of Heaven*:"

"The *cloudy mists* around thy throne,
Trail their garments dim;
And the blue ether's springing dome
Is made by Deity a home
In which we worship him"

"I heard the *trailing garments of the night*" is by Longfellow: we will not say P. D. has seen it; yet we *do think* he has seen Goethe's "*Faust*," from other sentences in his verses.

"The vaulted aisles of the airy sky
Echo adoring love;
We wait the word through space to fly,
And we live on the breath of Deity,
While the *Sanctus* rings above."

* "Quod si me lyricus vatibus inseris,
Sublimé feriam sidera versice."
Per: aps P. D. will take this into consideration.

P. D. has some good thoughts now and then; but they require greater care in giving them expression. We should like to see another attempt, written with greater care, both from P. D. and the writer of "*Summer Evening Thoughts*;" there is possibility of improvement.

Next comes our friend of "*Old Scot/And*" again, with his lines "*To Miss —*". Reader, would you like to know her name? He calls her "*Isa dear*" in the last verse, which we cannot do better than paraphrase to J. C. himself, thus:—

But *I say* (*Isa*), dear, now, don't you think,
(To be plain without disguise.)
That you some common sense could write,
And cease to poetize?

If it would be saying much to J. C., or give him an hour of sweeter sleep, we may say we prefer "*Isa dear*," as being a little more graceful than "*Victoria*," though—(our lady readers will please place their crochet-needle over the next sentence)—neither of the ladies are "any better than they should be."

Lines "*On an Apple*" we do not like at all. The philosophy is decidedly bad. E. A. S. calls the apple deceitful—seeks to place the blush upon it for the sin of Eve—and straightway he would leave off eating apples (!).

"And when an apple meets my eye,
A voice says, 'Eat not! lest ye die.'"

"Ye gods and little fishes!" what want of *taste*? "Eat not"!! When an apple meets our eye, rosy, streaked, or beautifully plump, a voice cries, Eat! eat! and we obey that voice forthwith, so that "the apple of our eye" becomes at once "the apple of our palate;" and we find, that which in the "mouth was sweet," "in the belly is" not "bitter." E. A. S. gives us another piece without a title, though we should suppose it is "*Hope*":—

'Let sorrowing hearts bear this motto in mind—
A life without hope is a world without sun,' &c.
The construction of this piece is decidedly bad; the sentiment we can agree with.

"Last, though not least"—that is, in length—is a "*Song to the Lark*." We would certainly give our readers a treat by publishing the whole of the "*Lark*," but he has such a *tail*—only twenty-five verses!

Ver. 1. "Oh, my companion, thou
Bird of sublimest wing,
Together let us now
Communicably sing."

Good! That word, "*communicably*" is exceedingly fine. E. D. *scapt* before, with a beech tree

Ver. 2. "Of Empyréan height
Thy song does all inspire;
And mine is the *twilight*
Of glimmering desire."

We should suppose, at any rate, the *candle* was out with our singer, and he was "left darkling."

Ver. 3. "With yearnings to *ascend*,
I spend my *flickering flame*;
And my *lax wings* dissend
Unrising. They are lame."(!)

Yes, our "*glimmering*" friend has again "spent" his metal to its utmost length—"spent" his

"flickering flame," and his "lax wings dissend
 arising;" dipped in treacle, perhaps. "They are
 lame." So is his verse. Poor Pegasus! "Drop
 a tear; ay, drop another."

Ver. 6. (Patience, gentle reader, only twenty-
 five, remember!)

"I am a worm, O bird,
 A grovelling worm but here (*hear!*)
 Wherever I have heard
 Thy music I reverse."

We should think the bird had no *bill* when E. D.
 said he was a worm (which nobody doubts), or
 his account would have been settled immediately.

Ver. 8. "I crawl about a space—
 A little space below—
 (Only twenty-five verses!)
 Though wishful oft to race
 With the swift-footed roe."

E. D. is too heavy for such gymnastic exercises
 as flying and racing.

Ver. 12. "Into the vault of heaven
 Thou dost high-minded (*bodied!*) go,
 With due attention given
 To humbler *thought* below."

Ver. 13. "Thou dost *descend* again—
 Again *ascending up*—(yes, up again!)
 As my poor thoughts which wave
 Betwixt despair and hope."

Ver. 14. "Perhaps thy theme is not
 Of heavenly things alway;
 Or, as poor Hogg (*bruin*) has *thought*,
 Thou sometime tun'st thy lay."

Ver. 17. (Only half this time.)
 "Let us sing merrily
 Our love songs without end."

We would advise E. D. never to sing or weep any
 more, though he says, "I did consider myself
 rather watery-headed." Well, never mind; so was

the "beech tree which dropped in a leaf." There
 is sympathy in companionship.

Ver. 18. "For I *descend* as thou—(down again!)
 To seek rewarding love—(a whipping!)
 From kindred souls below—(the cook!)
 Who shall my songs approve."

Bless her taste! We'd rather suffer any amount
 of grinding from a barrel organ.

Ver. 21. "If none shall say 'tis good—(what say
 our readers?)
 If none shall *smile* assent—(it makes us grin!)
 Then be my fairest flood
 Of verse for ever spent."

So say we—he will *spend*, this time, to advantage.
 "Flickering flame" extinguished—"Metal spun
 its utmost length"—"Flood of verse for ever
 spent."

"Fare thee well, and if for ever—
 Still for ever"—

Stop! here's another verse. Yes, just this one. It
 is the last feather in the *tail*; yes, the twenty-
 fifth:—

"By the sweet soul of song
 Which doth inspire my heart—(nonsense!)
 But I will not prolong
 This lay. Sweet bird, we part."

Surely our readers must have revelled in the
 delights of the muse. Surely no bird ever sang
 so sweetly before. He deserves a *cage*; his *perch*
 he has already found. "*Water*" he professes to
 have plenty of; *seeds* he has none—at least of
 genius, or even talent in verse making; feathers
 he has some few (which we hope will not be
 ruffled), though he has no wings. All we have
 left to say to our unfledged songster is—

"Sweet bird, we part."

E. B.

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Chesham Mutual Improvement Society.—
 This society held its first half yearly meeting on
 Tuesday, May 18th, when about 100 members
 and friends were present and partook of tea, after
 which a meeting was held, the Rev. W. G. Lewis
 presiding. The secretary (Mr. H. W. Lusty) read
 the report, which stated that the usual difficulties
 presenting themselves in the formation of such
 societies had been most successfully overcome,
 and the committee congratulated the members on
 the prosperity which had attended their exertions.
 During the half year discussions had taken place
 on important topics, such as the following:—
 "Has Government any Right to Interfere in
 Education?" "Is War, under any Circum-
 stances, Justifiable?" with many others equally
 important. Lectures had been delivered on
 various interesting subjects, and a library for cir-
 culation had been established for the use of the
 members. After calling upon the members to
 renew their exertions for the society's good, the
 committee concluded their report, expressing the
 hope that the Divine blessing might attend and
 prosper the society. Interesting and able speeches
 were made by the following members on reso-

lutions prepared by the committee:—Messrs.
 McMichael, C. Channon, Baker, Keen, Hewson,
 D. Channon, Steel, and Pye.

Mr. Moore addressed the meeting in a very
 able manner, showing the advantages of the age
 in which we live over all preceding ones, and
 pointing out the causes we have for thankfulness.

Mr. Lang offered some very practical remarks,
 showing the necessity of making reason in some
 cases subject to revelation.

The chairman then delivered an excellent
 address, in which he censured those persons who
 seem to believe that all the educational and
 scientific wonders, &c., of the present day are to
 be wholly ascribed to the superior wisdom of the
 present generation, instead of only looking upon
 them as improvements upon the plans of our
 forefathers, the benefit of whose experience and
 counsel we enjoy. He warmly congratulated the
 society on the success which had attended it, and
 assured the members of his constant sympathy
 and support.

After a vote of thanks to the chairman the
 company separated, highly delighted with the
 proceedings of the evening.—H. L.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

106. I was told in conversation the other day, that Monmouthshire is not in Wales. My informant gave me to understand that it used to be, but, by an agreement made many years ago, once every century a county passes from Wales to England, and ceases to be considered a portion of Wales, Monmouthshire being the last that underwent this change. If any of your correspondents can solve this mystery, and give me the particulars of the agreement (if such there be), they will confer a great favour upon—H. P.

107. Being desirous of studying the French language, and my means being rather limited, I shall feel greatly obliged if any of your contributors will kindly give me information as to the best and cheapest books for self-instruction in that language. A reply in "The Inquirer" will oblige. D. J.

108. "Armand," who is anxious to study the German language, would be extremely obliged to any of your numerous readers who would furnish him with an account of the methods severally introduced by Robertson, Lebach, and Ollendorf, and any critical remarks thereon.

109. A. Z. has a friend, a farmer, in whose farmyard is a pump for procuring water for the cattle. Can any of your numerous correspondents account for the fact that the water which flows from it becomes warmer at every stroke of the handle?

110. Some years ago I met with an anecdote of the late Daniel O'Connell, M.P., to the following effect:—During a debate in the house, a remark was made by a certain "gallant and honourable member" which called from the "Liberator" an impromptu parody of those celebrated lines of Dryden—

"Three poets in three distant ages born," &c., substituting "colonels" for "poets;" and, in the second line, "counties" for "countries:" if any of your readers would favour me with a complete account of the circumstance, with the whole of the parody, I should be particularly obliged.—IOTA.

111. Should the fact that a father was once afflicted with insanity (though he afterwards entirely recovered) be sufficient reason to deter his son from contracting matrimony?—or would his doing so involve any moral culpability? A reference to any work in which the subject is ably treated would confer an obligation.

ANSWERS TO QUESTIONS.

87. *Literary Eminence—how to attain it.*—The literary character is one of the best and noblest of the present age. To be *the thinker* for the people—to be the prime mover of all great agitations—to be the trusted friend, counsellor, and instructor of the many—to be the tutor of legislators, the critic of princes, the arbiter of the disputes of nations and the leader of public opinion, are attributes which, however glorious and captivating, imply mighty responsibilities. To direct the current of the world's progress—to occupy the mountain-places of thought—to watch the dawn

and advent of new truths and circumstances—to "find the future from the causes which arise in each event"—to study the past, and thence

"To glean
A warning for the future, so that man
May profit by his errors, and derive
Experience from his folly"—

to register immortal thoughts upon the "fleshy tablets" of men's hearts—to point the pathway in which humanity should journey in its search after the *summum bonum*—to arrest and guide the whirlwind passions of the mob, as well as the whimsical eccentricities of the high in place, are undertakings not lightly to be entered on. The thought-king is now the sovereign ruler of the people; to aspire to that monarchy requires careful self-knowledge. The mere possession of an ambition to wear the glory-haloed crown of a nation's gratitude—the mere effervescence of an ardent youthful enthusiasm—the "burning thirst" to benefit one's fellow-men, pure and disinterested as it may be—are not sufficient to support a claim to such a proud pre-eminence. True, there are men who hold no such lofty ideal who labour with the pen—such are not so much literary characters in the genuine, as it is the loftiest sense, of the term as *litterateurs*. But to one who "out of a pure heart fervently" desires to bless and benefit his comrades in life's journey—and such an one we presume T. G. to be—we would humbly advise a calm, serious, and severely-judging self-inquisition regarding his mental and moral capacity to assist in building up the fabric of man's happiness and knowledge—a diligent perusal of the chief thoughts-men of our own country—a critical, analytic study of the style of the chief classic in the English language—a steady, persevering course of training in composition after those models which approved themselves most to his own mind in the logic of the inductive science and the elucidation of metaphysical truths. This course of study would be largely aided by the reading of Hallam's "Literature of Europe," the constant use of Webster's Dictionary, Smith's Dictionaries of Ancient Geography, Antiquities, Biography, and Mythology, McCulloch's "Dictionary of Commerce," Murray's "Encyclopedia of Geography," and a good Encyclopedia. The acquisition of a knowledge of synonyms and pseudo-synonyms, paronymous and conjugate terms, &c., would be beneficial. From what we have said above, T. G. will perceive that we have virtually given an answer in the negative to the query regarding the *classical and foreign languages*. Our reason is simply this:—Society, intellectually speaking, may be, in a general point of view, divided into three classes—1st. The high classes, who receive an education comprising the languages mentioned, who use one or other of them as a medium of familiar intercourse, and who are capable, in consequence, of receiving enjoyment from a style largely interfused with such terms. 2nd. The middle classes, who, although they receive a learned education, from circumstances of station are more frequently brought into contact with those who employ

vernacular, and are consequently more aptly used in it than any other form of speech. 3rd. The lower classes, who receive no education except in the mother tongue, whose philosophy and associations are made up of homely joys, "wise saws and modern instances." It is obvious, therefore, that an accurate knowledge of the proper use of the vernacular affords sufficiently wide scope for the exercise of a great and glorious dominion to any one whose sceptre is a pen, wielded by an honest and sincere heart, and an intellect full of lofty thoughts.—PHILOMATHOS.

8. To the query put by T. G. we are inclined to give as an answer a conditional negative. There can be no doubt but that a knowledge of the classics and foreign languages is a great aid to accuracy in the use of words and copiousness of expression. But the object of the orator, we apprehend, is not to utter recondite truths in unerringly accurate language. His great office is to be the interpreter to the people of those truths which the prophets—if we may so speak—have elaborated and recognized; to feel his heart beat "with a giant's throb" at the occurrence of wrong, and to send forth his voice in defence of right in such a manner as shall "touch and thrill" the hearts of the great mass, and to hasten the dawning of

"The morn of Truth's immortal day."

For this purpose he must make his heart "the home of the great dead and their great thoughts;" though all this lore must be directed to the one great aim, the amelioration of the present and the advancement of the future. To this should all studies be subordinated—all energies bent—all thoughts directed. If our opinion be right, the great object of the orator in using language should be, to make himself understood—to have a style

"Clear as a beautiful transparent skin,
Which never hides the blood, yet holds it in."

To have this he must be a thorough master of the language of every-day life—the homely, nervous, idiomatic, honest, pointed speech of the people. The finely modulated English, which resembles

"That soft bastard Latin

Which melts like kisses in a female mouth,
And sounds as if it should be writ on satin,
With syllables that breathe of the sweet south,
And gentle liquids gliding all so pat in,
That not a single accent seems uncouth,"

is not the vehicle which should be chosen for the transference from mind to mind of noble and heroic thoughts. Neither should we accept, as the conductor of "the electricity of thought," a mingled mass of "hipped-out phrases, stolen from every class," but rather prefer a lexicon largely interwoven with genuine Saxon. Were we to sketch a course of study suitable to the case of T. G., it would be this—a careful study of the great orators, e.g., Strafford, Selden, Hampden, Cromwell, Clifford, Shaftesbury, Lyttleton, Bolingbroke, Chesterfield, Chatham, Mansfield, Burke, Wilson, Fox, Pitt, Sheridan, Canning, Grattan, Carran, Hall, Foster, W. J. Fox, Peel, Cobden, and a few of the speeches of O'Connell and the anti-Peel invectives of Disraeli—a perusal of our older dramatists, e.g., Shakspeare, Ben Jonson, Ford, Massinger, Shirley, Beaumont and Fletcher—the works of Hooker, Jeremy Taylor, Hobbes, Swift, Bunyan, Owen, Feltham, Pope, Reid,

Smith, Paley, Hume, Macaulay, Carlyle, &c. These should be read dictionary in hand. Crabbe's, Platt's, Taylor's, and Whately's Synonymes—all good works—ought to be regularly consulted, and the precise signification of each difficult word should be firmly fixed in the mind. The modern poets, the leading articles in the chief newspapers, the debates in parliament, &c., should form part of the curriculum: while a rigorous system of training in Logic and Rhetoric ought to be diligently and carefully practised. The natural enthusiasm of a young mind—the love of virtue for its own sake—the self-sacrificing spirit of a hero must be cultivated, and then his thoughts will go swiftening through the world with wings of power.—S.N.

90. *Chivalry and the Crusades*.—In your number for June, your able correspondent, C. W., Jun., replies to a query of J. C. H., relative to the Crusades and Chivalry; and he says that he is unable to refer to any work that treats *specially* on them. I therefore would draw your querist's attention to Mill's "History of the Crusades," which is generally considered to be a good and authentic work. Further, there is the celebrated one of Michaud, which took the author upwards of twenty years to complete, and is admitted to be by Alison and others a standard authority, and the most elaborate on those stirring events. A translation of this work is being published by Routledge and Co., and two volumes out of three have already appeared.

With respect to the "History of Chivalry," Sir Walter Scott has written on it, and Mr. G. P. R. James has a volume specially devoted to the subject, drawn from Palaye and other sources. This work I have frequently seen on second-hand book-stalls. These works may suit, perhaps, J. C. H.—W. L.—h.

97. *Manchester Engineering*.—The case of your correspondent, A. B., is beset with some little difficulty, inasmuch as the greatest impediments to meeting with the situation sought, are, that he is nineteen years of age, and not being independent, some remuneration would be requisite in order to sustain him. Two courses are open to A. B., and he may avail himself of either as convenience suggests. If he is not in immediate want of such a situation as that to which he refers, he must direct his attention to the advertisements for such situations in the *Manchester Guardian*, and should he meet with any which he thinks similar to the situation he desires, he can address the party advertising, stating his case fully as to the circumstances in which he is placed, and notifying that he is dependent on the rewards of his labour, &c. If, on the other hand, he wishes to meet with a situation immediately, then he should advertise himself (and this would be the most satisfactory course he could take, as he might be capable of making a selection of the replies and of the terms offered, without loss of time); by that means he would secure other advantages of which he would be deprived by replying only to advertisements.

Unhappily for those similarly circumstanced to our friend, a revolution has of late years taken place with regard to situations, and the terms offered. The advantages offered by mechanics' and other institutions, of acquiring the rudiments of a good education, have necessarily acted as a stimulus to the rising generation, and hundreds of youths having acquired the knowledge of read-

ing, writing, and arithmetic, through the medium referred to, then have set out in quest of situations in *counting-houses*, and other mercantile pursuits. The result is, that most of them being only *ten, eleven, and twelve* years of age, a very small salary, if any, is *sought*; and as employers make the best bargains they can, they agree to take youths in the counting-house at three and four shillings per week, who have acquired a knowledge of reading, writing, and arithmetic, nothing else being required. Hence those who have received a superior education, and expect a better remuneration, have to struggle with those who undertake to do little less than themselves, at 3s. per week. In warehouses the case is still worse; a year is the least possible time for which youths are taken for *nothing*; two up to five years being a *very common* term for a person to *serve before* he receives a salary in our Manchester warehouses. Your correspondent will see the drift of these remarks. If he has received a good education, in seeking for a situation he will find himself combated by *those who have not*, and the *latter* will be *taken* if their *attainments* will enable them to *discharge* their *duties*, in *preference* to your correspondent, who has good abilities, and is consequently qualified to fill an important and responsible situation.

The fact that A. B. has a knowledge of mechanics, &c., is very much in his favour, and will be a great recommendation to him. I shall be glad to assist your correspondent in any way in my power. If he adopt the last plan I have pointed out, and would communicate with me, I might (as I reside in Manchester) give him some hints as to his advertisement. If he does not approve of either of the courses suggested, it will be well for him to write to a mechanical or engineering journal.—J. G. R.

98. *The Italian Language*.—A. A. is desirous of commencing the study of Italian. We recommend you to purchase a copy of Vergani and Piranesi's Grammar, which contains Exercises, Dialogues, Letters, Historical Anecdotes, Idiomatical Phrases, &c. This, accompanied with a dictionary, will serve as a pleasing introduction to Italian. To act as your own tutor in composition, it will be necessary to purchase besides some easy Italian book; for instance, the key to Mons. Porquet's "Tesoretto." Put a few sentences from this carefully into English. Lay them aside. Next lesson put your English into Italian, compare your exercise with the original, and you will discover your errors, if any. The pronunciation of Italian is very easy; there are some words, however, which may prove an obstacle without a master, and a few lessons in pronunciation is desirable. With a knowledge of Latin you find Italian much easier. Avoid many elementary books, especially large ones.—M. W.

99. *Homœopathy*.—H. D. C.—Your friends are most decidedly exceptions to the general order of Homœopathic patients, if they have "remarkable pale and sickly faces," and we wonder that you do not assume the position of a *friend*, and advise them to desist from a practice which they find non-effective or injurious. Those patients who have come under our notice have manifested symptoms just the reverse to those named by you: and the case of your friends affords another instance of the folly of thinking that the *same remedy* will be

equally effective in *all cases*, when there exists so great a difference in constitutions, with other reasons why it should not be so. Cold bathing is generally very beneficial, and therefore generally recommended; but there are instances in which it would be the sure precursor of cramp and rheumatic pains, and it would *therefore* be madness to persist in the practice under such circumstances.

C. W., Jun.

100. *How to Cultivate the Voice*.—In answer to the first part of "Damon's" inquiry, I would recommend him to practise the singing of the musical scale upon the following plan. Let him construct a scale such as this:—
 Let him then, if he has a voice at all, sing some note, it makes no matter whether high or low, but it is better low to commence with. He will then call that note Do, and proceed up the scale till he reaches its replicate, the upper Doh. A little practice of

Doh.
Te.
Lab.
Soh.
Fa.
Me.
Ray.
Du.

this sort will make him perfectly master of the scale. He may then change the starting note making it higher or lower, according to the pitch of the previous one, and running up and down the scale in the same manner. This is certainly simple enough as an exercise, but simple as it is, I can promise "Damon" that a month's constant, but not laborious, practice will greatly improve the power, flexibility, and compass of his voice, and will give him a greatly increased command over it. In singing he must keep his chest well open, and his *lungs pressed out against his ribs*: and, particularly if he has a *bass voice*, let him manage his voice so as to cause the *high notes* to come from the *lower* part of his throat, and the low ones from the upper part. This will be a little difficult at first, but a little patient practice will overcome the difficulty; and, indeed, the benefit, in the ease and increased pleasure of the exercise, will make him think lightly of it, be it ever so much. "Damon" will also find much information that will answer his purpose in Carwen's "Grammar of Vocal Music," price 2s. 6d., and in the articles "Music," "Larynx," and "Voice," in the "Penny Cyclopædia."—M.

100. *Elocution*.—The first step we should recommend "Damon" to take is, to obtain Tyrrell's "Practical Elocutionist" (Vickers, Holywell-street, Strand). In this book will be found much useful information of the nature required. We would suggest that the inquirer should commit to memory several of the pieces contained in this book, and then practice upon them until the voice has been drilled to the pitch, the style, and the subject of the piece selected. Having succeeded in one or two, let him try some others, and he will soon make improvement. We know students in elocution often find it extremely inconvenient to practise recitation, or declamation, by reason of their having no suitable place for the purpose. This may, in many cases, be remedied. If we remember rightly, Demosthenes sought the seashore, and there, amidst the howling of the wind, the rolling of the waves, and the dashing of the surge, he found meet companionship for the irresistible torrent of his own ungoverned eloquence, and at the same time a remedy for softening the original harshness of his voice. We know students in the same walk who have derived great advantages from a similar custom. Let those who have the opportunity try the experiment. Others may

known solitude for the purpose. fourteen would, without doubt, be ready for a commencement: however, the old adage, "Better late than never," and the earnestness which will now be put into the study will soon compensate for the delay.—C. W., Jun.

and Greek without a Master.—And "Henry's First Latin Book," by Henry, would be the most suitable to commence Latin. And as young people find Latin rather perplexing when commencing, and as the study of Latin, it would be well to observe, that the accusative invariably governs the governing verb, as in the first *abus murum aedificat*. Not "Balbus murum," or "murum," as many write, not the rule before them. In longer sentences the principal verb, too, will generally govern the end, as in the following:—

decorum est pro patria mori.

(It is decent it is for (our) country to die.)

This is precisely similar in the German; and the same will serve as an example.

du armes Shind, gethan?
(Why to thee, thou poor child, done?)

Advise L. G. to keep to this little book a few months at least before proceeding to the "Second Latin Book" by the same author, wherein will be found much valuable information, especially under the heading "Building."

At this stage we would recommend the "Latin Grammar," by Messrs. Edinburgh. It will do good service as a common-place book.

Many excellent Latin Dictionaries, but means are limited, Entick's Latin Dictionary is the advantage of being both good

Kühner's Greek Delectus, translated by Alexander Allen, would serve as a dictionary to Greek. Matthiae's Greek Lexicon; Bloomfield's Greek Testament; Duncan's Greek Testament; Wright's Lexicon, may be purchased when opportunity has been made.—M. W.

Common-place Books.—To answer the queries of "A Student" on the use of books, in detail, would occupy considerable time and space. We have referred to their uses in the June number (see Students); but we may add a few observations. No student should enter into the study of Latin without one of these common-place books, or, in addition to their direct use for the study of Latin, the method of their use is of service. It is that they are more likely accurately to record anything which they have once learned. Thus, if the common-place book be used for extracts and quotations, it will be of great use if the student go further, and devote it to understanding everything he reads, as to the method of study, as to be able, from his notes, to enter into his common-place book an abstract of the ideas and matter of his own words, he will derive a much greater benefit from the process, and his notes, when made, be highly valuable for after-reading. The difficulty of laying down any specific subject has been felt by all writers

thereon: and the reason is obvious, that as the mental capacities of each student, together with his particular pursuits, vary, so each, in order to succeed, must adopt the method most likely to serve best his own particular end. To give a simple illustration. If a student, being blessed with a good memory, have to study with another with a bad memory, both using common-place books, and reading the same works, the one will have to make his notes much more ample than the other, in order that they may be of real service to him, and compensate for his deficiency. Or, again: if we were endeavouring to acquire extensive general knowledge—embracing all subjects fairly coming within the term—and another student was desirous of studying *theology* only, our common-place book, in order to be useful to us, must be on a far more extended scale than his—probably on a different system altogether. This will be very plainly seen. The more you adapt your common-place book to your own immediate wants and circumstances, the more valuable will you find it. We now confine ourselves exclusively to an *alphabetic arrangement*, as we find it materially assists us in speedy reference. What is the use of a large store of facts and experiences, if they are not readily available? The inquiry as to whether separate books should be kept for separate studies is one which often occurs. We do not recommend too great a multiplication even of books of reference. However, where the nature of the studies are entirely distinct, separate books are certainly advisable. Thus a person studying law and general literature, would require a book for each purpose, to prevent waste of time and confusion of subject. It is quite true, as "A Student" suggests, that one book read well is better than twenty carelessly read. Our own plan is, while reading a book, to mark carefully such passages as we desire more particularly to notice in our common-place book. Having completed our first reading, we recommence the book, and devote our attention to the passages marked, extracting, as we proceed, such portions of them as we desire; adding a short reference to the title of the volume and the number of the page. Attention to these small points is of great service. When the books we read are *our own*, a simple reference to the volume and the page, under an appropriate heading, is all we require. Take two examples selected at random.—"WOMAN, her Social and Moral Influence: Mrs. Ellis's 'Wives of England,' pp. 76, 140, 185." This is under our letter W; and the next under the letter M: "MAN—the Hume and Monboddo's theory of the origin of, i.e., that he sprang up from the earth as a vegetable, and only acquired ideas and speech, with other mental endowments, by virtue of the principle of *progressive development* implanted, or rather embodied, in his nature: Bell's Introd. to Rollin's 'Arts and Sciences of the Ancients,' p. 20." We think we have said sufficient to enable "A Student," and other readers, at once to turn their attention to common-place books. We shall have occasion, in future papers on Studies for Law Students, again to touch upon some of the points here referred to. In conclusion, we will only remark that, as "A Student" seems already aware that the *manner* of reading is not of secondary importance to the *matter*, so the *manner* of keeping a common-place book is not secondary to the *matter* with which it may be filled.

C. W., Jun.

105. *University of London Matriculation.*—The matriculation examination takes place once a year, commencing on the first Tuesday in July. Candidates must have completed their sixteenth year; a certificate to this effect must be transmitted to the registrar at least fourteen days before the examination begins. A fee of two pounds is paid previous to the examination. If the candidate fail to pass, the fee is not returned to him, but he is admissible to any subsequent examination without charge. The examination is conducted by means of printed papers; but the examiners are not precluded from putting *visd voce* questions if they think fit. The subjects are as follow:—One Greek and one Latin, selected one year and a half previously by the senate (for 1852, Homer, “*Iliad*,” book xi.; Sallust, “*War with Jugurtha*”); Arithmetic, Algebra (as far as Simple Equations); the first book of Euclid, Natural Philosophy, or Chemistry, at the option of the student; the English * Language, and the Outlines of History and Geography.—Δ.

* After the year 1852, Natural Philosophy and

The only outlay required for matriculation at the London University is a fee of two pounds, which is to be paid to the registrar previous to commencement of examination. The subjects of examination are arranged under the following heads:—Mathematics, Natural Philosophy, Chemistry, Classics, the English Language, and Outlines of History and Geography. It would be impossible, without encroaching too much upon space, to enter into details which would be essentially necessary for a candidate to be acquainted with. The best piece of advice that I can offer W. G. C., supposing he intends to matriculate, is to obtain the “*London University Calendar*” for 1852, price 3s., published by Taylor and Walton, Upper Gower-street, in which he will find full information with regard to the required course, and will also have an opportunity of seeing, from the examination papers of last year, the nature of the questions proposed.

AN UNDERGRADUATE.

Chemistry, as well as Translation from the French or the German Languages, will be required.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XVII.

- 1. What is Truth?
- 2. Define, and distinguish between, the terms Truth, Error, Falsity, Falsehood, Fallacy, and Sophism.
- 3. What are the chief kinds of Error-sources?
- 4. Explain what is meant by Intellectual Error-sources.
- 5. Explain what is meant by Volitionary Error-sources?
- 6. What is the Aristotelic Classification of Fallacies, with examples?
- 7. Explain J. S. Mill's Synoptic Table of Fallacies.
- 8. How many varieties of pure Logical Fallacies are there? Exemplify them.
- 9. How may pure Logical Fallacies be detected?

GRAMMAR CLASS.

Exercises in Grammar.—No. VI.

- 1. Arrange the nouns of the following sentences in a form like that given:—

The father loves his children. The house is guarded by the dog. The “*Farmer's Boy*” was written by Bloomfield. Bunyan wrote the “*Pilgrim's Progress*.” Bats' wings contain no feathers. Moses' books are five in number. Cromwell's actions have been much misrepresented. St. James's Church was struck by lightning. Englishmen will never forget Wellington's victories. The warrior has been honoured more than he deserves—the legislator less. The history of Caesar's wars was written by himself. The master's interests are studied by the servant. St. Helena's isle was Napoleon's prison. The boy's books are torn. The honour of Britain is dear to her sons. A good book is the author's life-blood. Hannibal's wintering in Capua drove him from Italy. The monarch's tyranny effected his ruin. We read the doctor's book, and approve of its principles.

Breathes there a man with soul so dead,
Who never to himself hath said,
This is my own, my native land;
Whose heart hath ne'er within him burned,
As home his footsteps he hath turned
From wandering on a foreign strand?

Question 17. The least common multiple of 14,

20, and 48 = 1680; therefore the travellers will all meet again at the same place in 1680 days from Christmas-day, 1851; which, allowing leap-year in 1852 and 1856, will fall on July 3, 1856.

For, Dec. 25, 1851, to Dec. 25, 1852 = 366 days.

Dec. 25, 1852, to Dec. 25, 1853 = 365

Dec. 25, 1853, to Dec. 25, 1854 = 365

Dec. 25, 1854, to Dec. 25, 1855 = 365

Dec. 25, 1855, to Dec. 31, 1855 = 6

Jan., 1856 = 31

Feb., 1856 = 29

March, 1856 = 31

April, 1856 = 30

May, 1856 = 31

June, 1856 = 30

July, 1856 = 31

1680
C. D. S.

Ans. July 31st, 1856.

Question 18. Here the number of cubic feet in the lump is 11071.7902×10534 , number of oz. in a cubic foot = $116,830,237.9668$, weight in oz. = $35,840 = 3254.1919$ tons weight. Then the value of 1 oz. being £.275, which \times by 10534, number of oz. in a cubic foot = £2896.85, value of 1 cubic foot.

\therefore Value of whole lump = $2896.85 \times 11071.7902 = £32,073,315.44087$.—Ans. R. J.

Question 19. Let x, y , and z equal A, B, and C's shares respectively. We have then, from the conditions of the question, the following equations, involving three unknown quantities.

$$x + \frac{y+z}{2} = £100 \quad (1)$$

$$y + \frac{x+z}{3} = £100 \quad (2)$$

$$z + \frac{x+y}{4} = £100 \quad (3)$$

By clearing these equations of fractions, we get the following:—

$$2x + y + z = £200 \quad (1)$$

$$x + 3y + z = £300 \quad (2)$$

$$x + y + 4z = £400 \quad (3)$$

Then subtracting (1) from (2) we get

$$-x + 2y = £100 \quad (4)$$

And by subtracting (3) from (1) $\times 4$ we get

$$7x + 3y = £400 \quad (5)$$

Here we have two equations, (4) and (5), involving only two unknown quantities, x and y .

By solving these in the usual way, we find that

$$x = £29 \text{ 8s. } 2\frac{1}{4}\text{d.}$$

$$y = £64 \text{ 14s. } 1\frac{1}{4}\text{d.}$$

Then substituting in (1) these values for x and y , we can find the value of z by subtracting their sum from £200, (viz.) $z = £200 - £123 \text{ 10s. } 7\frac{1}{4}\text{d.} = £76 \text{ 9s. } 4\frac{1}{4}\text{d.}$

From (1) then it appears that £29 8s. $2\frac{1}{4}\text{d.}$, £64 14s. $1\frac{1}{4}\text{d.}$, and £76 9s. $4\frac{1}{4}\text{d.}$, are the values of x, y , and z , respectively.

If, then, these be the true values of the letters, it follows that if we substitute these values for the letters themselves in (1), (2), and (3), the sum of their values will equal that of the letters in each respectively.

i.e., that £56 16s. $5\frac{1}{4}\text{d.}$ + £64 14s. $1\frac{1}{4}\text{d.}$ + £76 9s. $4\frac{1}{4}\text{d.}$ should = £200.

And that £29 8s. $2\frac{1}{4}\text{d.}$ + £194 2s. $4\frac{1}{4}\text{d.}$ + £76 9s. $4\frac{1}{4}\text{d.}$ should = £300.

And that £29 8s. $2\frac{1}{4}\text{d.}$ + £64 14s. $1\frac{1}{4}\text{d.}$ + £306 17s. $7\frac{1}{4}\text{d.}$ should = £400.

Since this is the case, $x = £29 \text{ 8s. } 2\frac{1}{4}\text{d.}$; $y = £64 \text{ 14s. } 1\frac{1}{4}\text{d.}$; and $z = £76 \text{ 9s. } 4\frac{1}{4}\text{d.}$

J. M. A.

Question 20. $x - y = 12$
 $x^2 - y^2 = 336$

Since $x^2 - y^2 = x + y \times x - y = 12 \times x + y$

$\therefore 12 \times x + y = 336$

and $x + y = 28$

but $x - y = 12$

by addition $2x = 40$

and $x = 20$

and by subtraction $2y = 16$

$\therefore y = 8$

R. M.

Geometry.

Question 10. (a) The solidity of a sphere is equal to the cube of the diameter multiplied by .5236; hence dividing the solidity by .5236, and extracting the cube root of the quotient, will give the diameter.

Therefore diameter

$$= \sqrt[3]{\frac{11071.7902}{.5236}} = \sqrt[3]{21145.512223} = 27.65$$

(b). The number of ounces in one cubic foot = $10.534 \times 1000 = 10534$

The value of do., do., = $10534 \times .275 = 2896.45$

Hence side of cube

$$= \sqrt[3]{\frac{760,000,000}{2896.85}} = \sqrt[3]{262354.623} = 64.01$$

J. J. M.

Mechanics.

Question 9. The contents of the tank = $20 \times 12 \times 9 = 2160$ feet, and this being divided by 24, the area of the section of the well gives 90 feet, the difference in the level of its water at the commencement and end of the operation.

Hence $45 + 36 + 4.5 = 85.5 =$ the distance between the middle of the tank and the mean level of the water in the well, which, being multiplied by the weight of the volume of water in the tank, gives the units of work required to fill it; this being divided by 33000×6 , the units of work performed by the engine per minute will give the time required.

$$\frac{62.5 \times 2160 \times 85.5}{33000 \times 6} = 58.295 \text{ minutes.}$$

QUESTIONS FOR SOLUTION.—VII.

Arithmetic and Algebra.

24. The train A leaves London at the same time as the train B leaves Bristol, on the Great Western Railway; but the train B arrives in London 5 hours, and A in Bristol 9 hours after they meet. How long was each upon the road?

25. I bought a certain number of sheep for £31 10s. Now, had there been three less for the money, they would have cost me 5s. a head more. How many did I buy?

26. At what time between the hours of five and six will the hour and minute hands be together?

27. Given $x + y = 24$, and $x^2 - y^2 = 96$, to find x and y .

Geometry.

12. A circular mound, whose radius is 90 feet, is surrounded by a moat 40 feet wide. What is the area of the moat?

13. The greatest possible sphere is to be made out of a cubic block of freestone, whose side is 4·5 feet. Required its superficial and solid content.

Mechanics.

12. A train of 50 tons moves at the rate of 30 miles per hour on the level rail; the resistance of friction upon the rail is 8 lb. per ton, the resistance of the atmosphere 33 lb. on the whole train when it moves at the rate of 10 miles per hour.

The diameter of the driving wheel 6 feet, the area of the piston 100 inches, the length of the stroke 1·5 feet, the resistance due to the blast-pipe 1·75 lb. per inch of the piston, when the speed of the train is 10 miles per hour. It is required to determine the pressure of the steam, the evaporation of the boiler, and the number of bushels of coals necessary for a journey of 120 miles, supposing 1 bushel will evaporate 11·5 cubic feet of water.

Notices of Books.

Old Eighteen-Fifty-One; a Tale for any Day in 1852. By the Author of "Pleasant Pages." London: Houlston and Stoneman.

This is designed as the first of a series of year books for young people. The editor of "Pleasant Pages" represents himself as inviting to his house a pleasant party of young folks on the last evening of the old year. In the course of the entertainment, and by phantasmagoric means, an old man is introduced, who turns out to be Eighteen-Fifty-One, who has only two hours to live! He offers to tell the company of the wonderful things he has seen—an offer which is gladly accepted; and he then begins to talk of intellectual, sanitary, social, temperance, peace, anti-slavery, and national progress; and goes on to speak of the Great Exhibition, and to chat about general news, good and bad, home and foreign. One, at least, of his juvenile auditors appears to have thought that he was attempting too much, and we are decidedly of his opinion. Although we admire the plan of the book, and acknowledge the general interest thrown around many of the subjects, we believe that that interest would have been much stronger had fewer topics been touched upon, or greater space secured to each. We need not remind Mr. Newcombe, nor any well-qualified instructor, that the surest way to gain the attention of the young is to amplify and simplify, not to generalize or enumerate, and therefore we recommend him to increase the size of his next volume, or to reduce the range of his subjects. In the meantime, we hope the present little work will secure an immense sale, for nothing but this can make it remunerative, seeing that it is got up in a superior style, beautifully bound, and sold for one shilling. We need scarcely say that we look with interest upon Mr. Newcombe's various undertakings for the benefit of the young, and believe that he deserves the support of all who wish

"To try the rivalry of arts,
Of science, learning, freedom, fame—
To try who first shall light the world
With Charity's divinest flame."

A Manual of Logic, Deductive and Inductive. By H. H. Munro. London: Hamilton, Adams, and Co.

In our January number we reviewed "Logic for the Million," and expressed our conviction that it, "as a sequel to the study of any of the more rigid and abstract works on the subject, would be of much service." The work now before us is exactly such an one. It is a regularly digested and philosophic treatise on Logic, evidently the production of an acute mind, and

highly deserving of the attention of the student. While inclined to advocate the *formal* view of the science, the author does not feel warranted, it seems, to depart from the usual method of writing on the subject, so far as the full adoption of that theory would demand. He does not profess to develop and methodize new views, but to exhibit in a clear, succinct, methodical manner, the most useful portions of the already-received doctrines of logical science. Some of the preliminary topics of discussion, e.g., "Terms," "Abstraction," and "Generalization," the "Predicables," &c., are excellently conducted, while some of the more intricate "tabular forms" of other logicians have been reconstructed and simplified. The Syllogistic examples, too, are more various and less puerile than those generally seen in books of the kind. The style is plain, perspicuous, and concise, and the work, as a whole, is well calculated to fulfil the author's purpose, viz., "to facilitate an earlier and easier acquaintance with the science than is at present attainable." The following "Table of Opposition," which we prefer to that of Whately, we extract, for the behoof of our "Logic pupils:"—

The subject of Opposition, it will be remembered, was discussed in "The Art of Reasoning No. XIII."

OPPOSITION.	Subaltern	{ between A. & I.	A.	I.
			N. True. I. False. C. False.	True. False. True.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. VIII.—ON STYLE.

HAVING, in a previous paper, defined the sense in which the word "Style" is to be understood, and indicated some of the essential pre-requisites for the formation of an accurate, pleasing, and vivid method of thought-utterance; having shown that extensive knowledge, sound judgment, mental culture, precision of thought, and delicacy of taste are the foundations of all excellence in speaking or writing; we shall now proceed to present our readers with a series of practical instructions in the use of Language.

This is by no means so easy a task as many may be apt to imagine. It is difficult to reduce to formulæ the nice distinctions which the keen-seeing eye of the critic perceives as existing between the proper and the incorrect. Some even believe that there is an instinctive acuteness in certain of the mental powers which enables certain men to fill the office of critic, and to become the umpires of literary taste. But whether this be the fact or not, it seems to us quite evident that the assiduous culture of the finer perceptivities—those which concern themselves with *the fitting*—must tend to the evoking of a higher degree of sensibility, and a greater nicety of skill in the use of words, than the leaving of them uncultured. The fruit of the wild vine is scarcely so delicious as the grape-clusters of one that has been carefully nurtured. Let us not, however, be misunderstood as asserting that Genius can be manufactured, or that any system of rules, however diligently culled or laboriously practised, will supersede the necessity of original thought. These studies will, of course, concentrate the faculties, acumenate the powers, and fit them for exertion; but they cannot avert the pangs of thought-birth. "Rules are designed to check a genius that is irregular, not to damp the ardour of that genius which takes wing: their chief use is to prevent those passages which are truly eloquent from being debased by others in which negligence or bad taste prevails."* "It is not for the sake of enabling men to produce beauties, but of qualifying them to avoid faultiness of style, that the rules of the great masters have been instituted. Nature forms men of genius as she forms precious metals in the bowels of the earth, rough, irregular, and compounded with other substances. Art is of no other service to genius than it is to these metals: it adds nothing to their substance, it only separates what is foreign, and displays in full perfection the genuine work of Nature."† We believe that Style and Thought are reactive—that great "eagle-winged" thoughts will not suffer themselves to be caparisoned to an unworthy vehicle—and that elegance of composition cannot fitly be employed on stale and little ideas. We cannot use "the birds of Jove" to run the messages of the inferior gods, nor can we look complacently upon

"The ocean into tempest tossed,
To wait a feather or to drown a fly."

Although, however, valuable ideas, just and clear conceptions of a subject, a vivid

* D'Alembert's "Reflections on Eloquence."

† D'Alembert's "Discourse before the French Academy."

imagination, ready associations, elevated sentiments, and a well-cultured taste, are decided essential to good composition, it does not follow that any man possessed of these qualifications is capable of so discoursing or writing as to ensure success. He must have, in addition, acute powers of discrimination—selection, arrangement, combination, and practical readiness—an accurate knowledge of language, skill in its use, choiceness of expression, and copiousness of vocabulary. Only by a union of such qualifications, natural and acquired, wrought up into activity, energy, and power, and rendered capable, by patient and continuous culture and exercise, of giving adequate expression to the treasured wisdom of his soul, can he become one of those

“ Who shed great thoughts
As easily as an oak looseneth its golden leaves
In kindly largess to the soil it grew on—
Whose rich, dark, ivy thoughts, sunned o’er with love,
Flourish around the stems of their deathless names—
Whose names are ever on the world’s broad tongue,
Like sound upon the falling of a force—
Whose words, if winged, are with angels’ wings—
Who play upon the heart as on a harp,
And make our eyes bright as we speak of them—
Whose hearts have a look southwards, and are open
To the whole noon of Nature.”

We shall make no apology for the minuteness and apparent triviality of those directions which we shall find it necessary to give. “The rudiments of every art and science exhibit, at first, to the learner, the appearance of littleness and insignificance. And it is by attending to such reflections as to a superficial observer would appear minute and hypercritical, that language must be improved and knowledge perfected.”* “Of all the works of man, Language is the most enduring, and partakes the most of eternity. And as our language, so far as thought can project itself into the future, seems likely to be coeval (co-equal in existence?) with the world, and to spread vastly beyond even its present immeasurable limits, there cannot easily be a nobler object of ambition than to purify and better it.”† Neither can we consider ourselves necessitated to excuse ourselves for the vast amount of exertion which such a system of cultivation as we shall advise must entail on the diligent student. “Whenever labour implies the exertion of thought, it does good, at least to the strong; when the saving of labour is a saving of thought, it enfeebles. The mind, like the body, is strengthened by hard exercise.”‡ Now, we must confess that “the attainment of a correct and elegant style is an object which demands application and labour. If any imagine they can catch it merely by the ear, or acquire it by the slight perusal of some of our good authors, they will find themselves much disappointed. The many errors even in point of grammar, the many offences against purity of language, which are committed by writers who are far from being contemptible, demonstrate that a careful study of the language is requisite in all who aim at writing it properly.”§

Style, so far as its mere mechanism is concerned, may, for convenience of treatment, be considered as divided into two parts—1st, Diction; 2nd, Structure; the supreme canons

* Campbell's “Philosophy of Rhetoric,” p. 244. † “Philological Museum,” vol. i. p. 653.

‡ “Philological Museum,” vol. i. p. 636.

§ Blair's “Lectures on Rhetoric,” lect. ix. vol. i. p. 211.

of which are—of the former, *Speak and write words according to the signification which strictly belongs to each*; of the latter, *Observe the relations which subsist amongst ideas, and represent these relations by such concatenations of vocables, such variations in the reflections of words, and such a use of particles, as are customary in the writings of the best authors in that language*. We shall confine our attention for the present to the elucidation of the rules which are applicable to Diction.

The qualities of Diction are—I. Purity; II. Simplicity; III. Propriety; and, IV. Precision.

I. Purity of Diction is the employment of such words and phrases exclusively, as, according to the best authorities, really belong to the particular language in which we speak or write.

II. Simplicity of Diction consists in the use of such words and phrases as are most frequently and commonly employed, such as are easily comprehended, and level to the capacities of ordinary men.

III. Propriety of Diction is the employment of words in such a manner as to preserve the precise signification which "the best usage" has attached to each of them, as well as in carefully discriminating the nicer and more delicate shades of meaning which they acquire in peculiar collocations.

IV. Precision of Diction consists in giving exact expression to each particular thought in the most unambiguous manner, so as to set misconception, as far as possible, at defiance—employing words in rigidly-defined senses with unswerving uniformity and undeviating care.

"It is not enough that men have ideas—determined ideas—for which they make these signs (words) stand; but they must also take care to apply their words, as near as may be, to such ideas as common use has annexed them to. For words—especially of languages already framed—being no man's private possession, but the common measure of commerce and communication, it is not for any one, at pleasure, to change the stamp they are current in, nor alter the ideas to which they are affixed; or at least, when there is a necessity to do so, he is bound to give notice of it. Men's intentions in speaking are, or at least should be, to be understood, which cannot be without frequent explanations, demands, and other the like incommodious interruptions where men do not follow common use. Propriety of speech is that which gives our thoughts entrance into other men's minds with the greatest ease and advantage, and therefore deserves some part of our care and study, especially in the names of moral terms. The proper use and signification of terms is best to be learned from those who, in their writings and discourses, appear to have had the clearest notions and applied to them their terms with the exactest choice and fitness. This way of using a man's words according to the propriety of the language, though it have not always the good fortune to be understood, yet most commonly leaves the blame of it on him who is so unskilful in the language he speaks as not to be able to understand it when made use of as it ought to be."*

"Language is established by reason, antiquity, authority, and custom. Of reason, the chief ground is analogy, but sometimes etymology. Its antiquity recommends itself to us

* Locke's "Essay Concerning Human Understanding," book iii. chap. 11. sec. ix.

by a certain air of majesty, and I might almost say reverential feeling. Its authority is to be sought in historians and orators; the necessities of metre often excuses the poet. When the judgment and example of the great masters of eloquence are accepted as rules, even error seems right to those who offend in imitating them. But the common usage of the most polite writers and speakers is the most certain guide in the use of words; for speech like money, when it receives the public stamp, should attain a currency. * * * I, therefore, look upon the general practice of the learned and polite as the usage of a language—just as the general conduct of the virtuous and fashionable is to be regarded as the etiquette of life.”*

How, then, shall we most easily and accurately attain this knowledge of “the best usage”? To understand this fully we must remember—1st. That words are the representatives or symbols of thought, and serve to call up into the mind the particular ideas which they are the mental signs; 2nd. That there is no natural, necessary, and essential connexion between these “signs and the things signified thereby;” 3rd. That at different periods different words are employed in the same language to symbolize the selfsame ideas; and, 4th. That conventional agreement is that by which the peculiar signification of each term is adhibited to it, and to it only.

Now, bearing these things in mind, we are led to inquire, with even greater perplexity and anxiety, how shall we attain a knowledge of the best usage? We shall explain. Certain gentlemen of reputation have employed themselves in carefully investigating the signification of words, weighing in their minds the peculiar use made of the word by the best authors and speakers—the etymological connexions which it has with others—the general analogy of the language and the necessities of the human mind. The results of these studies they have stored up in voluminous though useful works for our advantage. When, therefore, we are desirous of learning the usage of a language, we must consult the lexicographers and discover the result of their laborious toil. In general this will yield us the information sought, although “Language is in its very nature inadequate, ambiguous, liable to infinite abuse, even from negligence, and so liable to it from design,” that great caution and care are necessary in order to make a proper use of this assistance; while, at the same time, the progress of refinement, the desire for significant and harmonious words, and the increased luxuriance of taste which an advanced civilization produces, cause a constant fluctuation in the use of words. No instructions, it is obvious, can adequately guard us against minor errors; but the following general rules may, and we hope will, be serviceable in teaching the greater part of the errors in Diction which it is advisable to avoid.

I. PURITY.—1st. Unless there be some special reason for their use, all obsolete or antiquated expressions ought to be carefully avoided. The following are examples of the kind of words meant:—Fictious, timidous, greatening, belikely, cruciate, unctuation, exscribe, coagmentation, easiliest, manuduction, plurious, commentitious, avolation, failious, rutilate, negoce, acception, affrontiveness, acconglutination, &c.

2nd. Strange or unauthorized vocables ought to be as seldom employed as possible; never without a special reason. Examples of such words we subjoin:—Extroitive, introitive,

* Quinetillan's “Institutes.”

unletupable, wide-awake-ity, go-awayness, pocketually, betweenity, fashiondom, connexity, absquatulate, flabber-gas-tuality, plumptitude, adoremment, judgmatical, corrosivisity, magneticalized, &c.

3rd. The unnecessary introduction of foreign phrases or idioms, and poetical forms of expression, are reprehensible: *e. g.*, *Delicatesse, fraîcheur, délasement, la famiglia, étoffe, demi-toilette, chevachie, des notres, habitués, odeur*; "It serves to an excellent purpose;" "All that youth has of amiable;" "The night, now far advanced, was brilliantly bright with the radiance of lunar and astral effulgence;" "The fair moon, taking her external promenade along the cloudless azure and stellar canopy of heaven, walked in all the resplendency of her highest and brightest glory," &c.

II. SIMPLICITY.—1st. Words unnecessarily complex or abstruse, unless absolutely necessary, ought not to be used: *e. g.*, Configuration for *figure*, deleterious for *hurtful* or *injurious*, electrotyping for *impressing*, &c.

2nd. Technical terms ought not to be unnecessarily introduced: *e. g.*, Velocity for *speed*, infinitesimal for *very small*, specific gravity for *weight*, density for *thickness*, &c.

3rd. "Nothing can contribute more to enliven expression than that all the words employed be as particular and determinate in their signification as will suit with the nature and scope of the discourse. The more general the terms are the fainter is the picture, the more special they are it is the brighter."*

III. PROPRIETY.—1st. Equivocal or ambiguous expressions are carefully to be guarded against: *e. g.*—

"He aimed at nothing less than the crown;" meaning, either "nothing was less aimed at by him than the crown," or "nothing inferior to the crown was aimed at by him."

"The whites and blues gained the prize." Were "the whites and blues" one and the same, or were they individually different?

"His memory shall be lost on the earth." Shall he forget or be forgotten?

2nd. Unintelligible, inconsistent, or inappropriate terms ought to be eschewed: *e. g.*,

"These words do not even convey an *opaque* idea of the author's meaning."

"If the savour of things lies cross to honesty; if the fancy be florid, and the appetite high towards the subaltern beauties, and lower order of worldly symmetries and proportions, the conduct will infallibly turn the latter way."†

"Some pains have been thrown away in attempting to *retrieve* (regain) the names of those to whom he alludes."‡

3rd. Avoid vulgarisms and provincialisms: *e. g.*, Hurlyburlies, pell-mell, the tables were turned, to get into a scrape, thinks I to myself, says I, overtopple, currying favour, left to shift for one's self, &c.

IV. PRECISION.—1st. Retrench all tautological expressions: *e. g.*, "They have a *mutual dislike to each other*." "When will you *return again*?" "They returned *back again* to the same city *from whence* they came forth." The italics indicate the tautologies.

2nd. Repeat the same word whenever absolutely necessary: leave no expression incomplete or ambiguous for the deficiency of expression: *e. g.*, "This house is built of the same stones as that one" (kind).

* Campbell's "Philosophy of Rhetoric," vol. ii. p. 137.

† Shakespeare's "Characteristics," vol. iii. misc. ii. ch. 2. ‡ Hallam's "Lit. of Middle Ages," vol. i. p. 132.

The sentence—"Moral *precepts* are *precepts* the reasons of which we can see,"* is an example of correct usage.

3rd. Be careful not to confound words apparently synonymous, or otherwise bearing a resemblance to each other. "Words apparently synonymous, and really so in the great majority of instances, have nevertheless each an appropriate meaning, which on certain occasions is made to appear. The propriety of meaning is known *à priori* by the scholar who is acquainted with the etymology of the word, but the person who has collected its meaning only from its use is ever liable to mistakes, and often to the most ridiculous mistakes; because, perhaps, in the course of his experience it has never been used in such a manner as to demonstrate its peculiar signification: *e. g.*, Benevolence and Philanthropy are frequently synonymous; they might, nine times out of ten, be substituted for one another; and an illiterate person, collecting that each term is applied to characters and actions of kindness, mercy, and humanity, will indiscriminately use them, even when that humanity is shown towards the brute creation, than which mistake nothing could be more ludicrous."† Further examples of this error we subjoin, *viz.* :—Critic, critique; observance, observation; conscience, consciousness; endurance, duration; successfully, successively; contagious, contiguous; ingenious, ingenuous; eminent, imminent; subtle, subtile; luxurious, luxuriant; continual, continuous, &c. The following sentence contains an apt illustration of the clearness given by attention to the delicate shades of signification, by which words nearly synonymous are frequently distinguished, *viz.* :—"The diligent student may *acquire* knowledge, *obtain* rewards, *win* prizes, *gain* celebrity, and *get* high honours, though he *earn* no money."

4th. Words ought not to be used with the signification of the language from which they are derived, when another meaning has been attached to it in the language of the writer: *e. g.*, "I have considered the subject in its integrity,"—where integrity, from *integer*, whole, means *entirety*, instead of honesty, uprightness, wholeness of moral character, which is its usual signification.

Such are a few of the rules of expression which we desire to impress upon the minds of our readers. In our next article we shall pursue the subject, when we hope to have the patient attention of our readers. Dry, tedious, and uninteresting as our remarks may appear, they are useful. Pray let them be carefully studied.

* Butler's "Analogy," p. 165.

† "The Common-place Book" of the late Bishop Copplestone, quoted in the preface of Whately's "Synonymes."

THOUSANDS of men breathe, move, and live—pass off the stage of life, and are heard of no more. Why? None are blessed by them; none could point to them as the means of their redemption: not a line they wrote, not a word they spoke, could be recalled, and so they perished; their light went out in darkness, and they were not remembered more than the insects of yesterday. Will you thus live and die? Live for something. Do good, and leave behind you a monument of virtue that the storms of time can never destroy. Write your name, by kindness, love, and mercy, on the hearts of thousands you come in contact with year by year, and you will never be forgotten. No; your name, your deeds, will be as legible on the hearts you leave behind you, as the stars upon the brow of the evening. Good deeds will shine as brightly on the earth as the stars of heaven.

Religion.

CAN CHRISTIANS, CONSISTENTLY WITH THEIR PRINCIPLES, RENDER SUPPORT TO THE BRITISH STAGE?

AFFIRMATIVE ARTICLE.—V.

IN taking up my pen to write upon this subject, I shall not attempt to criticise any of the articles that have appeared in this debate, but rather give my own views on the subject as briefly as possible.

In the first place, I would inquire whether the theatre may be supported merely on the ground of its being a source of amusement? That it is a source of amusement none will attempt to deny, and this characteristic has commended it to the attention of many of the great and good. Dr. Johnson says:—"I am a constant frequenter of the playhouse: *where else can one have so much entertainment with so little concurrence of one's own endeavours.* At all other assemblies he that comes to receive delight will be expected to give it; but in the theatre nothing is necessary to the amusement of two hours but to sit down and be *willing to be pleased.*" Addison, in *the Spectator*, says:—"As a perfect tragedy is the noblest production of human nature, so it is capable of giving the mind one of the most *delightful and improving entertainments.*" "A virtuous man (says Seneca) struggling with misfortunes is such a spectacle as gods might look upon with pleasure, and such a pleasure it is which one meets with in a well-written tragedy. *Diversions of this kind wear out of our thoughts everything that is mean and little. They cherish and cultivate that humanity which is the ornament of our nature. They soften insolence, soothe affliction, and subdue the mind to the dispensations of Providence.* It is no wonder, therefore, that, in all polite nations of the world the drama has met with public encouragement." Again, in another part of the *Spectator*, we find this passage:—"Pleasures and recreation, of one kind or another, are absolutely necessary to relieve our minds and bodies from too constant attention and labour; where, therefore, public diversions are tolerated, it behoves persons of distinction, with their power and example, to preside over them in such a

manner as to check anything that tends to the corruption of manners, or which is too mean or trivial for the entertainment of rational creatures." From the foregoing remarks I infer that support may be rendered to the "British stage" as an excellent source of amusement; for, though religion condemns such pleasures as are immoral, it manifests no improper austerity with respect to those that are innocent. The cautious discipline it prescribes excludes us not from the gay enjoyments of life; but rather admits them as recreations from care, as instruments for promoting friendship and of enlivening social intercourse.

But, further, the stage is worthy of support from the fact that much real good may be derived from it. Dramatic poetry has been esteemed by all civilized nations. It is divided into the two forms of tragedy and comedy. The former rests upon the strong passions, the virtues, crimes, and sufferings of mankind; the latter on their humours, follies, and pleasures. In the former, terror and pity are the great instruments; but ridicule mainly so in the latter.

Tragedy, considered as an exhibition of the character and behaviour of men, in some of the most trying and critical situations of life, is a noble kind of poetry. It is a direct imitation of human actions and manners: it is a mirror in which we behold ourselves, and the evils to which we are exposed. Tragedy, in its general strain and spirit, is *favourable to virtue.* Such power hath virtue over the human mind, by the wise constitution of our nature, that our passions cannot be strongly moved without at the same time awakening within us some virtuous emotions. We feel interested in those characters who are represented as virtuous and honourable, and an indignity is raised against the objects of vice and depravity. Sometimes, indeed, the virtuous may be represented as unfortunate; but this is often the case in real life, and our hearts will always be engaged in their behalf.

Even when bad men succeed in their designs, punishment is always made to attend them; and misery of one kind or other is shown to be unavoidably connected with guilt. Love and admiration of virtuous characters, compassion for the injured and distressed, and indignation against the authors of their suffering, are the sentiments most generally excited by tragedy. And, therefore, though dramatic writers may sometimes, like others, be guilty of improprieties, yet we must admit that tragedy is a species of moral compensation. Aristotle says the design of tragedy is "to purge our passions by means of pity and terror;" while another says, "Tragedy is intended to improve our virtuous sensibility." Modern tragedy has aimed at pointing out to men the consequences of their own misconduct, showing the direful effects which ambition, jealousy, love, resentment, and other strong emotions, when misgarded or left unrestrained, produce upon human life. A *Macbeth*, incited by ambition to commit the crime of murder; an *Othello*, hurried by jealousy to put to death his innocent wife; a *Jaffier*, ensnared by resentment and want to engage in a conspiracy, and then stung with remorse and involved in ruin; a *Calista*, seduced into a criminal intrigue which overwhelms herself, her father, and her friends in misery;—these, and such as these, are the examples which tragedy displays to public view, and by means of which it inculcates the proper government of the passions.

Comedy is distinguished from tragedy by its general spirit and strain. While pity and terror, and the other strong passions, form the province of tragedy, the chief instrument of comedy is ridicule. Comedy has for its subject neither the great sufferings nor great crimes of men, but their follies and slighter vices, with those parts of their character which raise in beholders a sense of impropriety, which expose them to be censured and laughed at by others, and which render them troublesome in society. There is nothing in the idea of this kind of composition that renders it liable to censure. To polish the manners of men—to promote attention to the proper decorum of social behaviour—and, above all, to render vice ridiculous—is doing a real service to the world. Ben Jonson well says,

"My strict hand"
Was made to seize on vice, and with a gripe

Squeeze out the humour of such spongy souls
As lick up every idle vanity."

The insight which is given by theatrical performances into real life is a very great advantage attendant upon them. He who has not been "hackney'd in the ways of men" may here find a true picture of their extravagances. When a man is made up of the dove, without a particle of the serpent, he becomes ridiculous in many circumstances of life. The Cordeliers tell a story of their founder, Sir Francis, that, in passing through the streets in the dusk of the evening, he discovered a young fellow with a maid in a corner, upon which the good man lifted up his hands to heaven with secret thanksgiving that there was still so much christian charity in the world. The innocence of the saint made him mistake the kiss of the lover for a salute of charity. Thus, then, the representations from the theatre will disclose to us the motives of many of the actions of our fellow-creatures of which we should otherwise be ignorant. This I consider one great consideration in its favour; for, as Addison says, "*I am heartily concerned when I see a virtuous man without a competent knowledge of the world.*"

Having described the benefits which may be derived from the stage "*as it ought to be,*" I do not wish to close my eyes to the stage "*as it really is.*" I doubt not but that it is the scene of many improprieties, both in words and actions. But I would ask, what is there in the world that is not liable to perversion and abuse? We cannot mention one single blessing that has not been, at some time or other, perverted. Are the evils said to be at present attendant on the British stage necessarily so, and cannot the British stage be supported without encouraging vice? If it can, then it is the duty of all Christians to support it, and to remove from it all that is of an immoral tendency, and thus to provide for the people that which is so desirable—an amusement which is not pernicious or hurtful to their morals.

One great reason adduced by many for their opposition to theatrical performances is, that no moral truth should ever be conveyed to the mind under the garb of fiction. I think that fictitious history is one of the best channels for conveying instruction—for painting human life and manners—for showing the errors into which we are betrayed

by our passions—and for rendering virtue amiable and vice odious. Lord Bacon takes notice of the taste for fiction as a proof of the greatness and dignity of the human mind: he observes that the objects of this world, and the common train of affairs which we behold going on in it, do not fill the mind, nor give it entire satisfaction. We seek for something that shall expand the mind in a greater degree; we seek for more heroic and illustrious deeds, for more diversified and surprising events; for a more splendid order of things; a more regular and just distribution of rewards and punishment than we find here: and thus we have resort to fiction; we create worlds according to our fancy, in order to gratify our capricious desires.

I shall not attempt to deny that the province of comedy has frequently been abused, and therefore has been deserving of some censure; but, as I have stated, it is on comedy alone that such reproach is justifiable. *Bulcane* is an instrument of such a nature that, when managed by *unskilful or improper hands*, there is hazard of its doing mischief instead of good to society. Licentious writers, therefore, of the comic class, have too often had it in their power to cast a ridicule upon characters and objects which did not deserve it; but this is a fault *not owing to the nature of comedy*, but to the writers of it. In the hands of a loose, immoral author, comedy will mislead and corrupt, while in those of a virtuous and well-instructed one it will not only be a gay and innocent, but a *knowledgeable and useful enter-*

tainment. We will admit that the writings of Wycherley, Congreve, Farquhar, and others, have in them a slight tendency to immorality; but that is looking at the question "*as it was*," and not "*as it is*." I think we ought now to confess the truth of what a learned writer states on the subject:—"I am happy to have it in my power to observe, that of late years a sensible reformation has begun to take place in English comedy; we have at last become ashamed of making our public entertainments rest wholly upon profligate characters; and our later comedies are much purified from the licentiousness of former times. If they have not the spirit, the ease, and the wit of Congreve and Farquhar, they may, however, justly merit the praise of being innocent and moral."

I have thus laid the case before the readers of this magazine in the fairest light I can, without any misrepresentation on either side. I have endeavoured to draw a true picture of the stage and its effects, and I trust I have convinced some that, although the stage may not now be all we could wish, it is the duty of Christians to strive to improve it. Massinger has well said—

" 'Tis urged
That we corrupt youth, and truauce superiors,
When we do bring a vice upon the stage.
That does go off unpunished. Do we teach,
By the success of wicked undertakings,
Others to tread in their forbidden footsteps?
We show no arts of Lydian panderism,
Corinthian poisons, Persian flatteries,
But mulcted so in the conclusion, that
Even those spectators that were so inclined
Go home chang'd men."

D. II.

NEGATIVE ARTICLE.—V.

As this discussion will necessarily elicit opinions affecting the moral and religious character of thousands, we ought to be very calm and dispassionate, as well as conscientious, in evolving those opinions; then they will be such as, when dying, we shall not wish to retract. We take it for granted that the principles of a Christian are the same as those enunciated in the word of God, especially in that part of it called the New Testament; and, if so, we fearlessly avow our opinion that these principles are radically antagonistic to, and vitally incompatible with, the principles of the British stage as it is, and as it always has been. Consequently

no Christian can, without compromising his principles, support the "British stage." This opinion is supported by the following reasons:—

1. The principles and tone of the "stage" are—theoretically and practically, intentionally and professedly—of a secular, and not unfrequently of a sinister character. To obtain money and applause, to please the senses and gratify the morbid cravings of a depraved nature, is the design of the "British stage;" whereas the principles of a Christian are set forth in such passages as these:—"Love not the world, neither the things *that* are in the world. If any man love the world,

the love of the Father is not in him." "The friendship of the world is enmity with God." "Be ye spiritually minded." "The carnal mind is enmity against God." "To be carnally minded is death." "Have no fellowship with the unfruitful works of darkness, but rather reprove them."

2. The stage is, in its tendency, "earthly, sensual, and devilish"—designed to allure the unwary—calculated to neutralize the religious effects produced in the minds of the young at our Sunday and other schools. That these ruinous effects may be secured, no expense, labour, or risk is spared. Finery and farce, *ad infinitum*, are resorted to by managers and actors. Hence thousands of pounds are expended to furnish the theatrical wardrobe of a first-rate actor, and twelve or fifteen hundred pounds are jeopardized on a single night's performance. Now the injunctions upon a Christian are these:—"Give me thine heart." "Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy strength, and with all thy mind." "No man can serve two masters." "Lead us not into temptation." "They (Christians) are not of the world." "Set your affections on things above, not on things on the earth."

3. The stage is attended with indecent expressions, licentious gestures, and immoral suggestions. In proof of this we might refer to numberless plays, with many of which our readers are, undoubtedly, familiar. But, to give weight to our argument on this delicate point, we shall make an extract from a work* whose author, though a minister of the gospel, was an advocate for the "British stage." "It cannot be denied," says he, "but that it has been long the fashion, and which has lately grown to a rank excess, to contaminate the language of the drama with a mixture of ribaldry and obscenity, and a profusion of all the contemptible equivocations of indecency. For these no excuse can be pleaded; they tend directly to corrupt the heart and to vitiate the moral sentiments. They profane the sacredness of modesty, and they wither that nice sensibility to the blush of shame which, when on particular occasions it shows its delicate tints on the cheek of youth and beauty, is inexpressibly captivating." Such

is Fellowes' picture of the "British stage," and, as one of its christian patrons, he would undoubtedly give it in its best colours. Contrast this picture with the following words of holy writ:—"All that is in the world—the lust of the flesh, and the lust of the eyes, and the pride of life—is not of the Father, but is of the world." "Mortify your members which are upon the earth; fornication, uncleanness, inordinate affection, and evil concupiscence." "Pure religion is this—to keep himself unspotted from the world."

4. The principles of the stage are derogatory to God, inasmuch as they profane, take in vain, and blaspheme, his holy name. The Christian is taught otherwise:—"Thou shalt not take the name of the Lord thy God in vain." "Swear not at all." Conscious that this was an evil calculated to bring down the curse of God upon this nation, an act* was once passed by the British legislature to prevent its continuance; and, if we are not mistaken, the said act remains in unmitigated force to this day. We subjoin the following extract, which alone will negative the question at issue:—"Be it enacted by our sovereign lord, &c., that if, at any time or times after the end of this present session of parliament, any person or persons do or shall in any stage play, interlude, show, &c., jestingly or profanely speak or use the holy name of God, or of Christ Jesus, or of the Holy Ghost, or of the Trinity, which are not to be spoken but with fear and reverence, shall forfeit for every such offence by him or them committed, ten pounds, the one moiety thereof to the king's majesty, his heirs and successors, the other moiety thereof to him or them who will sue for the same in any court of record in Westminster, wherein noessoine, protection, or wager of law shall be allowed." Other acts of the same nature have been passed at various times in the British parliament to suppress the dangerous tendency of playhouses, &c. But hitherto all have proved abortive, as the present existence of the noxious nuisance testifies.

5. The playhouse is the rendezvous of libertines and strumpets—the hotbed of lust and profligacy; while the principles inculcated upon Christians are:—"Depart ye, depart ye; go out of her; touch no unclean thing." "Be ye separate from sinners." "If

* "A Picture of Christian Philosophy," p. 136. By R. Fellowes, A.B., Oxon.

* 3rd Jac. I., cap. 21.

ye live after the flesh, ye shall die." "Let him that thinketh he standeth, take heed lest he fall." "Blessed is the man that walketh not in the counsel of the ungodly, nor standeth in the way of sinners, nor sitteth in the seat of the scornful." "Can a man take fire in his bosom, and his clothes not be burned?" "Can one go upon hot coals, and his feet not be burned?"

6. The stage, to say the least, has the "appearance of evil;" whereas the Christian is to "abstain from all appearance of evil." To take the most liberal and verbal view of christian principles, the stage is of doubtful character. This is not *our* opinion only, but the opinion—the best opinion—that can be formed of the stage by those Christians who support it. Even the question under discussion endorses this opinion. Now, whatever is doubtful, whether in nature or tendency, cannot be supported by a Christian, nor by any man, unless it can be demonstrated to be right for a man to drink the contents of a cup in which he suspects there is poison. Joshua-like, Christians must be decided to serve God. What, then, can be more palpable than the incompatibility between the principles of a real Christian and those of the "British stage?" And how it is that those men who dogmatically insist upon sponsors "promising and vowing" that their god-children "should renounce the devil and all his works, the vain pomp and glory of the world, with all covetous desires of the same, and the carnal desires of the flesh, and not follow nor be led by them," can be the foremost of those who frequent the playhouse, we cannot divine.

7. There is another reason, of a somewhat more philosophical character, which confirms our opinion on this subject. It is this:—If the stage be perfectly congenial to, and the natural element of, the most sensual and violent passions and cravings of the human mind in its unregenerate state, how can it please and merit the patronage of the same mind in its regenerated and sanctified state? The Christian is one who has "put off the old man with his deeds." Once he was "in darkness, but now he is light in the Lord." He has become "a new creature; old things are passed away; behold, all things are become new!" And his theme now is:—"Yea, lordless, and I count all things but loss, for the excellency of the knowledge of Christ

Jesus my Lord." If the abandonment of the stage be not one of the leading features in a converted man's life, what is? And if a converted man—a Christian—can, consistently with his principles, support and patronize the "British stage," what is it that he cannot do?

"As by the light of opening day
The stars are all concealed,
So earthly pleasures fade away
When Jesus is revealed."

Stage-playing was repudiated by the more enlightened heathens, as the following extracts testify. Seneca, the moralist, says:—"Nothing is more injurious to morality than attending upon such amusements; for by these means vice, through the medium of pleasure, insinuates itself into the mind." The Romans, according to Tully, "counted all *stage-plays* uncreditable and scandalous, insomuch that any Roman who turned actor was not only to be degraded, but likewise, as it were, disincorporated and unnaturalized by the order of the censors." And "a theatre" which was building (A. C. 599) was, by the appointment of the censors, ordered to be pulled down, as a thing hurtful to good morals." If such were the sentiments of heathens, the children of the night, what ought to be the sentiments of Christians, the children of the day?

We regret that those persons who have taken an affirmative view of this important question have not had recourse to the word of God for proofs in defence of their position.

C. W.'s argument, that the "British stage" originated from religious motives, proves too much, for supposing it thus originated, he must allow that it has been wholly diverted from its first purposes. Hence the stage has become another thing; consequently, the arguments which justified its adoption will not justify its continuance. Their weight is thrown into the other scale. But, if we wish to benefit by the tragical and comical follies of others, let us turn our attention to another quarter, for—

"All the world's a stage,
And all the men and women merely players."

J. F.

By permission of the editors I would take this opportunity of cordially and conscientiously recommending to the perusal of every

* Adam's "Rom. Antiq.," p. 329.

young man interested in the mission of the *British Controversialist*, a pungent work on the temptations of the young, written by the Rev. H. W. Beecher, entitled, "Lectures to Young Men," and published by Hamilton, Adams, and Co.

AFFIRMATIVE REPLY.

X "The finest exhibition of talent, and the most beautiful moral lessons, have been interdicted at the theatre. * * * Where is every feeling more aroused in favour of virtue than at a good play? Where is goodness so feelingly, so enthusiastically learnt? What so solemn as to see the excellent passions of the human heart called forth by a great actor animated by a great poet?"—SIDNEY SMITH.

X THE more important the question, as a general rule, the greater the diversity of opinion upon it; and, where religious enthusiasm can be brought to bear, that diversity will generally be much more amplified, and the ardour of the disputing parties increased. Being perfectly cognizant of these facts, and being likewise more desirous of giving encouragement to the free expression of opinion than of retarding it, we have nothing to regret in the part we took in the introduction of the present question, nor have we been disappointed at the subject eliciting greater warmth of feeling than is generally manifested in these pages. But to our task.

On introducing the question of the stage, we imagined that in all fairness we should rather keep in view its legitimate position and influence, than treat it under the adverse circumstances by which neglect and corruption have surrounded it. The subsequent affirmative writers have seemed also to appreciate this line of argument, and have adopted it. On the contrary, the negative writers have found it would best suit *their* purpose to deprecate this mode of procedure—to put prominently forward the abuses of the stage—to impart to the whole argument a strong *religious* tone and colouring, and to make hard hits at those whose opinions are contrary to their own. Well, after all this we are not dismayed. We may have erred in our judgment, and *may* have to suffer the defeat consequent thereon; but there is yet one consolation, and it is this—that, if we have erred, it has been in good company; for we have the testimony of the greatest writers of the greatest nations in favour of the beneficial influence of well-planned dramatic representations; and nearly the whole band of poets—ancient and modern, living and dead—join, either in letter or in spirit, in

the same declaration. But we must descend more to details.

"Aristides" is the first with whom we join in debate. Passing over, for the present, his argument, that the stage is not a representation of society, and has no counterpart except in the mind of the author, which we unhesitatingly deny, we would inquire for an explanation of the following sentence which occurs in his paper, near its close:—"We are debarred from having that *higher order of theatricals which might be beneficial*; and, so long as theatres are directly dependent on the public for support, so long must *inferior* theatricals prevail, for the few only can appreciate *intellectual theatricals*." What are we to infer from this sentence? or what is its common-sense translation? "Aristides," it may be unwittingly, but certainly *very clearly*, admits the *possibility* of a "higher order of theatricals;" and he certainly also admits their *desirability*, by using the words, "*which might be beneficial*!" If there is a probability of their being beneficial, it is desirable they should be tried. No one will deny this. And, to make it more clear to his readers that he is perfectly in earnest in this belief, "Aristides," at the close of his sentence, refers distinctly to "*intellectual theatricals*." But then, of course, "Aristides" is labouring under a mistaken notion! There is no intellectuality in theatricals! Oh, no! they are all abominations! designed to ensnare, engulf, ruin, and undermine all moral and intellectual aims and ends, and sanctioned only by those who are debased below the common level of their fellow-creatures! Wherefore, then, such allusions? But stay! Supposing that "Aristides" *should be right*, and that there really might be "*intellectual theatricals*"—or, in other words, that theatres may be made places for intellectual culture and intellectual improvement—how would our Paritane friends be affected under such circumstances? We apprehend that the same dictate which says unto other men, "Get wisdom"—"Seek knowledge and understanding"—"Cultivate and improve the intellect"

which God has given you," would them, and that *they* might, as *con-* as other men, adopt the means now consideration, and the *inconsistency* rather "in the breach than in the ice!" We believe "Aristides" is The true drama has a decidedly *mal tendency*. We do not for a moment suppose that "Aristides" intended to cause such efficient service; it is one instances in which "zeal overshoots"; nevertheless, we are equally indebted to him for his unintentional good

ext writer who claims our notice is, who, after some just remarks, with an air of self-satisfaction, "What quality is discoverable in envy? Christian grace in malice? What virgosity in jealousy?" Surely the answer cannot be in earnest! Does he for a moment suppose that envy, malice, or jealousy introduced upon the stage to find in the eyes or ears of the auditors? as a more mistaken notion! In all the plays the characters who excel in one or more of these particulars invade us to an ignoble and infamous end. Now add that the reason of the introduction of these debasing passions into plots and histrionic entertainments is the purpose of "showing virtue her own scorn her own image," and deterring who witness the evil resulting from passions from falling into the like? We E. P. will, in future, have a better understanding of the subject.

us, after all, to have been left to administer to all insane believers in the merits and mission of the stage the reputation which they so richly deserve; and us (the unfortunate C. W., Jun.) seems to have descended heaviest. That we, in the exercise of that power of thought and expression belonging to men, should have dared to defend a position which "ever has been, is now, will be," demoralizing and debased—added forth the lamentations of the biographer, Johnson—and which, so as the days of the Monarch of the age, the busy brains of Master Wilkie, not to abuse, but to chronicle of those who had performed *that* in his time! Or, again, that we

should adopt anything which had been originated by the clergy, or which had been devoted to the purposes of religion. Detestable source for even the meanest advantage to spring! In these days of boasted toleration, to think of tolerating an institution upon such a plea! Excommunication, without benefit of clergy, would be far too good for us! Yet we are prepared to stand by what we have written. It is not yet proved to our satisfaction that there is anything in Dr. Johnson's writings upon which to build an argument against the stage; and, as to Mr. William Prynne, had we time we could very considerably reduce the formidable appearance of *his* efforts to cast obloquy on the drama.

Turning to Johnson's "Progress of the Drama," we find the opening stanza to consist of a tribute to the memory of Shakspeare, the greatest hero of the stage:—

*"When learning's triumph o'er her barbarous
foes
First rear'd the stage, immortal Shakspeare
rose.
Each change of many-coloured life he drew,
Exhausted worlds, and then imagined new.
Existence saw him spurn her bounded reign,
And panting time toil'd after him in vain:
His powerful strokes presiding Truth impress'd.
And unresisted passion storm'd the breast."*

He does, indeed, lament that the public taste sometimes induced managers to lower the standard of their performances; but furnishes the following just apology:—

*"Hard is his lot that here by fortune placed,
Must watch the wild vicissitudes of taste:
With every meteor of caprice must play,
And chase the new-born bubbles of the day.
Ah! let not censure term our fate our choice,
The stage but echoes back the public voice;
The drama's laws the drama's patrons give,
For we that live to please, must please to live."*

And he concludes by reminding his readers that it was for them

*"to bid the reign commence,
Of rescued nature and reviving sense;
To trace the charms of sound—the pomp of
show—
For useful mirth, and salutary woe;
Bid scenic virtue form the rising eye,
And truth diffuse her radiance from the
stage."*

Let W. T. and "Aristides" digest these lines!

With regard to W. T.'s challenge for us to "point to a single individual who ever became a more moral man by witnessing the representation of vice," we will endeavour to

X perform the bidding. If our friend will turn to the life of George Colman, who was very excellent in the character of *George Barnwell*, he will find it narrated that Coleman once received a *fifty pound note* from a person unknown, accompanied with a letter begging his acceptance of it as a token of the writer's gratitude, *who was some years ago saved from destruction by seeing him perform the part of Barnwell in a tragedy of that name!* We venture to say that other instances are on record; but, as we are asked only for one, we need not give more. The great Shakspeare himself says, in *Hamlet*:—

“I have heard
That guilty creatures, sitting at a play,
Have by the very cunning of the scene
Been struck so to the soul, that presently
They have proclaimed their malefactions.”

Let those who build their argument on assertions only, remember they stand on dangerous ground.

“*Adelphos*” in the last number, and in the present, follow in much the same way as their predecessors, and therefore require particular attention.

Several points to which we had intended to have made allusion are already anticipated by D. H. in the preceding paper; we now, therefore, only to express a hope that those who adopt our views as to the legitimate purposes of the stage will endeavour, by the means in their power, to purify and to make it *less* the slave of fashion, licentiousness, and more the receptacle and preserver of great thoughts and pure

C. W.,

NEGATIVE REPLY.

THE papers on the affirmative of this question are of an apologetic, instead of being of a defensive, nature. The writers in common admit that the British stage is in a corrupt state, but maintain that Christians, having neglected it, are themselves to blame; and the question they have discussed is, “May theatrical representations be made conducive to morality?”—one which few will be hardy enough to oppose. We will not grant them that the debate should be so construed. The British stage has a large constituency, among whom are many intelligent and christian men; and, as it cannot be supposed that these render it their countenance and support unreasoningly, we expected to have had the arguments by which these had satisfied their consciences of the propriety, or rather the righteousness, of their course. We cannot, however, admit a change in the terms of the debate, as it is not some ideal, nor what a future age may call the British, stage with which we have to do, but what actually is at the present day.

We are nearly at one with our opponents as to the value of theatricals, abstractedly considered. If it were possible to separate the stage from the present attendant abominations, it might be an institution calculated in an eminent degree to exalt the character; but such a title cannot be claimed for it *until it has undergone a radical change.* It

is forced into a stricter observance of the amenities of social life now than here for the people, despite its pestilent influence; but have attained a higher morality; but time has been when lady visitors, on the introduction of a new play, lest it might be of an equivocal character, were in the habit of wearing masks. What else, indeed, could be expected? At that period both actors and players were beneath the standard of morality of other men, low as that was. Theatrical representations are within their sphere when exhibiting the more lovely qualities of man's nature, and are, in that case, calculated to exert a beneficent influence on the auditory; but that sphere is not extended when the less amiable traits are placed there; for, though it may be argued that it is not acting faithfully to nature, and we thereby lose, in variety of character, the moral lessons conveyed by representations in which these disfigurements of nature are even granted that the vicious expiations of poetical justice, are not a whit more than those of our public strangulations. The support of good men need not be extended till this change has been effected.

We can examine only one or two statements of the opposing writers. The first compels us to be brief, else, as the matter abounds in other papers, ours would extend to a considerable length.

C. W. writes:—“Nor shall we en-

say that the results of such teachings be 'to raise the genius and amend the it.' Will the writer pardon us when we that we consider this as merely a waste betoric, as he himself, a little way further states that the stage "is *now*, in many acts, *far different* from what he would e it to be." The statements are clearly contradictory; for if it has retrograded, as intimates it has, it is impossible that its such as he states could have accrued the teachings to be had there. But stage is, in truth, now more healthy, ally, than it ever has been before. On point our able coadjutor, W. T., has ady done himself honour. We shall endeavour to show that it is not compatible the nature of the stage, as at present ducted, to produce the results claimed it by C. W. The object of those who the stage is, professedly, amusement. intellectual only unite the desire to with that of being entertained. Now, entertainment provided is an index of prevailing taste. for it is not the interest managers to foist on their audiences never may please themselves, so that the liar likings of the frequenters are so oughly studied that the performances, in effect, be said to be of their own eing. One would think, if the facts as stated by C. W., the performances needs be of a strictly moral, if not of eligious tendency; but, to a considerable at, the reverse is the case; so much so, many of the most popular plays, while lured attractive by their sparkling wit their humorous incident, are founded on ritories, such as illicit amours, &c., and are very far, removed from genuine morality. cannot go along with C. W. in thinking t this contributes to the enlightenment be mind, the correction of the heart, the ifying of the affections, or the government the passions. The very retentiveness ch, as he remarks, characterizes the mind egard to that which we see, renders the- ical representations all the more dan- us; for the thoughts reverting, as they a must, to scenes in which "moral nacy" is interblended, but aggravates perpetuates the evil.

Although the immorality of the stage is,

as H. T. remarks, incidental, that it still deforms the plays will not be denied; and this, taken in conjunction with the other fact, that in the theatre are to be met the depraved and designing of both sexes, who are always ready to mislead, renders it exceedingly hazardous to those whose characters are as yet unformed. A Christian, however, is not at liberty to tamper with temptation, and his refusal to visit the theatre does not argue any want of "moral restraint," or any neglect of responsibilities, but argues that, from a strict regard to principle, he has determined that, in this particular, he should not be ranked with those who are "lovers of pleasures more than lovers of God." We do not say that those frequenting the theatre must "necessarily fall into loose habits;" but that their position is extremely perilous we think we have clearly established. In view of the circumstances stated, how inconsiderate is the ridicule of H. T., when he says, "the Christian who cannot run the gauntlet of a visit to the playhouse may be benefited by considering the phantasms that bewitched the saintly hermits of old in the seclusion of deserts."

"All morality (says H. T.) is akin, whether contained in 'Bentley's Minstrel' or the Bible." We should have liked him to have pointed out the correspondence between the morality of the playhouse and the Bible. He meant us to infer that they, also, were alike. This is a position which Christians can never yield; and he who should give countenance to any code of morals other than that contained in the sacred writings is unworthy to be ranked among them, because, besides doing violence to the principles he professes, he insults the great Author of his being. The morality of the stage wants the religious motive, the grand distinction between christian and human morality.

We quote from one of our weekly serials the following pertinent remarks:—"A national drama should be all beautiful; deformity should never be legitimized by the sanction of a name; vices ought never to be permitted to steal in under the patronage of talent; and, above all, the worship of individual reputation should never be suffered to deprave the taste and corrupt the judgment of the public."

Philosophy.

IS WOMAN MENTALLY INFERIOR TO MAN?

NEGATIVE ARTICLE.—III.

THIS is a great and interesting social question. On the verdict of general judgment upon it depends very largely the social position of the fair portion of creation. One great feature of that position is universally recognised in the civilized world: claims for the other have been only recently heard. The long unquestioned occupants of the Downing-street of the heart—the ladies—are now in many quarters advancing their claims to a share in the guidance of the head. We are inclined, while admitting the absurdities into which many advocates of the "rights of woman" have fallen, to move that the petition be taken into consideration; and we have a strong suspicion that, if the petitioners were themselves "heard at the bar" of the *British Controversialist*, the negative of the question would be *ipso facto* proved.

What, we are entitled to ask at starting, is the *necessity*—moral or otherwise—for mental disparity between the sexes? Where is the natural law upon which we are bound to receive it? Is human happiness and social harmony more secure on this than on a contrary assumption? Is man able to do more for the world alone than man and woman together? But, not to pursue further inquiries, each of which suggests a puzzling successor, there are several positive difficulties in our mind in the acceptance of the inequality theory. It appears "very like" the affirmation of a second order in creation. It is possible to conceive of many differences of another kind without involving any such distinction: but a difference in *mind* is fundamental; it is the grand feature of humanity, which separates it from lower tiers of being. We can understand, too, the existence of variations and inequalities in the male and female mind to a great degree; but when we are told that they spring from inherent necessity—that the one, *as a sex*, is superior, *because* it is male; the other, *as a sex*, inferior, *because* it is female—we hardly know how to escape the inference that the one is a lower, although a similar, race than the other.

To draw another argument from analogy—that of the universal law of compensation, which in the animal world has afforded so much employment to naturalists, and so much interest and instruction to others. On this principle we should expect to find inequalities in one direction balanced by beauties or advantages in another. Regarding mankind physically, we find the law to hold good. Man challenges the pre-eminence in strength and vigour, woman in beauty and grace. Morally, too, man is distinguished for the sterner, woman for the gentler, impulses. But viewed mentally, if woman be inferior here, where lies the compensation? How is the balance adjusted? Is nature at fault? or is the disparity theory wrong? Again. For what is man, as an intellectual and moral agent, eminently constituted? For society. For what, as an *individual*, is he constituted? For society—*individual* society—with a view to mutual effort, encouragement, and co-operation. Such co-operation it does not admit of a doubt, is intended to extend to the higher elements of nature. Besides the more obvious designs of such society, it has the laudable and sacred end of united moral action and united mental exertion, each helping and animating the other in the struggle of responsible existence, each leading the other onward and upward. But if in this latter exigence woman fail, and that, too, from a necessity of her being so, how powerful and beautiful a charm is destroyed! She participates the battle with man with the realities of life; she divides with him its vicissitudes and its cares; she shares his sympathies and affections, his hopes and fears: but now, in the most arduous and the most important phase of his exertions, man is left alone! The "help meet for him," pronounced to be so upon the highest authority, fails him, when, at such events, as deeply needed as before—cannot understand, counsel, or advise, requires itself to be led! And such a position robs it almost as much of its charm

as of its value. The mind ceases to love what it is obliged to despise. Men have partners that cannot sympathize with, perhaps, two-thirds of their nature. It is true that, on any supposition, many must incur that misfortune; but, on that of inherent female inferiority, very few can be otherwise situated: the vast majority must be linked with beings of a lower mental grade than themselves. To our apprehension such a circumstance would involve a not insignificant deduction from the felicity even of primeval Eden. But if it would be unfortunate for man, would it not be no less unjust to woman? Is it not unfair to deny her, *as woman*, even to any extent, her due share in those pleasures of the mind which are so justly accounted the chief pleasures of an immortal being? You admit the happiness of a highly-cultivated mind; and yet you deny that happiness to woman, or, at least, claim for man the greater share.

"But are male and female intellect, then, radically the same?" By no means. That there are differences, it were as absurd as it were vain to deny. The gist of the controversy lies in the question, whether the differences are those of disparity or of diversity. We believe them to be the latter; and we think the losing sight of the just distinction between the two is the cause of much of the misconception which prevails. The same test is applied to feminine as to masculine mind, and the result is, that the former is declared to be found wanting. No wonder. But this is unfair. In harmony with the principles which govern all the works of God, the mind, no less than the other features, of the constitution of man and of woman respectively, whilst characterized by a beautiful harmony, are also distinguished by peculiarities suited to the individual character and the mutual relations of each. Their differences are those of working, rather than of essence. We do not contend that the chariot of intellect, which, guided by man, flies so swiftly, and reaches oft so distant a goal, shall precisely in the same manner pursue its course when a feminine hand holds the reins; but we do contend that the chariot is there—that the steeds are as fleet and the wheels as powerful: and that, although the track it follows be diverse, there is nothing to hinder the same goal being reached. All, as it appears to us, that the advocates of sexual

mental disparity can prove is, that there exists no necessity for female intellect to flow in the same channels and assume the same contour as male intellect—that the mental stream assumes varied colours from the fields and skies through and under which it winds, and not from any deficiency of proportion or of depth in itself.

It is not uncommon to refer, in support of the contrary view, to the primitive curse upon woman, and its predicted consequences. There is here some appearance of plausibility; but reflection has convinced us that inferences of an opposite nature are quite capable of being drawn from the same source. On a comprehensive view of the scripture narrative, the subordination of woman to man would seem to be rather a *special* than a *natural* order of things; less a consequence of the respective peculiarities of the sexes—which it would have needed no divine intervention to point out, and which would have possessed none of the features of punishment which, as it is, seems properly to belong to it—than a subjection *ordained* on a special occasion and for a special purpose. The very occurrence, indeed, of such an incident in the sacred records appears like an indication that no such subjection had previously existed—that there had been no disparity, and no inferiority; and it will not, we presume, be said there is any reason for concluding that causes have been in operation since the event referred to, to induce dissimilarities which had no existence before.

The tribunal, however, to which appeal is most usually and confidently made is that of *fact*. It is notorious, we are told, as by "Senoi," that, with whatever degree of feasibility you may theorize, as a matter of fact, women are *not* mentally equal to men. Before offering some reasons for rating these facts at a less value than would otherwise attach to them, we will venture to dispute that, notwithstanding these reasons and their grounds, the facts are *not* so conclusive as they are affirmed to be. We have not left ourselves time or space for the details which might otherwise be given. Without accepting the press—so often in similar controversies appealed to—as a complete and certain index of the current social mind, we think we could name those whose *published* works, in history, poetry, art, religion, and even science and metaphysics, demand for their

authoresses niches in the temple of fame of no mean order; whilst we believe it would be impossible to estimate how much clear, pure, and healthy thought is unostentatiously contributed to the aggregate by the female mind, and how much we owe some of the most vigorous minds that have enlightened and improved mankind to the unnoticed but powerful vigour of intellect and soundness of judgment of those whose guidance was the unseen spring of their greatness. But it seems to be scarcely fair to appeal in the matter—that is, as exclusively—to existing fact. Besides the diversities before referred to, and the misconceptions to which they may give rise, it is only reasonable that the wretched degradation to which, for so many ages and in so many quarters, woman has been subjected, should be taken into account; and that it should further be remembered that, even in civilized Europe, the character of female education has been the least calculated to develop the better and greater energies of the mind. Surely, when we contemplate the pitiable mockery which has, till recently, been dubbed “female education”—the pettinesses and peccillities of which it has been

made up—the sedulous but somewhat uncomplimentary considerateness with which all that is great in knowledge has been kept out of their way, as though beauty were all the more beautiful for lack of brains—in short, the science which has contrived to substitute as the complete idea of a “lady,” for an intelligent and thinking woman, a well-bred doll—the wonder in the reflecting mind must be that any have been able to emancipate themselves. A better feeling is happily spreading, and woman is being treated as something more than a piece of waxwork, to be simply admired and amused; and with the spread of the feeling will be the spread of the happiest results. Woman must ever be less prominent than man: the rules by which the intellect of the one and the value of its manifestations are gauged, can never be applicable to those of the other, but no less will these latter have an influence as great in their sphere and as little estimable in their fruits; no less will all that is great and holy and beautiful in man largely and widely owe its being to her who is at once the star of his darkest hour and the sunshine of his sunniest day.

J. S. J.

AFFIRMATIVE ARTICLE.—III.

It must be acknowledged that the question upon which we are about to express an opinion is one that is very difficult of solution—the parties of whose mental constitution we are about to write are so differently situate, their education is, for the most part, of so diverse a character, and the duties that they are called to perform are so entirely dissimilar, that it requires more than an ordinary amount of discrimination and care to decide on the matter. In proof of the foregoing it is necessary to do little more than direct attention to the following considerations:—

The present relative state of the sexes is no proof of their natural inequality. Consider the state of the education of our female population, when compared with that of the males. Girls are kept from school by their parents on a variety of pretexts, for which boys would not be kept. Hence they do not derive near so much advantage from the schools which are provided for them as they otherwise might do, nor so much as boys do from similar schools.

Then it must not be lost sight of, that the schools which are provided for females are in many respects far inferior to those that are provided for boys. Many of the teachers of our large public boys' schools have had the advantage of a university education, which none of the teachers of female seminaries have had; while the male teachers of other schools are, perhaps, equally in advance of those of female schools of the same class.

If we consider, further, the efforts which have been put forth for the development of mind in young persons, as mechanics' institutes, debating societies, fraternal associations, and the like, we find that they have been established and carried on with a view to the improvement of young men. The benefit which women have derived from such efforts have been almost entirely confined to the books which they may have read from the libraries usually attached to such institutions.

Now, whatever may be our views of woman's capacity when compared with that

of man, we cannot but deplore either the utter neglect with which her education has been treated, or the flimsy character of the education which she has received. It is, indeed, to the credit of the sex that, though labouring under such disadvantages, there have been found some who have been able to wield the pen and govern empires. These, however, have been exceptions to the general rule; and, when compared with similar persons of the other sex, we find them few and far between.

After reading the foregoing it may easily be imagined that we are not satisfied with that method of deciding this question which would compare the mental achievements of man with those of woman. If women were educated in literature, mechanics, or science, to the same extent as men, it would not be unfair to draw the comparison, as "Senoj" suggested. As it is, however, the case is entirely different. It would be quite as reasonable to suppose that an engineer should be able to overlook and manage the arrangements of his kitchen, as that his wife should understand his mechanical inventions. There is another source of difficulty under which we labour in attempting to decide the question before us. We do not know the exact amount of intelligence which is displayed in the highest works of either men or women. Perhaps there is as much intelligence displayed in the designing and execution of some exquisite pieces of needle or crochet work as there is in the invention of many pieces of machinery. Nor is it fair to compare the utility of the one with the utility of the other, inasmuch as women have, by education and custom, been carefully shut out from works of utility beyond those of the kitchen or the house. Again, perhaps, it would be unjust to woman to suppose that, because we have no long list of inventions in mechanics to which her name is attached, therefore she is altogether devoid of mechanical genius; for, such is the kindness of her nature and the benevolence of her disposition, that it is more than probable that a husband or a brother has oftentimes taken the credit of that which is really her own, while she has been ready to remain in her native obscurity, quite content if those whom she loved were honoured by the world, the "kings of the creation," meanwhile, have

been perfectly ready to rise to fame on a woman's labours.

If, then, for the reasons already stated, we cannot judge of woman's mental ability as compared with that of man, by her labours as compared with those of men, the question is very naturally suggested,—How do we arrive at the general conviction that woman is inferior in mental ability to man? We answer—

1st. Woman was taken from man. This circumstance, of itself, would certainly not imply superiority.

2nd. Woman, from the time of the fall, "at least," was placed in a position of subjection to man. See Gen. iii. 16; 1 Cor. xi. 3. Now, it is customary for the weaker to be placed in subjection to the stronger, and not the stronger to the weaker. The very circumstance that *God* has placed the woman under subjection appears to be proof of man's superiority in mental power. To say that man has gained and retained his superiority over woman through his greater physical power is nothing to the purpose, for it is well known that *mental power*, when associated with *physical weakness*, is more than competent to deal with *physical power* when associated with *mental weakness*.

3rd. This arrangement of the Divine Being, as stated in scripture, is fully borne out in nature. Even in educated families this may be seen in the amount of deference which is paid by sisters to the opinions and wishes of a brother, provided he has been guilty of no moral delinquency, or is subject to no mental disease; by the manner in which women generally defer to the opinion of men in matters which do not belong to their own particular sphere of labour; and by the general wish of young women to have some one upon whom they can depend rather than whom they can rule.

If women sometimes meet with men who are not mentally their equals, and whom, as a consequence, they are obliged to rule, it is not a matter of choice; they would prefer, generally, that the husband should be acknowledged superior to them in mental capacity, in order that they might repose on his judgment rather than rule it. According to the natural order of things, however, the greater mind must rule the less—the less must be ruled by the greater. U. M.

Politics.

OUGHT MONEY TO BE INTRINSIC OR SYMBOLICAL?

INTRINSIC.—IV.

I HAVE read with much interest the articles which have appeared on both sides of this debate, and I feel sure that they will give your readers an intelligent view of an important subject that is little understood; at the same time, I could have wished that the writers had taken a wider view of the question, and been more definitive in its treatment. It may not, therefore, be out of place for me, without entering into the heat of the controversy, to offer some additional information that may be of interest to your present readers, and render your work still more valuable for reference on this subject.

The term "money" is somewhat indefinite. Mr. John Taylor, the author of an "Essay on Money," says that the word *moneta* signifies a token, being derived from *monere*. He defines *real money*, as "*all those things which, in return for a sufficient inducement, are capable of being transferred from one person to another.*" Mr. Cobbett contended that only the precious metals can, strictly speaking, be called real money; but Sir Robert Peel added *legal-tender paper*. Colonel Torrens has supplied a number of valuable definitions on this subject that I would commend to the thoughtful attention of your readers:—

1. Money consists of articles possessing intrinsic value, and adopted by general consent as the measure of value, the medium of exchange, and the equivalent by the acceptance of which debts are liquidated and transactions finally closed. In all civilized countries, the articles adopted as money are the precious metals. The money of each particular country consists of pieces of the precious metals on which stamps are impressed by the sovereign authority, certifying that they are of a given weight and fineness.

2. Paper money consists of instruments possessing presumptive value, and rendered by law or custom measures of value, media of exchange, and equivalents, by the acceptance of which debts are liquidated and

transactions closed. The most perfect forms of paper money are notes payable on demand in the amounts of the precious metals which they purport to represent.

3. The term "circulation" denotes paper money, which, under the existing law, consists of promissory notes payable in specie on demand, and uttered to the public by banks of issue.

4. Currency is the term employed to express the aggregate amount of coin and circulation in the hands of the public.

5. Auxiliary money consists of those forms of credit by which money is economized, and a given amount of currency made to effect a greater number of transactions than could be effected by the same amount of currency without their intervention. Auxiliary money is divided into deposits and credits in the books of bankers, checks drawn against such deposits and credits, and bills of exchange and other negotiable instruments promising to pay in coin or notes specified sums at future periods.

6. The term, "media of exchange," comprises metallic money, paper money, and auxiliary money—circulation, deposits, credits, and bills of exchange.

Colonel Thompson gives a wider definition to the term currency, as being "anything which the inhabitants of a country are in the habit of handing from one to another as the instrument of purchase and exchange;" and in this sense it is generally used.

As others have already observed, various articles were used as money in primitive times, but many of them were destitute of those qualities of invariability of value, divisibility, durability, facility of transportation, and perfect sameness, which must have formed the reasons of all civilized communities employing gold and silver as money. At first, gold and silver would be taken to market in a rough state, and certain quantities would be given for certain articles; thus we read of Abraham ~~weighing~~ four hundred shekels of silver, and giving them

in exchange for a piece of ground purchased from the sons of Heth, Gen. xxiii. 16. As commerce increased, the trouble of weighing the metal in every exchange would soon be felt, as well as the difficulty of deciding as to its purity and consequent value, and hence, in process of time, the invention of stamping or marking, each piece with a *stamp* declaring its weight and fineness.

In the earliest periods, after the invention of writing, pecuniary engagements would be committed to paper. A short time only would elapse, before individuals having written engagements from others, would begin to present them in payment to their debtors. None would object to receive as money the promissory note of a man of known wealth, and hence the origin of symbolic money.

Those who advocate money possessing an intrinsic value, do not object to the use of a limited paper currency as supplementary to a metallic one. Our opponents may cry out on our behalf, "Gold! gold! nothing but gold!" but they do it unauthoritatively. J. H. may amuse himself by recommending that a merchant having a thousand pounds to receive, should be followed by a clerk with a wheelbarrow; and we have only to add that he who suggests the plan should perform the labour; and certainly it would be a very suitable employment for "a man of progress," as our friend evidently is!

One of the principal objections to gold being used for money, was its scarcity, and

now that the productiveness of the mines of California and Australia has demonstrated the futility of this, we are told by some that this productiveness will materially alter the price of gold, and seriously derange the relationships of property. To such we commend the following recent remarks of the *Times*:—"Gold constitutes the general measure of price, and is therefore the only thing that has not a price of its own. It is simply receivable at the rate mentioned; that is to say, when one man talks of owing another £3 17s. 9d., he means that he owes him an ounce of gold. To speak literally of money price of gold is just as if a person were to ask how much tea he must give for a pound of tea."

Thus many and various are the considerations which belong to the discussion of a question like this, and though much may be said against our present system, yet remembering the melancholy proofs which history supplies of the dangers and difficulties arising from tampering with the currency of a country, I, for one, would oppose any change unless the necessity could be shown to be great, and the utility to be evident. This determination I more strongly hold when I find perhaps the greatest of money-symbolizers, Dr. Franklin, living long enough to change his opinion, and to declare to posterity, "I am now convinced that there are limits beyond which paper money would be prejudicial."

SCBUTATOR.

SYMBOLICAL.—IV.

As a general rule, the value of commodities is determined by the amount of labour expended in their production and distribution. Then why not make labour (which thus gives value to all commodities), instead of gold (which is only one commodity), the standard or measure of value? Why not issue notes which shall represent an amount of labour equal in value to the money denomination put upon them, and thus prevent the greater or less *quantity* of one commodity (gold) from affecting the *value* of everything else? This might be done by fixing upon some certain quantity and description of labour, the *present* value of which is equal to the present pound sterling, or sovereign, and substituting it for the existing standard of 5 dwts. 3·274 grains of gold, and making it

the future *permanently fixed* standard; for a standard that requires "adjusting" cannot be a *correct* standard. If it be one thing to-day and another to-morrow, how can it always be an exact measurer of value? Take, then, the *present* value of the pound, as measured by the present value of some one description of *labour*, and let *this* be the future *unchangeable* pound sterling, whatever the future changes in labour or commodities; and, although labour or commodities then might rise or fall in price, it would not be from alterations in the currency, but from alterations in the quantity or value of labour, or in the commodities themselves. The currency would only show that their then value was so much above or below their value in 185—, when the currency was settled. What

I propose, therefore, is, that the pound sterling shall represent the value of a certain quantity and description of labour *at the time of the basis being fixed*, not that it would or could be made always to represent the precise value of that exact quantity and description of labour under every future change or aspect of that labour.

Suppose, then, we were to say that the present average value of unskilled manual labour is 2s. per day—ten hours' labour to the day. This supposition would serve well for a *decimal* system of currency, if a decimal system should be thought preferable to the present, for the pound sterling would then be the representative of the present average value of *ten* days' unskilled manual labour; the *tenth* of a pound, or a florin, would be the representative of the present average value of *one* day's unskilled manual labour; and the *hundredth* of a pound, or the *tenth* of a florin (or about 2½d. of the present coinage) would be the representative of the present average value of *an hour's* unskilled manual labour, &c. Thus the "pound in account" would be a tangible pound, and not an abstract term having no definite meaning or foundation at all. And the superiority of such a pound over the pound founded on or convertible into gold would be, that the currency would then be dependent upon no one particular commodity for quantity or value, but might be made perfectly fixed and steady in price, and always procurable in quantity or amount to suit the exact wants and necessities of the people under every phase or emergency of trade or commerce. But for the better accomplishment of this purpose, and for the national instead of individual benefit, a national bank of issue ought to be established, which should be the *only* bank of issue (except its branches, for convenience), and should be entirely free from all party control in the management of its issues, so that there might be no "tampering" with the currency. All existing legal-tender currency should be called in, and the national notes made the only legal-tender currency for the future, except small currency. And, in order that there may be no alteration in the present purchasing or legal-tender value of money *by the change of standard*, national notes should be given in exchange for existing legal-tender currency, at equal value. The notes thus issued in exchange for exist-

ing legal-tender currency should form the groundwork or body of the new circulation, or that amount or portion of the new circulation which the every-day wants and necessities of the people would require to be constantly afloat. All *additional* issues of national notes should be dependent upon the legitimate demands or requirements of trade or commerce, and should be supplied in quantity in exact accordance with those demands, whether that quantity be greater or less; or in other words, as your correspondent J. H. phrases it, "they should increase with production and disappear with consumption." To do this *correctly* the bank of issue ought to issue its *extra* or *additional* notes only by discounting good *bond fide* or genuine bills of exchange, and only where sufficient or satisfactory *collateral* security is afforded—the nature and description of security acceptable to be well and clearly defined—and the rate of discount, a uniform or fixed rate, say the present minimum rate of the Bank of England, or 2 per cent. per annum.

Thus the quantity of money afloat would always exactly adapt itself to the real wants and necessities of the people and the state of trade and commerce. When more money was wanted, as commerce expanded or bills became due, more bills would be discounted at the national bank of issue or its branches, and when less was wanted fewer bills would be discounted. The *extra* issues of the national bank would, therefore, simply be a substitution of cash, or legal-tender money, for bills of exchange; consequently, there could be no danger of over or excessive issues to act injuriously upon the currency, as bills of exchange (upon which the *extra* issues would be based) are themselves legitimate currency, being called into existence by the state of production and the actual demands of trade and commerce. But as, from their very nature, they are not adapted for legal-tender currency, a substitute for that purpose is required, which shall be equally as harmless in its effect upon the general quantity and value of money, as well as be always available or procurable upon uniform terms; and this I consider would be accomplished by a *really national* bank issuing notes, by way of discount, on good, genuine bills of exchange, as above. Perfect freedom of dealing and banking in the national issues

ought, of course, to be permitted, so that money might get properly and thoroughly diffused amongst the people, and that those who might not have the requisite means to obtain it from the national source of issue direct, might obtain or procure it through the instrumentality of others. Moreover, for the satisfaction and convenience of the public, as well as a detective check or security against fraud or forgery, the national notes should all be "convertible" at the national bank or its branches, not into gold at a fixed price on demand, but in lieu thereof, from larger to smaller amounts, or from smaller to larger, at the will of the holders. With such a system of currency and issue gold might be left as free as any other commodity to find its own natural price in the markets of the world; but, nevertheless, the certainty with which its comparative purity and genuineness can be ascertained by the skill of the assayer, and, consequently, its real marketable value known, might still point it out as a necessary and useful instrument in balancing foreign exchanges, until a better or more convenient medium could be agreed upon and adopted.

But let me here remark, that, with a correct system of *symbolic* currency, it is of little consequence *what* is adopted as the *standard* for the currency, provided it be of the same real and exchangeable value at the time of its adoption; for it is not the nature or *material* of the *standard*, but the *mode of issue* and the *conventional value* conferred upon the currency by making it the legal tender, that gives to it that *fixity of price* so essential in a measure of value. This doctrine may seem somewhat new; but, notwithstanding, I consider it the true one. The difference in value betwixt gold and notes, during the period of the late wars, I do not attribute to a depreciation of paper or notes, but to an *appreciation* of gold, owing to the "inconvertibility" of notes (and consequent conversion of gold into a commodity), added to the *then* extreme scarcity of gold as compared with the demand for it: the "inconvertibility" of notes was all that time considered a necessary step to provide a sufficiency of currency for carrying on the business of the country. Neither do I consider the then generally increased prices of goods to have been produced, to any considerable extent, by the mere fact of the

"inconvertibility" of the currency (and the possible "expansion" thereby created), but *mainly* by the enormous sums spent in carrying on the wars, which added so extensively to consumption and demand, without a corresponding increase in supply. As soon as these enormous sums ceased to be spent, trade collapsed, and prices fell. And this would still have been the case, ultimately, had the currency remained unaltered. But the alteration of the currency coming at or near the same time as the collapse, the alteration of the currency has got all the blame (though undeservedly) laid at its door. By the extraordinary demand for commodities above supply, created by the wars, prices had increased beyond their natural level. The reaction was, therefore, inevitable, sooner or later. It will hence be seen that I am not of that school of currency reformers who think that taxation can be added to price, by the issue of what they call "taxation notes." With a legitimate system of money issue, the prices of commodities must always be governed or regulated by cost, supply, and demand. The "taxation" principle of issue I consider a fallacious one, inasmuch as I can see no essential difference, in respect to the effect upon prices, betwixt a certain sum of money issued by the state, and taken back in payment of taxes, and the same sum issued by, or procured from, the Bank of England, or any other bank, and returned to it by the state, as taxes are received. If the amount of "taxation" money annually to be issued by the state were not to be called in, but allowed to remain *afloat*, and the yearly additions to its amount left to accumulate in the country, then I admit that such "taxation" money would affect the prices of commodities, just the same as did the annual issue and funding of large amounts of exchequer bills during the late wars. But the constant accumulation of the notes is not what the advocates of "taxation" money propose. Therefore, seeing that the professed object of issuing "taxation" notes, viz., that of adding taxation to the general prices of commodities, is incompatible with the means proposed for its accomplishment, I am at a loss to know what other advantages can be specially derived from that mode of issue. If it be sought to reduce the burden of the national debt, so that the present real value of the interest of

that debt may more nearly correspond with the real value of that interest when the debt was contracted, there is a more simple and effectual way of attaining that object. For instance, the minimum rate of interest at the Bank of England has ranged, within the last few years, from 2 to 8 per cent. per annum. The national creditors have, through all these changes in the value of money, been constantly receiving the same fixed sum as interest upon their debt. If, therefore, the national debt be a *money* debt, and *the price of money* should *hereafter* be *permanently fixed*, what is there to prevent the national debt being then made to correspond in value with money? that is, to have the same interest allowed as the national money would then be worth at the national source of issue. The national creditors have hitherto enjoyed the full advantages which inventive skill and ingenuity have exercised in diminishing the money value of all descriptions of goods and produce since the debt was contracted; consequently, although the interest of their debt might be *nominally* reduced by the above process, its *real* value would be as

great, or probably even greater, than when the money was lent. And what injustice could there be to the national creditors in giving them the same, or it might be even a greater, real value than that which was originally contracted for? It must be borne in mind that, under the circumstances supposed, the value of their debt would not then have to suffer from *fluctuations* in the quantity or price of money itself, the price of money, at its source, being then *fixed*.

I will now conclude by stating that I think the establishment of a good sound system of *symbolical* currency would be the most effective remedy for the present state of things in Australia. What is the physical and moral value of a few paltry tons of gold, compared with the disruption of society, and the breaking up of all the regular sources of wealth and industry in the country? If gold were "disfranchised" there would not be the same inducement for deserting other and more important callings for that of digging gold. Its price would be less certain, and the market for its sale more doubtful.

C. E. R.

Social Economy.

IS THE CONFESSIONAL IN HARMONY WITH INTELLECTUAL AND MORAL FREEDOM OR SOCIAL WELL-BEING?

NEGATIVE ARTICLE.—I.

No institution of the Roman Catholic Church is more cherished than that of Confession. It is to this that the church is indebted for its boasted unity; but if any other church, purer and more liberal in its principles, were adopting this as one of its tenets, defection from the mother church would immediately ensue. The fierce opposition given to the Episcopal Church in Ireland arises from this—it lacks the power to forgive sin. Did it possess the power of absolution, it would be popular. Auricular confession dates its introduction from 1215. Previously public confession was the only admissible form; but the affluent, that their character and their status in society might not be compromised by discreditable revelations, were granted the privilege of confessing

privately. This more agreeable mode brought with it a large accession of influence to the church: the clergy, ever alive to the interests of that, had it adopted generally. It was ratified by Innocent III., at the date above quoted. The requirements of confession are—sorrow for sin, confession to a priest, the performance of the penance adjudged: its purpose is—the reconciliation to God of such as have become alienated by sins committed subsequently to baptism. The Rev. Stephen Keenan (a Roman Catholic divine), in the "Controversial Catechism," p. 186, says:—"The penitent, to be absolved, must *detest his sins*; he must be firmly resolved to *avoid sin and its occasions* in future; he must be *willing to submit to whatever penance the priest imposes*; and, if able, he must *confess*

all his sins;" and, at p. 185, says:—"The sacrament of penance was instituted for the remission of sins committed after baptism." Every individual is bound, under pain of excommunication, to appear at the tribunal of penance at least once a year; but monthly, and even weekly, confessions are recommended as more meritorious; and parents are ordained to send their children so soon as these can discern between right and wrong: this faculty divides ascribe to them about their seventh year; the church has thus its members under its guidance from the most impressible period of life.

Penitents are required to accuse themselves of all mortal sins committed since their previous confession, beginning with the more heinous first. They must be very specific in their self-accusations, embracing every variety of sin, and narrating every concomitant circumstance, especially such as tend to aggravate the guilt of the sin. "If," says the Rev. Joseph Curr (in his manual—"Familiar Instructions in the Faith and Morality of the Catholic Church"), "a penitent omits one mortal sin in confession, or one about which he even doubts whether it be mortal or not, his confession is null and sacrilegious;" and the Rev. Mr. Kernan, before quoted, says,—"The priest is a judge who must decide what sins he ought to forgive and what he ought to retain: now, no judge can pronounce a decision without hearing the whole case." Should penitents hesitate, either from timidity or from bashfulness, to detail their transgressions circumstantially, the father confessor, skilled in ex-amination, can generally extort the concealed sin, if not by entrapping questions, by threats of spiritual terrors; this accomplished, contrition expressed, admonition listened to, and penance prescribed, absolution is granted, and the penitent withdraws, vainly believing his sins forgiven.

From the circumstance that the penitent submits the inmost secrets of his soul to his confessor—that he deigns to sue for salvation through his agency, although a man impotent as himself—must, we think, induce a servility of mind diametrically opposed to intellectual and moral freedom. Yet, to a man in that character the adherents of the Roman Catholic Church are commanded to intrust their reputation, and on his graciousness to hazard their hopes of eternal life. We say

hazard; for it must ever be remembered that the efficacy of absolution, even after an unreserved confession, depends entirely on the confessor; it matters not that the person confessed is of the most irreproachable character, meritorious in every respect, if, when pronouncing absolution, the confessor have not the *intention* of securing grace for the penitent, the confession has been of none effect. Of all despotisms, the despotism of the confessional is the most degrading, as by it the dependence of the sinner for mercy is transferred from God to man: it is, indeed, absolutism in perfection, when the fickleness of a priest can exclude from the joys of Emmanuel's kingdom.

It may be asserted that secrets confided to priests dare not be divulged. This fact does not, however, remove the evil. A man, on confession, must feel as if filched of his equality. This feeling priests are at no pains to lessen, but arrogate to themselves a proud superiority—a superiority no less than that of being the vicegerents of the Omnipotent. Confession is inimical to the wholesome self-respect of individuals. It is an institution which in no way exerts a salutary intellectual or moral influence either on priest or penitent; for, while it gives a fictitious ascendancy to the one, it detracts from the common manhood of the other.

The Romish clergy being celibates, not from choice but from compulsion, it is quite apparent that the power they wield is liable to abuse: to expect unwavering virtue under the circumstances would be to suppose them endowed with a superhuman morality. We must bear in mind that priests, although robed in canonicals, are nevertheless inheritors of human frailties, and as such fall before the like temptations with other men. They are the victims of a system which imposes on them unnatural restraints, and which, at the same time, subjects them to an ordeal to which the severest austerity is often unequal.

The confessional inflicts irreparable injury on man's moral nature. The majority are not vicious, as is assumed at that tribunal. In the process of eliciting the penitent's delinquencies, vices are rehearsed offensive to the commonest delicacy, and on these especially, in every phase, artful and insinuating interrogatories are put, for the avowed purpose of obtaining an "honest, fair confes-

sion." As a pertinent illustration of the questions proposed, we quote a passage from the "Poor Man's Manual," a Catholic book of devotions, which we chanced to dip into while in the house of one of the "faithful" the other day. In justice to ourselves we must say we had some scruples anent transferring this passage to the pages of the *British Controversialist*: we prevailed upon ourselves to do so only by the thought that the intelligent reader would perceive we were animated solely by a wish to place this subject in its true light. The passage occurs in the section referring to Preparation for Confession. On the sixth commandment (our seventh) we are to examine ourselves as to whether we have "Taken pleasure in unchaste thoughts or desires, or in the sight of immodest objects; frequented immodest plays; uttered or read, or given ear to or not hindered, immodest words, verses, discourses, books, or songs; touched myself or others, or kissed them unchastely; committed adultery, or any other impurity." Now, we submit that this very practice must vitiate the mind—must introduce it to the knowledge of vices previously unthought of. We have no doubt that the first immodest thoughts—calculated powerfully to influence the character—which occur to many a young person may be dated from the confessional. The questions are suggestive of the very thoughts, and words, and acts, which ostensibly they are meant to suppress. It is not to be supposed that interrogations such as these, addressed to youth under the accompanying solemnities of place, person, and circumstance, will readily be forgotten. No; the impression left will be indelible—will be retained in the memory, and pondered over, till thoughts of a kindred character become habitual to the mind.

From childhood to senility, all must submit to confession: the youngest are duly examined as to indiscretions of the blood;

and, according to their years, their examinations become more and more indecent, no matter whether the penitent be male or female; even married life enjoys no immunities from these execrable examinations; the insatiate confessor, with a painful interest, still perseveres in his ungracious offices. We can scarcely permit ourselves to venture another quotation from these devotional works. In the "Familiar Instructions," already quoted, Mr. Curr impresses on the minds of married penitents "That the debt of marriage, which each one owes to the other, cannot, without just cause, be lawfully refused, and that the party so refusing is answerable to God for whatever evil may ensue from it,"—very properly leaving the justness of the cause to be determined by the confessor. The prurient curiosity of the priest is gratified by prying into the liberalism of his parish: he seems to experience an ungodly delight in listening to detailed recitals of licentiousness. Let any one doubtful of this, peruse a few of their devotional works, especially the sections referring to confession, and we are satisfied he will be disgusted with the melange of piety and obscenity to be found. If afterwards he chooses a more minute investigation, let him peruse any of their institutes of theology, and he will conclude that no system could be devised better calculated to defile the minds of both confessor and confessed.

We have shown that the confessional is not in harmony with either intellectual or moral freedom: that it is not in harmony with social well-being necessarily follows. We have only further to remark, that man's actions, being governed by his belief, the Roman Catholic will be comparatively unscrupulous, seeing that he believes his sins to be cancelled by the absolution which follows confession and the performance of the penance prescribed. ARISTIDES.

AFFIRMATIVE ARTICLE.—I.

It cannot, I think, but afford satisfaction to every sincere friend of truth, to mark with what consistency you continue your efforts to place your readers in a position to pronounce an intelligent verdict upon every important doctrine and practice respecting which there exists a diversity of opinion. None can regularly peruse your magazine

without gaining much instruction and having many prejudices dispelled; and I fondly hope that it will be thus with respect to discussion of the confessional, upon which we are about to enter. I have no doubt that many of your readers regard this institution with feelings of dislike, and even detestation; but this, I venture to assert, is on acco-

d their partial information as to its workings, and the distorting medium through which that information has been received. I would, therefore, earnestly entreat them to endeavour to banish preconceived and prejudicial notions from their minds, and to come to the consideration of this subject with a true eclectic feeling, prepared to

"Seize upon truth where'er 'tis found."

The advocates of the confessional believe it to be an institution of the church of God, and its claims to this honour must be examined before we regard it in its social bearings.

The confession of sin was a duty enjoined under the Jewish dispensation. The high priest, at the feast of expiation, made confession to God in the name of all the people; and the people practised confession as a personal duty, as appears from Numbers v. 6:—
"When a man or woman shall have committed any of all the sins that men are wont to commit, and by negligence shall have transgressed the commandment of the Lord, they shall confess their sin and restore the principal, and a fifth part over and above." Again, this duty was enjoined in later times, for we find the royal Solomon declaring that—
"He that hideth his sins shall not prosper: but he that shall confess and forsake them shall obtain mercy," Prov. xxviii. 13.

So far from this law being abrogated by Christianity, we find John the Baptist, the forerunner of our Saviour, baptizing the multitudes who went out to hear him, on their receiving his word and "confessing their sins;" and many of the apostles have given it their support, both by example and precept. We find St. James saying, "Confess your sins one to another, and pray for one another, that you may be saved," and thus teaching us that the confession of our sins to man is a condition of salvation. Again, we read in 1 John i. 8, 9:—"If we say that we have no sin, we deceive ourselves, and the truth is not in us. If we confess our sins, God is faithful and just to forgive us our sins, and to cleanse us from all unrighteousness." This testimony is so strong, and clear for the necessity of confessing our sins, that our adversaries have no other way to escape the force of it, but by vainly pretending that the apostle means only the confession of our sins privately to God alone. But that this cannot be the apostle's meaning is evident for two strong

reasons; first, because *the confessing our sins* is here put in opposition to the *saying we have no sin*; these two are opposite to one another, and therefore must certainly relate to the same object. Now, who is there in his senses that would seriously dare to say to God, in private, that *he has no sin*? In this part of the sentence, then, the apostle certainly means saying, *we have no sin before men*; and, consequently, in the opposite part of it, when he says, "If we confess our sins," he necessarily means the doing so *before men also*. Besides, the apostle here declares that, if "we confess our sins, God is faithful and just to forgive us our sins." How comes the fidelity and justice of God to be engaged here? Has he anywhere engaged his promise to pardon those who confess their sins to him alone in private? David, indeed, says, "I will confess against myself my injustice to the Lord: and thou hast forgiven the wickedness of my sin," Psa. xxxii. 5; which shows that, in the old law, when a sinner "with a broken and contrite heart," that is, with *perfect repentance* of his sins, returned to God, and acknowledged his guilt with sorrow, God, of his infinite goodness, would show mercy to such a repentant sinner. But we do not read anywhere that God ever engaged his fidelity or justice to forgive the sins of any who confessed them in private to him alone; consequently, in the above text, the apostle cannot mean the confessing to God alone; but, from what we have seen above, it is manifest that God has solemnly engaged his fidelity and justice to forgive the sins of those who confess them to the pastors of his church in the sacrament of penance, when he declares to these pastors, "Whose sins ye shall forgive, they are forgiven; and whatsoever ye shall loose on earth shall be loosed in heaven." The effects of this promise cannot be obtained, as we have clearly seen, unless the sinner confess his sins to his pastor; and when he does that with the proper dispositions, then this sacred promise of Jesus Christ engages him, in fidelity and justice, to grant the wished-for pardon.

The confessional being thus surrounded by so many scriptural sanctions, we shall not be surprised that it has ever been regarded by the church as a channel appointed by God through which the grace of justification flows into the sinner's soul. I am aware that some assert that the confessional is only

an institution of the thirteenth century; but this only shows their ignorance of history, or their wilful misinterpretation of it. It is only necessary for us to cite one or two witnesses to put them to silence; and, first, we have one whose name will be received with reverence by all—the venerable Bede, who flourished in the seventh century. We hear him saying:—“As to our light sins, they may be forgiven by confessing them to our neighbour, and by their praying *for us*; but if we are stained with impurity, or infected with a leprosy of great sins, we must, according to the laws, confess these to the priest; and he must perform the expiation according to his will, during the time and in the manner which he shall command us.” Egbert, bishop of York, who flourished in the eighth century, wrote a penitential for the direction of the confessor and the confessing, and urges the duty of confession upon all true penitents. That this custom was recognised by the church at large is evident from the fact that Alfred the Great and Gurtarnus ordained, in union with the clergy, that, if any criminal wished to have a priest to confess to, this privilege should never be denied him; and, in the canons enacted under King Edgar, it is enjoined upon persons going to confess to arm themselves with fortitude to make a full discovery of their faults, “because, without confession, there is no pardon to be hoped for.”

There is another fact that ought not to be overlooked in this discussion, and one which we commend to the special attention of our opponents, viz., that the Church of England, with all her errors, recognises the duty of confession, as appears from her 113th article, which runs thus:—“Provided always, that if any man confess his secret and hidden sins to his minister for the unburdening of his conscience, and in order to receive spiritual consolation and ease of mind from him, we do not in any way bind said minister by this our constitution, but we do strictly charge and admonish him that he do not at any time make known to any person whatever any crime or offence so committed to his trust and secrecy.”—See *the body of the canons drawn up in 1663*.

Having said so much of the institution of the confessional, we have little space left in this paper to devote to the separate question, is it “in harmony with intellectual and moral

freedom or social well-being?” Nor, indeed, is this necessary, for we might at once argue, *à priori*, that no institution sanctioned by God can be opposed to the true welfare of man. None can be so well acquainted with the nature and wants of man as his Maker, and He graciously ordained ordinances to meet those wants in connexion with His holy church. The confessional may be opposed to sinful practices and vicious passions; but these, again, are opposed to man's highest interests; for they debase his mind, defile his heart, and undermine the very foundations of society. The confessional opposed to freedom? Never, when the *freedom to do as we choose* is associated with the *determination to do as we ought*. As to its bearing upon social well-being, hear the testimony of one who surely will be taken as an impartial and a true witness—I mean Voltaire. He says:—“There is no more wise institution than that of confession. The most of mankind guilty of crimes are naturally tormented with remorse. The lawgivers who established mysteries and expiations were equally anxious to prevent the criminals, under the influence of despair, from rushing recklessly into new crimes. Confession is an excellent thing—a bridle on inveterate crimes. It is excellent for disposing hearts ulcerated with hatred to forgive; and the unjust, the injuries they may have done to their neighbour. The enemies of the Roman Church, who oppose so salutary an institution, have taken away from man the greatest check that can be imagined on iniquity. The wise men of antiquity have all recognised its importance. The Catholic religion has consecrated that of which God permitted human wisdom to perceive the advantage and embrace its shadows.”

If evidence still more distinct be desired as to the effects of the confessional on the well-being of society, we have only to cite Raynal, who, in his “*Philosophical and Political History of the Indies*,” says:—“The Jesuits established in Paraguay a theocratic government with the practice of confession—the very basis on which religion reposes. It alone is a substitute for all penal laws—preserves and watches over purity of morals. In Paraguay religion, more powerful than the force of arms, conducted the criminal to the knee of the magistrate, whereas far from palliating his crimes, repentance made him aggravate them; where, far from

cluding punishment, a humble suppliant, he demanded it on his knees. The more severe it was, the more it tranquillized the conscience of the criminal. This chastisement, which everywhere else terrifies the criminal, here consoles him in banishing remorse by expiation. The people of Paraguay have had no criminal laws, because each person voluntarily accused and punished himself. All their laws were precepts of religion. The ties of all governments would be that of a

theocracy in which the tribunal of confession would be established."

We commend these words to the attention of the thoughtful readers of the *British Controversialist*, and the whole question to their impartial consideration, believing that they will be convinced that the institution under review is in harmony with man's highest interests, and productive of his true welfare.

CONFESSARIUS.

The Societies' Section.

EUROPEAN PHILOSOPHY.

BY THE AUTHOR OF "THE ART OF REASONING."

PROLOGOMENA—(Continued.)

BEING, knowing, doing! Mystery-enshrouded conceptions! how fondly have men aimed at comprehending "the full significance" of all that is wrapt up in these little words! how ardently have they gazed at *life*, *intellect*, and *action*!—these three wondrous correlates existent in humanity—that they might acquire a knowledge of their various interdependencies! how eagerly have they toiled on, with unintermittent energy, in the anxious endeavour to penetrate into the regions of absolute Truth! And must all these impulses which move us to attempt the decipherment of "the purpose of life," which tempt us to forsake "the torpid quietude" of ignorance, which urge us to the performance of the task-work of great thoughts and deeds, which incite us still to work on and pause not, in the hope of winning yet the goal at which we aim, be adjudged inutile and vain? Can all the toil of thought the sages of the earth have undergone be fruitless? Must all the hopes which they have entertained be classed with dreams and phantasms? Dare we assert that—

"All this fair Nature is but as a mask,
And this her wondrous beauty * * *
Is but the beauty of the Sphinx, that smiles
Its dread enigma in the face of men"?

Necessity laid upon us to sigh out, with "Manfred"—

"Sorrow is knowledge: they who know the most
Must mourn the deepest o'er the fatal truth,
The tree of knowledge is not that of life.
Philosophy and science, and the springs
Of wonder, and the wisdom of the world,
I have essayed, and in my mind there is
A power to make these subject to itself—
But they avail not!"

Can we believe that all is sterility and barrenness, and yet that Deity has given to our intellect an impetus which "goads it on again to run its fruitless circle"? Is the destiny

of man an "interminable theme, which still eludes all seizure"? Is it true that "to aspire to the knowledge of mental phenomena, their resemblances and successions, is to aspire to transcend the limitations of human faculties"?* Are we—if this be true—merely *phenomena* to ourselves? Is *self-knowledge* an impossibility? Is *consciousness* not a possession, but an appearance? Is *personality* a figment? and *self-differentiation* a mere product of Transcendentalism? Can we abnegate the notion of self, or are we necessitated to postulate *that* as one of the prime, elemental *facts* in nature, without which all other facts or notions would be impossible? Have we *here τὸν σῶν*, a stand-point of certainty—an indubitable actuality? If so, then is Philosophy possible. If so, man is not

"Like a loose wheel in some crushed mechanism,
Whose sick and feeble motion spends itself
On its own inane circle,"

but is interlinked by numerous relations; such as origin, succession, co-existence, final cause, &c., with other beings, while many time-ties unite him with the past, the present, and the future, as well as co-active in the production of those causes whose effects shall constitute futurity. If, then, we can *reason* from what we *know*, Philosophy is possible, and the mysteries which enshroud that being of "mixed essence," who on earth is found

"Contending with low wants and lofty will,"

are resolvable, and shall yet become as patent to the thought-energies of humanity, as are *now* the properties, &c., of—

"The lightning pale, that scrawls with hurried hand,
Huge hieroglyphics on the screen of night."

It cannot be denied that we are so constituted as to desire a correct acquaintance with the Philosophy of our own nature—a knowledge of the laws of being, knowing, and doing. On the accuracy of our information on these points our welfare, in a great measure, depends. All human soul-queries may be reduced to a fourfold classification; viz.:—1st. Ontologic—What *am* I? 2nd. Critic—What can I *know*? 3rd. Dikaistic—What ought I to *do*? 4th. Elpistic—What may I *hope*? Without an answer to these interrogations, the soul cannot rest satisfied, and Philosophy, like the ark-dove, is continually on the wing, seeking a resting-place for "the sole of her foot." But she will not always be "seeking rest and finding none." Surely she is yet destined to return with "an olive-leaf pluckt," indicative of peace, to "the city of Mansoul," as quaint old Bunyan hath it! Such hopes, at least, by the constitution of our nature burn within us, nor were we wise to wish for their extinguishment. "For what end and from what source were these extra-mundane endowments and wishes placed within us, that we should wish to stifle them in their birth-world? Let us rather set ourselves energetically to discover a solution. By collecting and classifying the phenomena of human thought—by discovering the limits of the intellectual faculties, and confining our researches within these—by carefully examining the motive-sources of human action—by closely and rigorously analyzing the moral judgments which we form—by judiciously reading the hopes which rise spontaneously in the soul, and estimating the probabilities of their ultimate fulfilment, may we not hope

* Lewes's Biographical History of Philosophy, vol. i. p. 21.

perform this? "Truth is the daughter of Time," say the ancient sages; and they are right. Instead, therefore, of concluding, with one of the ablest expositors of philosophic tenets, that "it is in vain to argue that the difficulty of Philosophy is much greater than that of any other science, and therefore greater time is needed for its perfection. The difficulty is impossibility. No progress is made because no certainty is possible."* Let us rather, welcoming the difficulty—"proud to be daring"—prove that

"The high-born soul
Disdains to rest her heaven-aspiring wing
Beneath its native quarry."

If there be truth in human aspirations, hopes, or feelings—if our own souls do not betray us—if the voice of nature lies not, Philosophy is possible. And even were it not so, who would not rather dare the Impossible, fighting bravely, and dying "with harness on his back," than walk "the green unripened universe," partaking of "the old insanities of life," wearied and forlorn, the living sepulchres of crushed and ruined hopes, bearing about with us, throughout "the ceaseless, changeless, hopeless round of weariness and heartlessness," a soul in which Death sits gnawing at the core, as

"Mindless of our immortal powers and their
Immortal end, as is the pearl of its worth;
The rose its scent; the wave its purity?"

Let us not be misunderstood, however; as if we sought to elevate Philosophy to "the enthroned seat" of Religion. There is this difference between the offices fulfilled by these twin-sisters. Religion is the all-credence-worthy *practical* instructress of humanity; divinely commissioned, she descends from heaven with a dogmatic code of regulations applicable to *life and conduct*. But to whom are these instructions valuable? By whom will this code be accepted? Whose credence will be given to her august authority? Will it be the man whom no soul-queries have disturbed?—in whose mind no lofty aspirations burn?—in whom no *want* has been developed?—who demands no solution of his destiny? No! It is when the soul is awakened to its needs—when the incompetency of mere earthly life to satisfy his hopes has been felt—when the past is insufficient, the present horror and the future agony—when the soul is excited and despairing—when thought, reflection, speculation, philosophy, have taught the mind the *need* of a life-guide that religion becomes acceptable. Religion gives peace to the mind through the necessity which the mind feels for some guidance, for some balm to its distress, for some light in the profound darkness. Religion gives life and vigour to the soul by calling forth faith; and, so long as life-sustenance can be drawn from authority and testimony, the life of faith in the soul is active. But reason requires to be satisfied of the validity of the grounds on which faith rests, demands that the credentials of religion be given to its inspection; asserts its right to "prove all things." Philosophy, then, is the *ordinator* of the speculations of the intellect; the arbiter of the true and the false; the assayer of opinions; the critic of faith and practice. Religion appeals to Philosophy to prove that she is required; that she is adapted to satisfy man's wants; that her credentials are duly authenticated; that she can bring true peace to the soul. Not only so; but Religion takes for granted the labours of

* Lewes's Biographical History of Philosophy, vol. i. p. 21.

Philosophy assumes the existence of truth, the idea of destiny, the possession of moral principles, &c.; gives her answers to his most urgent soul-queries, and leaves their elaboration, classification, proof, and illustration, to Philosophy. Philosophy is necessary, that a man may *know*; Religion, that he may *do* and *hope*.

Having thus far elaborated the arguments—1st. For the existence of philosophic thought; 2nd. The possibility of Philosophy; 3rd. The differentiation of Philosophy from Religion, and the fact of their co-existence—we shall, in our next, briefly place before you a synoptical view of the pathways of thought through which we desire you, with us, to wend. This will be advantageous, not only as a guide in the future, but as an incitement in the present. It will prepare the mind for understanding the divergences in our course, as well as for a perception of the goal at which we aim. The way is arduous, the toil severe; but such as are willing to gird up their loins, and follow our guidance, we feel persuaded shall not return, crying, "All is barren!" but will be ready to assent to the opinion of the amiable Jouffroy, that "the history of Philosophy is an important study, a study which eminently belongs to the present epoch; and it is no less curious than indispensable to regard it, not as a catalogue of strange opinions, altogether foreign to the affairs of this world, produced at hazard in the head of certain individuals, at such and such a time, in such or such a country, but as a progressive series of attempts to solve the questions which most nearly concern humanity, by everything most illustrious to which it has given birth."

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Nottingham Castle Gate Young Men's Mutual Improvement Society.—The third annual meeting of the above valuable society was held in the Hounds Gate schoolroom, on Tuesday, June 1st. At five o'clock about fifty persons of both sexes partook of tea provided by the committee; after which the Rev. R. S. M'All took the chair, and delivered a most impressive and instructive address, urging the young onwards in the work of self-improvement. Mr. H. Bray, the secretary, read the report; from which we learn that the society is in a progressing state. During the past year its members (twenty-five) have read upwards of thirty essays upon religious, historical, and scientific subjects. Several discussions have taken place upon "The Union of Church and State;" the "Temperance" question; "The Character of Oliver Cromwell," &c. &c. The adoption of the report was moved by Mr. William Crosbie, seconded by Mr. Bonser, and supported by Mr. S. W. M'All (son of the chairman), who spoke at length upon the principles and workings of such societies. The meeting was also addressed by Messrs. Hackett, Smart, More, Preston, and W. Filkin, Esq., Mayor. The evening's entertainment was varied, at intervals, by the handing round of plates of fruit, &c., and the meeting

broke up about ten o'clock, with best wishes for the society's progress and prosperity. The officers of the society are as follows:—Mr. S. W. M'All, president; Mr. F. Booth, vice-president; Mr. H. Bray, secretary; Mr. S. Page, treasurer; committee, Messrs. S. Briggs, R. Breese, W. C. Underwood, S. Sanders.

Leovil Mutual Improvement Society.—On the evening of Tuesday, June 1st, the members of this society held a public soiree at the town-hall. In the absence of the president, G. Harbin, Esq., the chair was efficiently occupied by T. Lyon, Esq., one of the vice-presidents. A report of the proceedings of the society, and of its gratifying success since its formation, was read by Mr. Williams, one of the honorary secretaries, after which J. T. Vining, Esq., the delegate from the institution to the Society of Arts in London, gave some interesting information respecting the conference, and alluded to the benefits likely to result from it. Addresses were also delivered by Messrs. Bide, Newman, Tucker, Highmore, Hanham, &c. The amateur music-class contributed much to the enjoyment of the evening, and the meeting was prolonged to a late hour, and gave general satisfaction to its numerous and respectable attendants.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

112. What is the meaning of the letters Jm and re, occurring in old charters and deeds, and inserted in place of the year?
113. Will some of your readers favour me with the plan of a diary, and inform me whether it is usual to enter each day's proceedings?
114. Having lately witnessed, at a microscopic exhibition, the decomposition of water, I am anxious to know what zinc is used, and how it is applied. Should any danger arise from the gaseous separable state, please to point it out. G. H. F.
115. Having devoted my attention for some time to that most interesting branch of natural science, botany, and feeling the desirability of preserving specimens of plants, I shall feel much obliged to any of your readers who will give me some instructions as to the best method of forming a herbarium.—R. F.
116. Could any reader inform me of the nature of "laughing gas"—of what it is composed, and its use, and if it is injurious in its effects? A. C.
117. The writer, being in the habit of forwarding notices to local newspapers, is desirous of receiving advice, which, if practised, would be likely to obviate the following defects in his style, composition, &c.:—His sentences are generally too long, sometimes convey several distinct ideas, mingling on each other, but not necessarily connected. There is a stiffness in his composition which he is anxious to supersede by a flowing and graceful style. There are, also, occasional defects in his punctuation, arising from the want of a simple, fixed rule, which some friend will, perhaps, kindly furnish.—E. W. L.
118. Can any readers of "The Inquirer" inform W. H. W. whether there would be ready employment for a Cambridge student in any of the larger towns of Australia, as a teacher or assistant in a school? The extent of his acquirements is a moderate acquaintance with Greek and Latin authors, and the elementary mathematics. Also, whether a slight acquaintance with French and German would be any additional advantage, and by what means such employment could be best obtained? Would such a person find any difficulty in procuring a situation as a school teacher in Germany or France, and what salary would he be likely to obtain in those countries respectively?
119. I should be much obliged if you or some of your correspondents would inform me whether a chicken is hatched from the yolk or the white of an egg.—P. C. C.

ANSWERS TO QUESTIONS.

114. *Common-place Books.*—Without for one moment considering myself to answer to the Festus-like portrait that "A Student" has drawn, I am still disposed to believe that the subjoined notes may possibly be of some service to him. Inferring from the *modus operandi* of the common-place books in general circulation, it is conjectural

that their utility in a great measure depends on the persons that use them. These books are, as all know, intimately associated with the name of Locke. From this fact a suggestive inference may be drawn. For myself, I cannot profess to advance an opinion, not having used one myself, or even seen one in use. Perhaps this is not quite correct, for the "Index Rerum" is, in its purposes, nearly allied to the *common-place books* most in vogue. Of the "Index Rerum" (the using which I am about to explain and sincerely advocate) I can speak positively and from personal experience, having myself used one for some time; and I can assure "A Student" that, when intelligently kept, it fully answers all the questions he has put with reference to such books. As to making out an "abstract or analysis" of a work, or taking notes, though each of these modes has been profitably pursued by several eminent men, I think that the "Index Rerum" unites all the advantages of both notes and analysis, together with many more; and that, too, by the expenditure of far less time and trouble; not that the "Index" forms a "royal road" to a vast store of available knowledge; no; to make a really good and useful one—one that shall be available *at all times*, and without an expensive trouble—much thought and labour must be expended. But the advantages, direct and indirect, accruing amply repay all the pains and time expended. But I must proceed to unfold the method of using it. This I will do as clearly and with as much brevity as possible. The book to contain the *index* should be of the *quarto* size, and number at least 120 pages. A few quires of paper stitched in a cover would, of course, answer the purpose; but, as one book must last the owner "his whole life," it is advisable to have two or three times as many pages, and have them strongly bound. "Index Rerum," blank as regards *contents*, are sold at 8s. 6d. each. These have the initial letters and vowels printed, and the pages ruled in blue, and are altogether of a superior description. I must suppose the student has one entirely blank, and is now about to make use of it for the first time. Opening it at the first page, he would draw an ink line parallel to, and about an inch from, the top edge, and another line perpendicular to the former, and about two inches and a half from the left-hand side of the book, and so on through every page. Turning again to the first page, he must place the first letter of the alphabet, in *capital*, in the immediate left-hand corner, and the first of the series of vowels in the centre of the first line, but in *small* or *italic* character, and so proceed to the end of the book, arranging each of the five vowels as integers to each of the capitals till the alphabet has been exhausted, thus obviously requiring 120 pages. If more pages are used, every vowel must be repeated accordingly. Then, further, supposing that "A Student" has been reading of Anabaptists (as this word is adapted for the first page), he would place it, as being a term involving the *chief idea*, in the left-hand margin of the first page, the numeral vowel, "a," being coincident with the first vowel of the word—i. e., the first that follows the initial

letter. Then would follow a brief but comprehensive definition or index of the subject connected with the indices, Anabaptist, and also a reference to the book and page containing the subject in question. This "posting" may be thus shown for example:—

A.	a
Anabaptists	account of the creed of. Smith's "Hist. of the Sects," vol. i. p. 100.

There are then three things to be considered; first, the term that shall involve the principal idea: this is sometimes somewhat difficult to the novice, as the word that will be certain to eliminate the same train of ideas in the future as it does at present must be sought and employed; second, the definition, which should evidently be as concise and cogent as possible; third, the reference. When these are properly arranged, there can be no difficulty in making an immediate reference to any subject of which you have at any time read and noted. This is, undoubtedly, the chief advantage. But there are very many collateral and scarcely less valuable advantages, and these possess the unusual rarity of being absolutely indispensable. There are these:—Attention is arrested and concentrated; hence memory is brought into useful action, and thereby strengthened; it is also aided by the adventitious circumstances of posting, &c.;—a tendency to digest and dwell on the information educed by reading is originated and assiduously fostered. Many others might be mentioned: but these will certainly form a sufficient "deposit" to induce "A Student" to commence the undertaking, and to pursue it hopefully. In connexion with the "Index Rerum" used by myself I have introduced "A Vocabulary of Synonymes and Unusual Words," the latter of which, however, I think of discontinuing; for, having lengthy, high-sounding terms at command, a tendency to make undue, and even ridiculous, use of them is cultured. I speak from a sense of the great error into which I have myself fallen. On others, perhaps, this hint may have salutary influence. Words and phrases suitable for a Johnson may not grace the thoughts or style of a student. Let me observe that it is advisable, on the ground of neatness and facility of reference, to have "paper and pencil in hand" when reading, and thus take the index, posting on the following day. In this way the intervening time allows opportunity of altering the indices and modifying the definition, if then it is deemed advisable. The "Index Rerum" was invented by Dr. Todd, and a full description of it is found in his "Student's Manual," a book of several hundred pages, very useful, and sold at a low price—1s. 6d., I believe. Any other information on this topic I should be most happy to communicate to "A Student" by post, if he should require it, and will furnish me with his address. A further explanation of the use of the integral vowels will, perhaps, be needed. They are used to "divide and conquer," and to aid all kinds of reference. The limited width of the columns of "The Inquirer" will not admit of the examples "A Student" requests; indeed, in this matter it is obvious that a reference which would be at all times recognisable by him who wrote it would not, therefore, be apprehended by any other

person. Difference of mental constitution solves this paradox. An "Index Rerum" is essentially peculiar to him who constructs it.—SENOR.

107. *The French Language.*—Having studied French, I may be, perhaps, excused for venturing to reply to the queries of D. J., and for giving the routine which I adopted. It may be well to state that the French language is now in use throughout the world; and, with the single exception of the English, it is the most polite, as well as the most *recherché*, language spoken. There is but little difficulty in acquiring the grammatical construction: the pronunciation is, however, the most important branch of the study; and your correspondent, if he wishes to distinguish himself in company by taking part in the conversation, should not only seek the assistance of a French master, but endeavour to pass some three or six months in France. The latter is, undoubtedly, the preferable plan; and he will in that short space of time acquire a much more correct knowledge, not only of the construction, but likewise of the pronunciation (which is of paramount importance), than by passing any period, however lengthened, in these realms. In France he will, of necessity, hear nothing spoken save the language of that country; and the difficulty of conversing with any person, or of making any inquiries, save in the French language, will compel him to become as familiar with it as he possibly can. He will soon overcome difficulties, and after a few days will be competent to make any of the inquiries in French which are most connected with his business there. Questions relative to the country—diet—mode of living—travelling; indeed, all queries having any reference to his physical wants, will soon become quite familiar to his tongue as well as to his ear. What Englishman is there who, although never having been in Paris, can understand the every-day phrases of—*Parlez-vous Français, monsieur? Comment vous portez-vous? Avez-vous diné? A quelle heure vous couchez-vous? J'ai faim. J'ai soif. Voulez-vous promener avec moi? Madame, votre santé.** And a hundred other questions now almost as familiar to us as English. A knowledge of this language is indispensable to any one who wishes to become acquainted with literature, history, political economy, &c., as some of the best standard works are written by the French. Such works are always sought by those who are desirous of becoming well read. I will briefly state the system which I pursued when aspiring to an acquaintance with the language. I obtained the French Grammar by M. Levison, and wrote out carefully into French the exercises as they appeared in the book. I had two lessons of one hour each per week, and I came each time prepared with a certain amount of exercises, which my tutor corrected. I also learned by heart about forty words per lesson. In addition I had a "conversation-book," in which questions on various topics, but mostly in accordance with common usage, were given in French—the answer (in English) was placed opposite. In like manner I learned these. At each lesson I had a verb

* Do you speak French, sir? How do you do? Have you dined? At what time do you go to bed? I am hungry. I am thirsty. Will you take a walk with me? &c.

conjugate, to prepare for recitation at the following lesson. Of course each verb was conjugated according to its termination, an example of which was given in "The British Key to the French Verb," by H. Levalleux, my tutor. This is one of the simplest and best works on the French language; indeed, my progress with its help was very rapid. Lastly, I read frequently (with my tutor) in French, and translated likewise into English. "Easy Lessons in French," reprinted from "The Working Man's Friend," price 6d., may be consulted by your correspondent. I have not examined them, consequently I cannot speak to their utility, or to the character of the method of instruction which they pursue; yet, if the testimony of their publisher is correct, they bid fair to be a very useful and cheap method of acquiring "La Langue Francaise." Lessons in French are also published weekly in the "London Journal." I would not, however, recommend your correspondent to seek instruction through the medium of that journal, as the character of some of the papers published therein is more calculated to cumber the mind of D. J. with vague, unreal, and visionary speculations of novel and romance than to benefit it by the study of French. The price of the works which I studied (exclusive of tuition) amounted to about 17s. No other books are required for the acquisition of the language, although a constant perusal of, and acquaintance with, French

newspaper literature is indispensable—that is, if your correspondent is desirous of preserving his knowledge of the language.—J. G. R.

108. *The German Language*.—I cannot give your correspondent "Arnaud" any information as to the methods of Ollendorf, Robertson, and Lebahn, for teaching a language, never having seen their works; but perhaps it may be of use to him to know that the German language may be learnt easily and well, without the aid of a tutor, from the following books:—1. F. Ahn's "New Practical and Easy Method of Learning the German Language," in two parts, published by Brockhaus and Avenarius, Leipzig.—2. Schmidt's "Synoptical German Grammar;" Simpkin, Marshall, and Co.—3. Stahl's "Manuel de Phrases Francaises et Allemandes;" Paris, J. H. Truchy.—4. "Dictionnaire Complet Francais-Allemand-Anglais," fourth edition; Leipzig, Brockhaus. After the first three have been gone through carefully, and the exercises written out, he will be able to follow without much difficulty the lessons, gospels, epistles, &c., as they are read in church (if he attends one) in a German bible—a plan which will accustom him to the different styles of composition—historical, poetical, devotional, and argumentative, which are all to be found there. This plan has helped me much in studying the Greek, Latin, French, and German languages.—F.L.

The Young Student and Writer's Assistant.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XVIII.

1. How can Logic be defended from the objection, that it is incapable of offering formal rules for the detection of Semi-Logical and Non-Logical Fallacies?

2. What are Semi-Logical Fallacies, and into how many classes may they be arranged?

3. Describe the characteristics of each class, and give examples.

4. What are Non-Logical Fallacies, and into how many classes may they be arranged?

5. Describe the characteristics of each class, and give examples.

6. Detect the Fallacies in the following quotations:—

1. "Many thousands in your metropolis (says Sir Thomas More) rise every morning without knowing how they are to subsist during the day; as many of them, where they are to lay their heads at night. All men, even the vicious themselves, know that wickedness leads to misery; but many, even among the good and the wise, have yet to learn that misery is almost as often the cause of wickedness.

"There are many (says Montesinos) who know this, but believe that it is not in the power of human institutions to prevent this misery. They see the effect, but regard the causes as inseparable from the condition of human nature.

"As surely as God is good (replies Sir Thomas) so surely there is no such thing as a necessary evil; for, by the religious mind, sickness, and pain, and death, are not to be accounted evils."

Southey's "Colloquies on Society."

2. "A people may be too rich, because it is the tendency of the commercial, and more especially of the manufacturing system, to collect wealth rather than to diffuse it. Where wealth is necessarily employed in any of the speculations of trade, its increase is in proportion to its amount. Great capitalists become like pikes in a fish-pond, who devour the weaker fish; and it is but too certain that the poverty of one part of the people seems to increase in the same ratio as the riches of another. There are examples of this in history. In Portugal, when the high tide of wealth flowed in from the conquests in Africa and the East, the effect of that great influx was not more visible in the augmented splendour of the court and the luxury of the higher ranks than in the distress of the people."—*Ibid.*

3. "He that imposes an oath makes it,
Not he that for convenience takes it;
Then how can any one be said
To break an oath he never made?"

"Hudibras," book ii. chap. 2.

4. "Embowelled! if thou embowel me to-day,
I'll give you leave to powder me, and eat me too,
to-morrow! 'Sblood! 'twas time to counterfeit, or
that hot termagant Scot had paid me scot and lot
too. Counterfeit? I lie, I am no counterfeit.
To die is to be a counterfeit; for he is but the
counterfeit of a man, who hath not the life of a
man: but to counterfeit dying, when a man thereby
liveth, is to be no counterfeit, but the true and
perfect image of life indeed."

Henry IV. Part I. act 5, scene 4.

GRAMMAR CLASS.

Exercises in Grammar.—No. VII.

1. Construct a form like the one given, and arrange the subjoined phrases in their proper columns:—

The pilgrim's progress. The Christian's hope. Bunyan's "Pilgrim's Progress." The works of Newton. The servant of the king of Israel. Alliene's "Christian's Armoury." The pride of glory. The mandates of the ministry of Britain. The rights of the people of England. The laws of Moses. Burns' "Cotter's Saturday Night." The world's glory. Evening's silent breath. Duncan's Cicero's "Orations." Spirits of the mighty dead. The duties of the followers of Jesus Christ. The wealth of the merchants of Glasgow. The conqueror of Darius. Haynes' Virgil's "Æneid." A warrior's sword. Night's starry robe. Jacob's children's children. The words of the preacher. The progress of the pupils of this institution. The sceptre of the Queen of England. The son of David. Gibson's "Thompson's Seasons." Stewart's "Gray's Arithmetic." Beautie's "Virgin Tear." The sun's bright circle. Wilkie's "Blind Man's Buff." The wreck of Thebes. The speech of the hero of a hundred fights. The history of the philosophy of Europe. The law of our being. Dilworth's "Schoolmaster's Assistant." Ocean's dark expanse. The "Arabian Nights' Entertainment." Ainsworth's

"Miser's Daughter." Lovell's "Wife's Secret." The caprice of fortune. The last of the Roman kings. The apostle of the Gentiles. The rust of sloth. The educational scheme of the Church of Scotland. The currents of the straits of Gibraltar. The spirit of the religion of Christ. The frowns of fate. Chambers' "Burns' Poems." Scotland's hero. Homer's "Iliad." The love of God. The style of Cicero. Murray's edition of "The Works of Lord Byron." The brilliancy of Macaulay's writings. Cruikshank's "Bottle." Tallis's "Hume's History of England." The child of affliction. The humour of the works of our early writers of comedy. The horrors of the stormy deep. The pencil's mimic skill. Green's "Barnes' Notes." The dust of the earth. The breath of the morn. The stroke of the hammer. The reviews of Gillfillan's "Bards of the Bible." A view of the works of God. The wreck of the wooden walls of Old England. The close of a day of pleasure. Macnee's portrait of Dr. Heugh, of Glasgow.

2. Put the following prepositional possessive phrases into a terminational form:—
The children of Israel. The peace of God. The Queen of England. The homes of the million. For the sake of peace. The character of Felix. The seminary of the lady. The school of the ladies. The voice of the nation. The decision of the nations of the world. The sons of victory. The voice of conscience. The petition of the mouse. The training of the children. The rights of man.

SOLUTIONS.—VI.

Arithmetic and Algebra.

Question 21. Let $3x$ = the money he had (in shillings),
then x = the sum he first gave away,
and $2x$ = the money left.
 $\frac{3}{4} + 2x = \frac{3x}{2}$ = what he gave the tradesman.

By question $2x - \frac{3x}{2} + \frac{9}{2} = 15$
or $4x - 3x + 9 = 30$
 $x = 21 \therefore 3x = 63s.$ —Ans.

R. M.

Question 21 (second solution). Before receiving the change he had 15s.—4s. 6d. = 10s. 6d.
This was the remaining $\frac{1}{2}$ after his payment of $\frac{1}{2}$.
Therefore, before that he had 10s. 6d. $\times 4 = 42s.$
But this last sum was the remaining $\frac{1}{2}$ after paying $\frac{1}{2}$.
Therefore, $\frac{1}{2} : 1 :: 42 : 63s.$ the original sum.

W. H. R.

Question 22. Let $2x$ = the number of eggs;
then, as $8 : x :: 6 : \frac{6x}{8}$ or $\frac{3x}{4}$ = cost of one half the eggs;
and, as $10 : x :: 6 : \frac{6x}{10}$ or $\frac{3x}{5}$ = cost of the other half the eggs;
also, as $9 : 2x :: 6 : \frac{12x}{9}$ or $\frac{4x}{3}$ = what he sold the eggs for.

$\therefore \frac{3x}{4} + \frac{3x}{5} = \frac{4x}{3} + 15$, clearing the fractions.
 $45x + 36x = 80x + 900$
 $81x - 80x = 900$ or $x = 900$
 $\therefore 2x = 1800$ —the number of eggs, required.

G. C. H.

Proof.—As $8 : 900 :: 6 : 675$ = cost of half the eggs;
-and, as $10 : 900 :: 6 : 540$ = cost of the other half the eggs;
 1215 = cost of all the eggs;
and, as $9 : 1800 :: 6 : 1200$ = what he made of the eggs;
 $\therefore 15 = 10s.$

G. C. H.

Question 23. $x + y = 18$ (1) } find x and y .
 $x^2 + y^2 = 1674$ (2) }
 Cubing (1) and subtracting (2) we have
 $3x^2y + 3xy^2 = 4158$
 dividing by 3 and taking out the common factor,
 $\therefore xy(x+y) = 1386$
 substituting in (1)
 $\therefore 18xy = 1386$
 $\therefore xy = 77$
 $\frac{18}{18} = 77$
 Again: $x + y = 18$ (3)
 $xy = 77$ (4)
 squaring (3) as the first method for finding the
 value of $x-y$
 $x^2 + 2xy + y^2 = 324$
 subtracting four times (4) we have
 $x^2 - 2xy + y^2 = 16$
 $\therefore x - y = 4$ (5)
 $\therefore x = 11$ or 7 } Lastly, $x - y = 4$ (5)
 $\therefore y = 7$ or 11 } $x + y = 18$ (1)
 which values }
 verify the } by addition $2x = 22$
 original equa- } $\therefore x = 11$ or 7
 tion (1) & (2). }
 by subtraction $2y = 14$ or -22
 $\therefore y = 7$ or -11 .

Geometry.

Question 11. The surface of a sphere is equal
 to that of its circumscribed cylinder; *ergo*, the
 number of square miles on the surface of the
 earth = $7926^2 \times 3.1416 = 62621476 \times 3.1416 =$
 197359949.0016 ;
 and the extent of surface occupied by water
 $= 24 + 734 : 734 :: 197359949.0016 : 141862202.5071744$ square miles,
 and the extent of surface occupied by land
 $= 24 + 734 : 246 :: 197359949.0016 : 52497746.4344256$ square miles. J. J.

Mechanics.

Question 10. The work due to friction, sub-
 tracted from the work due to gravity, will give the
 work of the train; thus:—

$$100 \times 2240 \times 9 - 100 \times 8 \times 600 = 1536000$$

$$\therefore V^2 \times 100 \times 2240 = 1536000$$

$$\frac{64}{V^2} \times 100 \times 2240 = 98816000$$

$$224000V^2 = 98816000$$

$$V^2 = 441$$

$$\therefore \text{Velocity} = 21 \text{ feet.}$$

Question 11. It will be easier if we suppose
 that the train has to ascend a hill of 20 miles, and
 having a rise of 9 feet in every 600 feet, because
 the horse power of the engine must be the same,

whether conveying the train 20 miles or only 600
 feet, the same work being performed on every
 600 feet of the whole distance.

$$\text{Speed of the train in ft. pr. min.} = \frac{20 \times 5280}{(60)} = 1760$$

$$\text{Weight of the train in lb.} = 2240 \times 100 = 224000$$

$$\text{Rise of rail in 1760 ft.} = \frac{1760}{600} \times 9 = 26.4 \text{ ft.}$$

Hence it appears that the whole weight of the
 train is raised 26.4 ft. every minute in opposition
 to gravity.

$$\text{Work due to gravity per minute,} \\ = 224000 \times 26.4 = 5913600;$$

$$\text{work due to friction per minute,} \\ = 100 \times 8 \times 1760 = 1408000;$$

$$\text{and total work} = 7321600$$

$$\therefore \text{horse power} = \frac{7321600}{33000} = 221.87 \text{ nearly.}$$

J. B. H.

QUESTIONS FOR SOLUTION.—VIII.*Arithmetic and Algebra.*

28. A man and his son together can do a piece
 of work in a days, which the man could do in b
 days. How long will the son be doing a similar
 piece of work by himself?

29. A ladder 40 feet long will reach the top of
 a wall over a ditch 15 feet wide. The height of
 the wall is required.

30. An irregular piece of land, containing 67 a.
 2 r. 16 p., is to be exchanged for a square piece
 of the same area. Required the side of the
 square.

31. Given, $x^2 + xy = 126$, and $xy - 2y^2 + 5 = 0$,
 to find x and y .

Geometry.

14. Required the side of the largest equilateral
 triangular pyramid which can be made out of a
 sphere of iron whose diameter is 18 inches, sup-
 posing there be no loss by the change of form.

15. Required the content of an hemispherical
 bowl, the diameter of which is 2 feet.

Mechanics.

13. A well is 100 feet deep, 17 feet in diameter,
 and 56 feet from the top to the surface of the
 water. It is required to find the time that it would
 occupy a man with a windlass to empty it, sup-
 posing that he will do 2500 units of work per
 minute, and that no water flow in during the
 process.

14. How far would the train in Ex. 10 ascend
 a second incline of 1 in 100 without stopping,
 friction being as before?

Notices of Books.

The Life of Edward Baines, late M.P. for Leeds.
 By his Son, Edward Baines, Author of the
 "History of the Cotton Manufacture." Long-
 man and Co.

[Second Notice.]

The apprenticeship of Edward Baines, the sub-
 ject of this memoir, expired in September, 1797,

and on the day following he commenced business
 on his own account. Now was the foundation-
 stone laid of his subsequent eminence. Energy,
 industry, and prudence, were his watchwords,
 and his course was one of continued progress.
 In due time he was united in marriage with an
 excellent woman, with whom, for fifty years, he
 was privileged to journey through life. Soon

came those interesting stimulants to the energies of a virtuous man—children, and he did not lack the heart and mind to answer to the increased demands. At five o'clock in the morning, and, when occasion required, still earlier, was the young printer in his office. He was above no kind of work, but might have been seen both at case and press. He kept his own books with neatness and correctness, although he had had no training in book-keeping. Not a penny went out or came in but had its record, either in his office or his domestic account-book, and hence he always knew the exact position of his affairs, a most important matter for a young tradesman. His customers and friends steadily increased, because he was to be depended upon in all that he undertook. His punctuality and method were exemplary, for he threw his soul into his work. His perseverance in business was seconded by economy at home. He began by laying down the serious resolution that he would not spend more than half his income, and to the carrying out of this he owed his future ease, not to say opulence. His habits were favourable to frugality. He always drank water, never smoked, took no snuff, and never entered tavern or theatre. While he loved good society, it has been well said that "the chief room in his terrestrial paradise was his own parlour, and of all human beings his chief companion, and best earthly friend, was Mrs. Baines." Men in Leeds were accustomed to point to him exactly as men pointed to Franklin. Old men referred the young to him as to a pattern, and it would be said, "Thou seest an example in thy neighbour Edward." At length, the *Leeds Mercury*, one of the oldest provincial newspapers, came into his hands. He purchased it with a circulation of some 700 or 800, and left it with more than as many thousands. The number of words in a copy of the *Leeds Mercury* in 1801, was 23,376, and in 1848, including the weekly supplement, it contained not fewer than 180,000. Here indeed was progress as to quantity, and we believe that it was as great with respect to quality.

Mr. Baines had now become a public man, and took an active part in the various political movements and electoral struggles of the day, but into these it is not our province to follow him. In the meantime his sons were growing up around him, full of hope and promise, for though so much engaged in business, he secured time to interest himself in their various pursuits, and to stimulate the development of their mental powers. The following is an interesting parlour scene:—

"About this time, in the intervals of the university terms, a little debating society was held weekly in Mr. Baines's parlour, of which his two sons, and their intimate friend, James Parsons, then training up for the legal profession, were the only members; whilst Mr. Baines presided over it, and judiciously summed up at the close, awarding his encouragement and advice to the juvenile orators. His eldest son and James Parsons were of the same age, and they had many years been class-fellows at the same school. Their taste for literature, law, and politics, was kindred, and the immortal speeches of Burke, Fox, Erskine, and Grattan, fed their minds, and fired their spirits. When those debates began James Parsons was not fluent, still less florid; sterling sense, correspond-

ing with his sterling honesty, chiefly marked his speeches, yet with a decided love and appreciation of high eloquence. Mr. Baines listened to the efforts of the young disputants with warm sympathy and admiration. But before this early arena was exchanged for that of active life, James Parsons, having in the interval spent some time in London, burst forth in a brilliant intellectual development: he had acquired self-reliance, had given wing to his imagination, and had discovered his capability of daring flights. His companions were now astonished at his fervid eloquence; and the kind moderator of the little society predicted future distinction. A spiritual change sanctified his talents. He devoted himself to the ministry, and has become one of the most distinguished preachers of his age. And when, thirty years later, he preached the funeral sermon of his early friend, he made touching allusion to the well-remembered scenes of youth, and, with an overflowing heart, assured the mourning family, that he 'mourned with them as with the reverence of a son, and with the affection of a brother.'

Mr. Baines had now reached the meridian of life, and had attained a position of great honour and influence. His well-known character, and his business tact, aided by his pen and press, gave him great power for the furtherance of any public movement; and that he generally employed this power for good, his promotion of mechanics' institutions, savings banks, infant schools, &c., evidences. Mr. Baines's course had been continually an upward one, but at length the time arrived for the most signal honour to be placed upon him, in his being chosen by his fellow-townsmen to represent them in parliament. The passing of the reform bill gave to Leeds the power of sending two representatives to parliament, and their choice fell upon Mr. John Marshall, and the now celebrated historian, Thomas Babington Macaulay. After two or three years of service Mr. Macaulay accepted a seat in the council of the governor-general of India, and a vacancy consequently occurred in the representation of Leeds, and Mr. Baines was thought by the majority of the electors to be a "fit and proper" person to succeed him. He consequently took his seat in parliament, and there he zealously and conscientiously discharged his duties. His principle was, "measures, not men;" and he appears to have supported those projects which commended themselves to his judgment by whatever party they were brought forward. Although he never dazzled the house with brilliant oratory, he frequently enlightened it in business-like speeches, hence he was uniformly heard with attention, and even respect. Three successive times was this worthy man returned for Leeds, and for eight long years did he thus serve his town and country. But now "his way of life" fell in "the sear, the yellow leaf," and his general health began to give way; he therefore, in 1841, felt it his duty to resign his trust; but his constituents did not allow him to retire without a handsome testimonial in "admiration of the integrity, zeal, and ability, with which he had advocated the principles of civil and religious liberty during a public life of more than forty years, and to evince their gratitude for his important services, as the faithful and indefatigable representative of the borough of Leeds in three successive parliaments."

retirement from parliament, Mr. Baines was necessarily much less active than in his earlier period, but he still discharged the duties of a magistrate for the borough, and of a Justice of the Peace for the West Riding, and even occasionally attended political movements and meetings. Like the "worn warhorse," he was in the sound of battle, and it was only the age of others that prevented him from being in the "tented field." But when the scene of conflict he might find the thought that he had represented it was his happiness to see his son, Talbot Baines, become eminent as a distinguished member of parliament as for Hull; while his second son, Edward, conducted the *Leeds Mercury*, and took an important part in the great educational reform.

draws to a close. In the winter of 1848, Mr. Baines became seriously indisposed, and made a final appearance on the bench with the judges, where his last effort was in the night, and relieving the distresses, and the poor. Alarming symptoms, which awakened the deepest concern, and his children's children, to enter "the chamber where the fate of his life," but suffice it to state that he died on August 3rd, 1848, at the age of seventy-four years and six

months. We somewhat departed from our plan in presenting so extended a notice of a man whose career is so fully and so ably recorded in the volume before us, but we do so, not merely to interest but to instruct our readers. We consider its careful perusal to stimulate to intellectual and moral advancement.

In the subject of our notice as the subject of our notice, diligently attending to his duties, carefully improving his leisure, and in we have beheld him as the man and the influential M.P.; and we find it too deeply impressed upon our minds that it was the course he pursued that led to the honours of age. Let this be remembered over, and it will suggest a salutary thought to youthful minds. "England! contemplate the up-coming of Edward Baines, and say if it is not worthy of emulation."

Our readers cannot but have been struck by the similarity between the life we have just read of the great American printer Benjamin Franklin. There were many points of resemblance in the mental character of the two men, and Mr. Baines, not inappropriately, the "Franklin of England." Nor was this resemblance fortuitous; for it comes out that from his youth he had the resolution of imitating Franklin.

The influence of this resolution cannot be estimated, but it was great; and we cannot express a better illustration of the influence of Franklin's life on Baines, so the example may be taken as a model by many of our readers.

Our remarks it would be an unpardonable omission if we did not record the deep

interest with which we have perused the volume before us, and express our opinion that it ought to find a place in the library of every mechanics' institution and mutual improvement society throughout the land.

The Life of Lord Jeffrey, with Selections from his Correspondence. By Lord Cockburn. 2 vols. Edinburgh: A. and C. Black.

This is a work that will be eagerly perused by all who are familiar with the history of our literature during the last half century. The name of Lord Jeffrey is indissolubly associated with the *Edinburgh Review*, and it was his connexion with this powerful serial that gave such interest to his life, and will give immortality to his memory. His merits as a private and professional man will be forgotten long before his influence as a writer will cease; and therefore in presenting a brief notice of his life we shall dwell more particularly upon this phase of it.

Francis Jeffrey was born in Edinburgh, October 23rd, 1773. At an early age he was sent to the High School, Edinburgh, and in his fourteenth year was removed to Glasgow College. He here enjoyed many educational advantages, and commenced the practice to which he steadily adhered, of taking full notes of all the lectures he heard—not mere transcripts of what the lecturer said—but expositions by the pupil, in his own language, of what he had meant, with discussions of the doctrines advanced. From his very boyhood he was not only a diligent but a very systematic student, and he formed very early the invaluable habit of collateral composition, not for purposes of display, but for his own culture. He has left behind him a mass of these writings, consisting of lectures, essays, translations, abridgements, speeches, criticisms, tales, poems, &c., and each one bears the impress of laborious thoughtfulness. It was thus that he laid the foundation of that character of mental acumen and literary exactness, which he afterwards so eminently sustained. Early in his sixteenth year he returned home, where he remained for the next two-and-a-half years, pursuing his studies alone, making translations, writing essays, composing speeches, &c. He next went to Oxford University, which appears then to have been surrounded with an uncongenial moral atmosphere, and he gladly removed from it, after a residence of only nine months. He was now nineteen, and his ideas about a profession began to take a definite shape. It appears that he had some thoughts of living by literature, and chiefly by poetry, but these were only the casual longing of taste, and not the prevailing views of his practical judgment. The law was plainly his destiny, and to its study he now devoted himself. He attended the Scotch law lectures of Professor Hume; those of Professor Wyld, on the civil law; and those of Professor Alexander Tytler, on history. As an illustration of his application, it may be mentioned that his "Notes taken from Tytler" occupy 436 folio pages of his writing, which would be at least double in ordinary manuscript. He now joined a celebrated debating society, known as "The Speculative," which was established in 1764, and exists at the present time. His biographer considers that "this did more for him than any other event in the whole course of his education." He was remarkable for his regular

attendance; he read several very able papers, and took a zealous part in every discussion. It may easily be supposed how exciting some of these debates must have been to Jeffrey, when it is stated that he had to struggle with Lansdowne, Brougham, Kinnaid, and Horner, who, with other worthy competitors, were all in the society at the same time. On the 16th of December, 1794, he was admitted to practise at the bar, and though it was a long time before he obtained any celebrity, yet he still pursued his studies, learning "to labour and to wait." Early in the year 1802, a small but important meeting of young men* was held in Mr. Jeffrey's "upper room," Buccleuch Place. The object was, seriously to discuss the practicability of a proposition made by Mr. Sidney Smith, for the establishment of a quarterly review, and it was acceded to by acclamation. It happened to be a stormy night, and this suggested many a joke respecting the greater storm they were about to raise. They had had little experience in writing for the press, and although Sidney Smith was the appointed editor for the first number, they evidently leant much upon Jeffrey's judgment. The first number was to have appeared in June, 1802, but it was postponed to September, and ultimately to October. Jeffrey's anticipations of success were not sanguine; in writing to a friend, he said, "Our review is still at a stand. However, I have completely abandoned the idea of taking any permanent share in it, and shall probably desert it after fulfilling my engagements, which only extend to a certain contribution for the first four numbers. *I suspect that the work itself will not have a much longer life.* I believe we shall come out in October, and have no sort of doubt of making a respectable appearance, though we may not perhaps either obtain popularity or deserve it." At last the 10th of October, 1802, arrived, and the first number of the *Edinburgh Review* made its appearance, containing seven articles by Smith, four by Horner, four by Lord Brougham, and five by Jeffrey, one of which, on the French Revolution, began the work. It is almost impossible for us to state the impression made by the new luminary. The learning of the new journal, its talent, its spirit, its writing, its independence, were all new; and it was a matter of increased surprise that a work so full of public spirit should spring up so suddenly in a remote part of the kingdom. Jeffrey gives some interesting particulars of the doings behind the scene; he says, "The first three numbers were given to the publisher—he taking the risk and defraying the charges. There was then no individual editor; but as many of us as could be got to attend, used to meet in a dingy room off Willison's printing-office, Craig's Close, where the *proofs* of our own articles were read over and remarked upon, and attempts made also to sit in judgment on the few manuscripts which were then offered by strangers. But we had seldom patience to go through with these, and it was found necessary to have a responsible editor, and the office was pressed upon me. * * * Smith was by far the most timid of the confederacy, and believed that unless our *incognito* was strictly maintained we could not go on. And this was his object for making us

hold our dark divans at Willison's office, to which he insisted on our repairing singly, and by back approaches, or by different lanes!" This was the modesty of true greatness. Jeffrey suffered not the same and occupation of the *Review* to draw him from his obscure professional practice, and at length advancement, and even popularity, came.

Jeffrey, at the age of twenty-eight, was married to an amiable lady, with whom for four years he lived in the enjoyment of the greatest domestic happiness. Her death, in 1805, appears to have given him the greatest shock he ever experienced, for he described himself as "the most miserable and disconsolate of men." But time healed the wound which death had made, and in 1813 he sought an alliance with another lady. The object of his affections had removed to America, but notwithstanding he entertained the greatest horror for watery adventures, *after making his will*, he boldly set sail, and ultimately returned with his "lady's love." He now continued with increased success his professional career, and still editing the *Review*, and writing many of the articles that enriched its pages, until in the year 1829 he was chosen "Dean of the Faculty of Advocates," when he withdrew from connexion with the *Review*, after having edited the 98th number.

When relieved from the anxious and incessant labour of the *Review*, he expected to spend the remainder of his life in comparative repose. But in December 1830, the Whigs came into office, and he, by pre-eminence, was appointed Lord Advocate. This gave an unexpected turn to his prospects and avocations; he had to go into parliament at a great pecuniary cost, for while his office realized about £3,000 a year, in eighteen months he spent about £10,000 in electioneering! If he made no great figure in parliament, he proved useful to his party in carrying their reform measures, and he was afterwards, in December, 1832, returned to the first reformed parliament for his native city—Edinburgh. But his parliamentary career was of short duration, for a vacancy occurred on the bench of the Court of Sessions, and he became a judge, and according to Scottish custom, assumed the title of Lord Jeffrey. The current of his life now flowed gently on, and though age brought with it some of its attendant infirmities, they were lessened by the ministrations of warm friendship and constant love. But ere long the end came, and he breathed his last on Saturday the 26th of January, 1850, in the 77th year of his age.

Even in this rude and hasty sketch of the career of a great man, our readers will discover much that is worthy of close and imitative study; here is another illustration of how mental discipline gives mental power, and how persevering industry, starting even from comparative obscurity, can attain to affluence and honour. Let our readers mark these things, and in them may there be realized the beautiful language of Joanna Baillie:—

"When thinking of the mighty dead,
The young from slothful couch will start,
And vow, with lifted hands outspread,
Like them to act a noble part!"

With respect to the work now before us, we need not make many remarks. With such materials before him the writer could not fail to produce an interesting book.

* Allen was 32, Smith 31, Jeffrey 29, Brown 24, Horner 24, and Brougham 23.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. IX.—ON STYLE.

"THE great art of knowledge lies in managing with skill the capacity of the Intellect, and in contriving such helps as, if they strengthen not the natural powers, may yet expose them to no unnecessary fatigue. When ideas become very complex, and, by the multiplicity of their parts, grow too unwieldy to be dealt with in the lump, we must ease the view of the mind by taking them to pieces, and setting before it the several portions separately one after another. By this leisurely survey we are enabled to take in the whole; and, if we can draw it into such an orderly combination as will naturally lead the attention, step by step, in any succeeding consideration of the same idea, we shall have it ever at command, and with a single glance of thought be able to run over all its parts."*

In our present prelection upon that power by which

"A drop of ink,
Falling, like dew, upon a thought, produces
That which makes thousands, perhaps millions, think,"

we shall endeavour as far as possible, by orderly arrangement, simplicity of treatment, and careful differentiation of one idea from another, to present such an analysis of our subject, complex as it is, clearly and concisely before you. It will then be your duty to synthesize our instructions, and, by the constant practical application of the whole of them, at once, and connectedly, while engaged in "shaping forth the lofty thought," make your words not only the distinct and transparent, but also the attractive and graceful medium of communicating your ideas.

Without further introduction we shall at present proceed to indicate the chief qualities which ought to distinguish Style, and the most important laws which ought to govern it, in so far as these relate to the structure of sentences.

A Sentence is any number of words so collocated as, by their combination, to form complete sense. Sentences are either simple or complex.

A Simple Sentence expresses one complete act of thought—consists of one distinct proposition, i. e., of a subject, copula, and predicate,† with their several necessary adjuncts.

THE SUBJECT may be—1st. Any noun or pronoun; 2nd. Two or more nouns or pronouns, so connected in sense that the predicate cannot be affirmed of each individually; 3rd. A noun or pronoun, with its adjunctive, explanatory, modifying, or dependent words; 4th. A noun or pronoun, and words placed in apposition to it; 5th. The infinitive of a verb, either singly or with its adjunctive, explanatory, modifying, or dependent words; 6th. A part of a sentence.

THE COPULA is always the verb *to be*; but this may be, and in general is, compounded with

* Duncan's "Logic," p. 37.

† See, for explanation and definition of these terms, "Art of Reasoning," No. V., vol. i., p. 139, 4th edition.

attributives to constitute a verb,* and may thus be, and in general is, employed in conjunction with the predicate.

THE PREDICATE, when not compounded with the copula, may be—1st. A noun or pronoun singly, or with adjuncts; 2nd. An adjective or present participle, singly or with adjuncts; 3rd. The infinitive of a verb, singly or with dependent words; 4th. A part of a sentence. When compounded with the copula, it may be—1st. Any intransitive verb or verb passive, singly or with adjuncts; 2nd. Any transitive verb, with its object and adjuncts.

Adjuncts consist of nouns, adjectives, pronouns, adverbs, and prepositions, with their governed objects.

The object of a transitive verb may be—1st. A noun or a pronoun singly, or modified by other words; 2nd. The infinitive of a verb, singly or with its dependencies; 3rd. A part of a sentence.

A Complex Sentence consists of two or more simple sentences, so combined as to make but one complete proposition, i. e., to express one complete act of thought regarding the thing spoken of.

Those simple sentences which unitedly form a complex sentence are called clauses. Clauses are either primary or secondary.

A primary clause, in general, expresses a complete idea, even when separated from the other parts of a sentence. It contains the leading affirmation in the sentence.

A secondary clause is a simple sentence, or part of a sentence, connected more or less with the primary clause, and is used to modify and explain it; it cannot, therefore, stand by itself, but must be joined to a primary clause.

A complex sentence must always contain one primary clause; it may, and frequently does, contain more clauses, which are independent of each other, and are called *co-ordinate*.

Clauses which are dependent on other clauses are called *subordinate*.

Primary clauses are always *co-ordinate*.

Secondary clauses are always *subordinate* to primary clauses, although they may be *co-ordinate* with one another.

Secondary clauses may also be subordinate to each other.

Primary clauses receive names according to the nature of their connexion with each other.

Primary clauses having the relation of equality are denominated *equivalents*; those which express opposition or contrast are called *antithetics* or *adversatives*; the former are introduced by *and*, *both*; *also*, *either*; *or*, *neither*; *nor*, &c.; the latter by *but*, *however*, *although*, *yet*, &c.

Secondary clauses are named—1st, from the nature of their connexion with primary clauses; 2nd, from the names of the parts of speech by which they are introduced.

Conditional clauses are those which imply condition or contingency; they in general commence with the conjunctions *if*, *unless*, *except*, &c.

Casual clauses contain a reason, and are introduced by such conjunctions as *for*, *because*, *since*, &c.

Inferential or consequent clauses denote an effect or consequence; *that*, *therefore*, *wherefore*, &c., introduce such clauses.

When comparison is expressed, as by *than*, *as*, &c., the clause is called *comparative*.

A concessive clause denotes yielding, or apparent yielding, or concession: *though*, *although*, &c.. are in general the introductive conjunctions.

Explanatory clauses may be introduced by a noun, adjective, pronoun, participle, adverb, or preposition.

When a noun in the nominative independent begins a sentence, it is called an *absolute* or *independent* clause.

When a noun or pronoun is placed in apposition to a preceding word or clause, the clause which contains it is called *appositive*.

A parenthetical clause is one enclosed in parentheses.

* See "Rhetoric," No. IV., p. 125.

Secondary clauses are also divided into adjective, relative, participial, and conjunctive, according as they are introduced by an adjective, relative, participle, or conjunction.

The following aphorisms may be found serviceable in guarding against errors in Style, or in giving information to such as are only beginning to engage in composition, viz.:—

- 1st. Be particularly careful in studying the subject on which you intend to speak, in order that you may possess a full and complete knowledge of it.
- 2nd. In the choice of words, endeavour to unite *reputable*, *national*, and *present* usage.
- 3rd. Give each word in a sentence its due grammatical or rhetorical relation.
- 4th. Avoid awkwardness or inelegance of expression, whether it violates the syntactical rules or not.
- 5th. Words necessary to the sense, harmony, or beauty of a sentence should never be omitted.
- 6th. Words which are unnecessary to the sense, or destructive of the harmony and beauty of a sentence, ought to be elided or amended.
- 7th. Carefully abstain from using the same word in the same sentence too frequently; especially avoid using the same word in different significations.
- 8th. Unnecessary transitions from one person or subject to another, as well as ambiguity in the syntactical relations of words, ought sedulously to be guarded against.
- 9th. Topics having little or no necessary connexion with each other, or that are capable of being considered in separate sentences, ought seldom, if ever, to be discussed in one sentence.
- 10th. When expressions are in all other respects equal, those which are most harmonious and pleasing ought to be preferred.
- 11th. When, of two words or phrases, the one is univocal and the other equivocal, the former should be chosen.
- 12th. Obsolete, obsolescent, harsh, ambiguous, quaint, low, technical, barbarously-coined, and solecistical words or phrases are reprehensible.
- 13th. Vulgar phraseology, or the language of low life, ought in serious composition to be eschewed.
- 14th. Easy, idiomatic, and colloquial diction is preferable to that which is heavy, poetic, and overlaboured.
- 15th. The one idea which we wish to express in a sentence ought to be gradually unfolded, satisfactorily dealt with, carefully elaborated, and the sentence ought to be free from anything that can retard or embarrass the intellect in its endeavours to comprehend it.
- 16th. The *protasis*, i. e., the former or forthstretching portion, ought always to excite expectation; while the *apodosis*, i. e., the latter or recurring portion, ought always to gratify it.
- 17th. Correspondence of purpose, quality, cause, effect, &c., should be expressed by correspondence of construction; and contrariety of purpose, property, origin, result, &c., should be expressed by an antithetical construction.
- 18th. Sentences ought not to be extended to a tiresome or fatiguing length by the mention of too many circumstances or objects, even though they be closely connected with

the principal clause or clauses; a little consideration will show how they may be arranged in different sentences.

19th. We ought to conclude as few sentences as possible with an adverb, a preposition, or any insignificant or unimportant phrase.

20th. A judicious intermixture of long and short words, phrases, clauses, and sentences, gives a pleasing variety, grace, and vivacity to style.

21st. Consecutive sentences ought, in general, not only to vary in length, but also, wherever it can be accomplished with due regard to perspicuity and the laws of speech, in syntactical arrangement.

22nd. Words having the same or nearly the same sound in their final syllables, ought as seldom as possible to be allowed to occupy consecutive situations in the same sentence or member of a sentence.

23rd. Consistency in the use of the numbers of nouns and pronouns, the moods and tenses of verbs, accuracy in the use of modifying inflexions, concord among the members of sentences, correspondence among correlative terms or phrases, and a regularly coherent dependency of structure and signification, ought to be carefully preserved.

24th. The collocation of our words should never be such as to present to the mind an inverted order of things, or a violation of the principles of reason and propriety.

25th. Words which signify ideas that are closely related to each other ought to be closely connected by collocation; in short, the order of our words should correspond with the order of our ideas.

26th. Words ought never to be placed in such positions with regard to each other as to give occasion to misapprehension; in such cases the juxta-position should be altered.

27th. Unintelligible or inconsistent words, and words or phrases not peculiarly adapted to the lucid and accurate expression of the meaning intended, must be carefully avoided.

28th. Everything which has even the semblance of tumidity, jejeuneness, puerility, affectation, stiffness, or incoherence, must be regarded as reprehensible.

The structure of sentences may either be grammatical or rhetorical: the former is the order in which words are placed in ordinary and unimpassioned speaking or writing; the latter is that method of collocating words, when not only thought, but also emotion and passion require to be represented in our speech or writing.

The chief laws relative to the position of words in grammatical structure are the following, viz.:—

1st. The subject generally precedes the verb.

The nominative may, however, be placed after the verb—(a) when the verb is neuter; (b) when the sentence is interrogative or imperative; (c) when the sentence begins with *here, there, thither, &c.*

2nd. The articles are generally placed immediately before the noun whose signification they define.

When, however, the noun is qualified by an adjective, the article precedes the adjective; but the definite article (*the*) is placed between the noun and the adjective *all*; the indefinite article (*a*) is put between the noun and the adjectives *many* and *such*, as well as between the noun and such adjectives as are preceded by *as, so, too, how, &c.*

3rd. Adjectives are usually put before the nouns which they qualify.

But adjectives follow nouns under the following conditions, viz.—(a) when some circumstance depends on the adjective; (b) when the adjective expresses dimension; (c) when it expresses the effect of a transitive verb; (d) occasionally when several adjectives belong to one noun; (e) when the adjective is employed as a title.

4th. Adjectives often follow substantive verbs, or past participles.

5th. Pronouns are placed inversely, i.e., the third precedes the second, and the second the first; and relatives follow their antecedents.

6th. Transitive verbs are generally placed before the words which they govern.

7th. The infinitive mood follows the noun, adjective, or verb, which governs it.

8th. Adverbs usually precede the adjectives, and succeed the verbs which they qualify; but if the verb have an auxiliary, the adverb may be placed between it and the verb.

Adverbs sometimes follow the objects of active verbs.

9th. Prepositions, in general, immediately precede the words which they govern.

10th. Conjunctions come between the words, phrases, or clauses which they connect.

The chief law regarding rhetorical structure is, place the most important words and phrases in those positions in which they will acquire the greatest prominence, and be most impressive.

To effect this, the following, among other variations of the ordinary grammatical structure are allowable, viz.:—

1st. The subjective may be placed after the verb.

2nd. The adjective, if emphatic, may be placed first in the sentence.

3rd. A transitive verb may be stationed after the nouns or pronouns which it governs.

4th. The infinitive mood may occasionally precede the verb which governs it.

5th. Adverbs, when very important, may be placed at the beginning of a sentence.

6th. Conjunctions necessary in ordinary grammatical structure may sometimes be omitted.

7th. When we are desirous of sustaining the attention, exciting the curiosity, as well as giving weight to the sentiments expressed, the most important words may be employed to close the sentence.

We have been thus minute—perhaps some may think tediously and minutely so—in opposition to a maxim too rashly adopted by Pope, from the Duke of Buckingham, viz.—

“Nature’s chief master-piece is writing well;”

but which he himself finds it necessary, in another part of the “Essay on Criticism” to contradict, saying—

“True ease in writing comes from art, not chance,
As those move easiliest who have learnt to dance;”

because we believe in the importance of trifles. We consider that nothing which hinders our sentiments from being properly appreciated, and gaining acceptance from those whom we address, is unworthy of notice, or undeserving of hard study to acquire the power of avoiding it. Seldom do we rightly estimate the value of those seemingly needless *minutiae* which appear so difficult to remember, and so hard to practise. But did we note rigorously how many of those who displease us, while hearing or reading them, from the inobservance

of little and apparently insignificant points—did we accurately observe how fastidious, nice, and critical we are ourselves inclined to be, and make up our minds to the belief that an equal, if not a greater degree of watchfulness and attention is being exercised upon ourselves, we would then most likely be impressed with the fact that “little things” are not so unimportant as we had imagined. Besides, a careful director ought to regard it as a duty to take every means to perfect his students in the minutest parts of their studies; for he will always be the most skilful person who is most sensitively alive to the slightest imperfections. We believe that, so far as regards Style, nature furnishes us with *all* the elements of which the art consists, but that these elements are not found completely and perfectly incarnated, so to speak, in any one object in nature. The mind culls from each the most pleasing qualities—those which are best fitted for the purpose in view; it observes, selects, judges, discriminates, systematizes, and legislates—it observes the individual qualities which objects display—selects those which appear admirable, judges of their propriety or impropriety—discriminates between the really attractive and the meretricious—systematizes or arranges these in the order of their relative importance—fuses and harmonizes them together, then gives these decisions forth as laws to be hereafter observed by all those who aim at perfection. Thus is Art called into being; thus are her laws formed; not arbitrarily and *à priori*, but by the strictest inductions regarding the pleasing, the useful, and the ideal. There are, indeed, some

“—— Nameless graces which no art can teach,
And which a master's hand alone can reach;”

but that, surely, is no reason why we ought not to pursue our researches as far as we can. It is not alone beauty of language, minute accuracy in its use, fine thoughts, perfect syntax, the glow of feeling, or the vivid expressiveness of diction, “but the joint force and full result of all,” that constitutes a good and pleasing style.

We have not composed this paper as it is without a purpose. We have noticed that, when many minute things are talked of in consecutive sentences and paragraphs, the individual instructions on each point which it contains do not *stand out* with full and just prominence before the mind, hence the aphoristic and disjointed style of the present article. We hope our purpose may be fulfilled, and that the distinctness thus artificially given to these remarks may aid in producing that distinctness in the mind which the importance of the trifles herein brought to view require, and that our students may be enabled to go on with us from perfection to perfection.

Philosophy.

IS WOMAN MENTALLY INFERIOR TO MAN?

NEGATIVE ARTICLE.—IV.

“Give me the liberty to know, to utter, and to ^{argue} one. We have now come to what will be
Freely, according to conscience, above all other ^{chronicled in the page of history as an event-}
liberties.” ^{MILTON.} ful and ever-memorable era, not only in the
THE present age is essentially a progressive political, historical, and philosophical, but

also in the social life of that bright "little spot"—so dear to all English hearts—our island home.

Free intercourse, free thought, and free action, are the mottoes inscribed on every heart. "Onward!" is the watchword:—

"The people's cry is—'Onward!'
The loud voice of their will,
Strung by a proud intelligence,
Is 'Onward—onward still!'"

The creed of the new age has been ably enunciated by Lamartine. To quote his eloquent exposition,—"*Its faith is reason; words are its organs; the press its apostle.*" Man has higher and nobler aims—more fervent aspirations—a deeper and stronger faith in PROGRESSION, than to believe that

"Tis better to stand still,
For to meddle is to mar;
Change is rash, and ever was so;—
We are happy as we are."

In the midst of this stirring spirit—this "world's awakening to industry"—this onward march of the mind, can we wonder that some questions which have long remained buried in that "night of lethargy and idleness, now rapidly passing away,"—others, which have never yet had a "clear field" and "fair play," should arise, and assume an importance never before practically felt? We have hailed, then, with pleasure and satisfaction, the *British Controversialist*, as providing the arena whereon mind may battle with mind, where the darling opinions and pet theories of man may be boldly confronted, and controversy carried on in that calm, yet forcible manner, so essential to the uprooting of error, and the establishing of truth.

The present question is one of those which has long been enwrapped in the mantle of prejudice—long remained ensconced in the almost impenetrable fastnesses of that rock, which, guarded with especial care and fondness by man, has been almost inaccessible to truth. It would have been our province to have torn from this question the mantle in which it had been so long enveloped—to have stormed the citadel in which it had so long remained entombed, covered with the "accumulated dust of ages;" but this, we think, has already been fully done by C. W., Jun., and by the talented and clever writer of the "Introductory Article." We shall, therefore, confine ourselves principally to a strictly impartial consideration of the arguments and assumptions adduced by some of our

opponents in support of the position they have taken in this interesting debate.

We propose first, then, to notice the arguments and assumptions of the writer who has taken for his motto the words, "Woman, beauty is thy power." Now, believing, as we most assuredly do, that there is power in the beauty of woman, and not altogether disregarding the possession of that power in man, we yet cannot agree with the *apparently* cherished opinion of "Senoj," that the power of woman lies wholly in her *beauty*; or, more than this, that woman is, as he would have it, mentally inferior to man. "Senoj," evidently intending to make his position impregnable, boldly tells us that "our conclusions must be based on the Baconian view of superiority being taken as the standard by which the case is to be tested;" or, in other words, the "fruits of the mind, as the fruits of all things else, are the only means of rational decision respecting the source of those fruits." So far the fabric built up by our friend is good; but we cannot say the same of the after-structure; and, combating "Senoj" on his own ground—fully and freely allowing that the "fruits of the mind are the only rational means of decision respecting the source of those fruits"—we yet think we shall be able to show that our friend has not made out a "clear and satisfactory case," and that he has taken an extremely one-sided view of the question. It needs not many words to substantiate this assertion; and we would not insult our readers by supposing that they have not already perceived this as well as ourselves; but we would ask their attention to the following part of "Senoj's" article, which we think fully corroborates our position. After deliberately making the assertion that "there is no way of estimating the superiority of one mind over another but that of concisely accounting for the labour which it performs, the effects, the 'fruits,' which it produces," "Senoj" maintains that "the point of controversy, then, is—Has woman or man wrought the greatest mental achievements? Are the chief literary productions, mechanical inventions, and scientific discoveries, to be, by the voice of the majority, awarded to woman?" Here, then, we say, is the proof of our assertion:—Does not the mind bear other fruits than those which may be classed under the name of 'literary productions,' "mechanical inventions,"

or "scientific discoveries?" Bold, we think, is the man who answers in the negative. "Senoj" has laid down a standard; but has he come up to that standard? Has he placed the "effects," the "fruits" of the two minds, side by side? Has he upheld these to our gaze in all their variety of action—dispassionately contrasted the one with the other, and pronounced judgment accordingly? We think not. On the contrary, seeming wholly to forget the standard set up by himself, he tells us that the "chief literary productions, mechanical inventions, and scientific discoveries, being by the voice of majority awarded to man," *he* must necessarily be superior to woman. Because woman excels not equally with man in these, she has a mind of an inferior order! Reader, what think you of this? Is it an enlarged and magnanimous view of the question? Is it placing the question on those grounds which harmonize the nearest with the principles of reason and justice? Our friend seems to have forgot entirely that (to use the words of C. W., Jun.) "diversity of power is no proof of inferiority;" and, inscribing on his banner "literary productions," "mechanical inventions," "scientific discoveries," sums up with the magnanimous declaration that, "in reference to mental superiority, there cannot, surely, be matter for contest and doubt." We have been thus particular in noting this part of our friend's argument, as it is generally the stronghold wherein the upholders of man's mental superiority ensconce themselves, vaunting the impregnability of their position. In their province (says "Senoj") the "power of woman's mind is peculiarly adapted for elimination." Perhaps it is; and, if we are not mistaken, the power of man's mind, in his province, is as peculiarly adapted for elimination as that of woman. Because we have a Shakspeare and a Milton, whom man seems as little likely to equal as woman, we are not, therefore, to conclude that the mind of man is not adapted for elimination. No! Passing onwards we meet with the following:—"It might be urged that nature, intending woman for a sphere diametrically opposite to that of man, formed her with a mind adapted for that sphere." We believe this to be the case; we ourselves urge it as true; and we challenge "Senoj," or any other detractor of woman's mental excellence, to

show us different; and further than this we urge—ay, and urge it as a fact incontestable, and one which will come unscathed from the severest test—that there is nothing in the whole range of speculative inquiry—of historical or philosophical investigation—which, brought to bear on this question, would lead any unprejudiced and earnest inquirer after truth to the conclusion that the all-wise and all-merciful Creator, in ordaining that woman should walk in a sphere essentially different to that of man, did at the same time intend this as a proof of inferiority of mind, or that she was to be considered in any way an inferior being. Our opponent next brings a very serious charge against woman; but one, happily, which is as unfounded as it is serious. After admitting that woman does possess sometimes (what he calls) an inordinate share of mental power, he says, that "when this power is possessed by woman we generally find it abused." However near or dear this creed may be to thy heart, "Senoj," do not, we entreat thee, seek to defend it, or to blacken woman's character, by first allowing her mental power, then asserting that it is generally abused. Generous man! We would have thee to go with us for a moment to those records of female talent which are furnished not only by this country, but by almost every other on the surface of the globe—to those whose names and talents are now shedding their lustre "o'er the intellectual world"—and how many, thinkest thou, will be found to have abused that mental power, which ought to prove a blessing rather than a curse? We have a Johanna Baillic and a Mrs. Browning, a Mrs. Rowe and a Miss Landon, a Mrs. Barbauld and a Mrs. Grant, a Mrs. Tighe and a Mrs. Radcliffe, a Miss Cook and a Miss Martineau, who, if she had written nothing more than her "Household Education," would have been entitled to the esteem of mankind; we have "a Catherine Philips, exhibiting the deceitfulness of pleasure; a Mary Chandler, proclaiming the blessings of temperance; a Lady Carew, enjoining the duty of forgiveness; an Amelia Opie, teaching the sinfulness of war; a Mary Howitt, sweetly sympathizing with the wants and sufferings of the poor," and hundreds of other familiar names, "bright and lasting;" and in all we shall find "a cheerful love for humanity, a noble trust in virtue, and a hoping, clinging,

earnest piety." So much, then, for our opponent's assertion of woman's abuse of mental power. Believing, with him, that "because such heroines as Grace Darling and Catherine of Russia have honoured the world, we must not presume that their sex are to fill the offices in which they shone," we yet think that these, and other names we could mention, show that, when necessity calls for it, woman can show courage equal, if not superior, to man, and that she is possessed of mental qualities which, when they have been called into action, have proved that she is not

" Such stuff
As dreams are made of,"

but equal, if not superior in many respects, to man.

Our next opponent's arguments, we fear, will find us very little employment; for, with the exception of one or two particulars, which will be noticed in order, we think his article would have read very well as a negative answer to the question before us. Passing over his introductory remarks, we come to the following remarkable argument in favour of man's mental superiority,—that woman, "by the extraordinary means of her creation, is entirely precluded from assuming a position of superiority over, or independence of, man, for she was actually taken from him, and must be considered a part of himself, and therefore inferior to him." What strange arguments are brushed up to defend a position which is "swiftly tottering to its fall;" a position which, ages ago, man himself, if he had not been blinded by pride, prejudice, and envy, would have condemned, and, when fully alive to the folly of an opposite course, would have been eager "to have shared with woman the throne of intellect"—to have given her free scope for the exercise of her mind—the cultivation and development of those noble intellectual faculties bestowed upon her; and in so doing would have given to her those rights which are her due, and from which she has been so long enviously withheld. But to our opponent's argument—"woman, by the extraordinary means of her creation, inferior to man." We cannot see any connexion between the "extraordinary means of woman's creation" and the inferiority or superiority of her mentality. Our readers, we feel assured, will instantly perceive the fallacy of this

mode of argumentation: let us follow it up, and see where it will lead us. Was not man's creation as extraordinary—yea, more so—than that of woman? Man was created from the "dust of the earth;" woman from man; and that man in the "image and likeness of God" himself. Our inference, then, must be, reasoning according to the mode of our friend "Vir," that man is inferior to woman, rather than woman inferior to man. Again, if we allow that woman is inferior to man, being taken from him, we must (pursuing the same course of reasoning) allow that man is inferior to the "dust of the earth," being taken from *it*. The one inference is as reasonable as the other. Passing, then, from this *stronghold* of our opponent "Vir," we are pleased to meet with the following assertions, which we think fully corroborate the truthfulness of our position. First, then, "Vir" allows that "woman, in her sphere, may fairly be presumed to possess ability and tact superior to man;" that the "mental superiority of man or woman cannot be ascertained from a partial or a one-sided view;" that "some women may possess capacity for learning and acquiring knowledge far superior to many men, and, had they the same advantages, might even surpass the opposite sex in many branches of literature. Poetically (our friend goes on to say) woman is often found to excel; in the finer feelings and sentiments of the mind she may, perhaps, be said to bear the laurels." What more, we ask, is needed to convince even the most prejudiced and dogmatic mind that woman is *not* inferior to man? But, following "Vir," we next stumble against his comprehensive summary, that "all these attributes, though beautiful and valuable, do not constitute mental superiority *in the sense in which we are bound to understand those terms*." If, in discussing this subject, we are all to have our own separate and distinct way of *understanding the terms superiority and inferiority*, we had better never have taken the pen in hand, for we shall never be able to arrive at a correct and satisfactory conclusion. "It is," says "Vir," "in the great powers of ruling, sound judgment, and discretion, that superiority of mind is to be sought." Now, we think we may, without much endangering our position, admit that, in the great powers of ruling, sound judgment, and, perhaps, dis-

cretion, man is superior to woman; but that woman, in consequence of not possessing these powers in equal development with man, is inferior to him, we emphatically deny; in fact, the possession of those "finer feelings and sentiments," which "Vir" himself has allowed to woman, tends very far to prove her equality with man; for we believe, with T. F. O., that the possession of these "superior moral sentiments and social feelings fit her in an especial manner for the highest of human duties—the exercise of moral influence or control over the passions of others." What man lacketh, woman possesseth; and what is wanting in woman, man can supply.

Our further remarks must, necessarily, be brief. Feeling assured, then, that our readers will attach the proper value to the arguments and assumptions put forth by our two opponents, "Senoj" and "Vir," we shall proceed to unfold those reasons which have induced us, after a careful consideration of the subject in all its bearings, to affirm that woman is *not* mentally inferior to man. That woman plays an important and essential part in society will not for a moment be questioned, even by her most invidious detractors; but that she is not equal to man in the exercise of those faculties which belong peculiarly to his sphere—that to her cannot be awarded the palm of superiority in those great mental achievements which require severe and prolonged thought—in the "great powers of ruling, mechanical invention, or scientific discoveries," we fully and freely admit; and yet even in literature, in "mental achievements," woman has won for herself a well-deserved fame; so high an eminence has she attained that we are left almost in doubt whether, if she enjoyed the same advantages as man, she would not surpass him in many of those branches of literature which he claims as peculiarly his own. It is true, we have no female Shakspeare or Milton; but what other great poets are there with whom we have not poetesses to compare? Have we not a Byron in Miss Landon, a Cowper in the Countess of Winchilsea, a Spenser in Mrs. Tighe, a Goldsmith in Mrs. Grant, a Johnson in Hannah More, a Wycherly in Mrs. Centlivre, a Collins in Mrs. Radcliffe, a Coleridge in Mrs. Browning, a Wordsworth in Mary Howitt, a Scott (and more) in Joanna Baillie? Or if it still be maintained that

some, or even all, of these ladies fail to reach the full height of the poets they resemble, where is to be found the dogmatist daring enough to say that the difference is sufficiently great to be set up as a mark of distinction between the one sex and the other? Woman mentally inferior to man? Is it not degrading to Englishmen—is it not a blot on the age in which we live—that so absurd a belief should be held by any? That our mothers, wives, sisters—that one-half of the human race—should be deemed to be endowed with an inferior kind or degree of intelligence to that which animates the remaining portion of the species, is a theory so monstrous that we can only wonder at even a savage age believing it. The mental constitutions of the two sexes are different; the spheres in which they move are essentially distinct (not antagonistic); but that this implies inferiority either in one or the other we cannot admit. "Man rules the mind of the world—woman its heart." Our opponents themselves have allowed that in many points woman is superior to man; and they have asserted that in others man is superior to woman. What, then, are we to infer from this? Obviously that what the one lacketh the other possesseth; that woman is in *no* way inferior to man; and that the "perfect character is only formed by the union of the two incomplete parts." The secret of man's power lies not only in the masculine formation of his intellect, but also in that of his body. Man is formed to command, to rule to exercise a palpable and wide-spread influence; to him "belongs the sway of force;" he more especially distinguishes himself in the senate, on the platform, in commercial and scientific pursuits, in the pulpit, and on the battle-field. The world looks on and admires the actions of man; the loud trumpet of fame is ever ready to sound for him whilst woman, putting forth her virtues, her talents, and attractions chiefly in the social circle, lives, we may say, "unnoticed and unknown" by the world around her. Woman sways the all-powerful sceptre of influence. "Her province is to soften, round off, smooth down, the irregularities of life and conduct—to act (gently but unceasingly) upon the swiftly-beating heart of the world, soothing it into calmness when violent, mildly stimulating it into action when torpid, and refining, purifying, and exalting its passions and a

pirations when excited. Home is her empire, and affection her sceptre. It is hers to endure, to watch, to suggest, to inspire, to re-invigorate, to sustain. It is hers to colour, and perfume, and beautify the way of life—to adorn existence and make it musical. It is hers to resist and counteract the deadening influences of the world. Man goes forth to his labour day after day; he performs, day after day, the same cramping round of duties; it is woman's office to preserve him from becoming a mere piece of animated, but spiritless mechanism. He comes in contact with villainy and selfishness; it is hers to keep alive in his bosom the generous flame of virtue. He falls in with the degraded and deceiving; it is hers to prevent their evil influence upon him, and to keep up a proper estimate of humanity. It is hers, when the world has disgusted him with its dullness, to restore him by the tranquil delights of home. It is hers, when misfortune overtakes him, to cheer him with hope, and support his sinking spirits. It is hers to preserve in their purity the moral sentiments of his nature. It is hers, while intellectual knowledge makes him wise, by moral persuasion to render him good. It is hers at all seasons to inspire him with a purifying love for the beautiful, and to anchor his soul firmly in the everlasting rock of religion." We have to thank Frederick

Rowton, author of the "Female Poets of Great Britain," for the above beautiful and eloquent lines on woman; and we would advise the stern dogmatist—the believer in woman's mental inferiority—to turn to the pages of that book, where he will see a "comprehensive and well-arranged gallery of mental female loveliness—every picture ranged with artistic skill in its proper light;" and we think we are not asserting too much when we say that he will be compelled to admit that he no longer disbelieves.

Having shown that our position is based on those principles which time itself cannot shake—i. e., Truth, Justice, and Right—we would conclude, earnestly impressing on every mind the importance of allowing to woman those rights from which she has long been withheld, and in so doing we shall reap our own reward in its "richest fulness," and be carrying out in practice what is expressed in the signification of those noble, yet much-abused words, "LIBERTY, EQUALITY, and FRATERNITY." Then,

"Hurrah for the mind-march!—the music
That stirs among nations of brave;
That wakes them to war by the spirit,
And sets up the soul o'er the glaive!
That sheaths the old sword of the tyrant
To revel in peace with the free,
And calls upon truth as its syren
To warble in liberty's tree!"

J. N. C.

AFFIRMATIVE ARTICLE.—IV.

"Neither reason nor Christianity invites woman to the professor's chair, nor conducts her to the pulpit, nor makes her welcome to the pulpit, nor admits her to the place of ordinary magistracy.

They forbid us to hear her gentle voice in the popular assembly, and do not even suffer her to speak in the church of God."—REV. J. A. JAMES.

"For the same reason they seldom succeed in long works, even on the subjects best suited to their genius, their natural training rendering them equally averse to long doubt and long labour."—LORD JEFFREY.

"Generally speaking, enlarged views of politics and science—the bold flight of metaphysics—the sublimer conceptions of poetry, which, bursting every shackle, soar in the boundless region of thought and imagination—are not in the province of woman."—MONOD.

THE question to be debated and decided is this—and preceding writers have forgotten it—not whether woman is *morally* inferior or superior to man, but whether she is *mentally* co-equal. Morality—and that is not the question—refers to the ethics, or the

doctrine of the duties of life; mentality is not a practical or external property, but is rather that faculty which thinks, studies, and meditates.

It has been urged, and with good reason, that judgments deduced from appearances are apt to be erroneous. To a certain extent this may be true; but it remains to be shown that, without other means by which to obtain correct opinions, all confidence in this precept is misplaced. There are but few persons who (while admitting the truth of that maxim) are not guilty of frequently ignoring it. There are, then, but two inferences to be drawn; viz., that such persons are grossly inconsistent; or that, while correct in its general acceptance, the application of the moral is unreasonable, unless there be certain infallible indications by which we are enabled to arrive at precise facts. And an

our whole assures us that there is no rule without an exception.

These remarks are intended to show, in order to determine the subject under discussion satisfactorily, the necessity, in the absence of more direct evidence, of an appeal to the mental productions of the female sex. Although we may have other means of illustrating or confirming our decision, this is the most simple, will admit of less misapprehension, and be considered, even by our female friends, as the best for arriving at legitimate conclusions.

It must be admitted that but few of the productions of the female sex are really substantial works; that is, they are confined to the fictitious class of literature. An appeal to any London daily newspaper will confirm this assertion; and I will venture to assert that five-sixths of the works advertised or reviewed will be of the class alluded to.

Now, the question may be asked, Why do you object to novels, &c.? is not there much benefit to be received from their perusal, and do they not often contain some useful moral? I reply in the affirmative; but I will put another query, and ask if there is none that can confer greater benefit on the reader than such a class of works as this? Need I refer to "Eliza Cook's Journal" and Mary Howitt's works as significant illustration of the truth of my position? There we have talent devoted to the best of purposes, and attended with less harm, and fear of alienating the moral faculties, than is consequent upon a perusal of novels; at the same time there is sound, elevating advice given to purify the mind, to ennoble the heart, and to render us better adapted for our several duties and stations in life. It should be the aim of all writers to depend as little as possible on the speculative and visionary, to avoid, as far as in them lies, any approach to the uncertain and phantom-like, and to shun all topics which are calculated to fill the mind with unreal and sophisticated notions. Cannot this be better attained than through the medium of novels? and cannot subjects be sought which will convey pleasant, though valuable, instruction, without involving the necessity of a perusal of some hundreds of pages in order to obtain it?

In making these strictures, let it be remembered that I make no reference to the character of talent displayed in the compo-

sition of such works; I pronounce no opinion on the genius displayed in the compilation of novels; I refer only to their particular constitution and subject matter.

The fact that a vast proportion of the productions of women are of the class of the novel and romantic, is certainly an indication of a prominent feature in their mental character, and hence the difference between the sexes. Whilst, with some honourable exceptions, the writings of our female friends are fictitious or imaginary, the productions of the male sex are confined to no class whatever, but are distributed over every department of literature—science, art, education, political economy, &c. &c. From this simple but veritable fact an inference may be manifestly drawn, which appears to my humble judgment to be correct, viz., that the mental character of man is more universal in its application, and hence a corresponding amount of mental power, of depth, concentrativeness, and continuity of thought is the necessary and indispensable accompaniment. If we survey the vast number of books which have been left as a legacy to future ages—if we carefully examine their divisions and subdivisions, the various branches to which they belong, the labour required for their compilation, and the intensity of thought which has been evoked, we cannot, I think, but conclude that the mental and intellectual capacity of man is superior to that of woman.

To mention the honoured names of those who have immortalized their names by their works would be useless. A little reflection, however, would immediately suggest the old Grecian and Roman philosophers, poets, historians, legislators, and senators, as well as those of our own country. We should be reminded of Lycurgus, Solon, Homer, Socrates, Plato—of Shakspeare, Chaucer, Milton, Locke, Luther, Newton, Byron, Marvel, Russell, Bacon, Cowper; and, of our own day, Macaulay, Carlyle, Foster, Smith, Emerson, Mackintosh, Washington Irving, Jeffrey, &c. Let it not be thought, however, that I am so partial to the male as to forget the writers of the "softer and fairer sex." It is with no small gratification that I add those of Queen Elizabeth, Mrs. Hemans, Fry, More, Hoffland, Barbauld; Mesdames De Staël, Somerville, Marcet; Miss Martineau, Eliza Cook, Mary Howitt, Madame de Seveigné,

Miss Edgeworth, &c. &c. And be it said that in enumerating these names there is the consolatory fact that the most of them are associated with works which, while of no common or mediocre character, are valuable, instructive, interesting, and abounding with fact and data profitable to all readers; herein consists their value and intrinsic worth—that such works may safely be placed in the hands of all readers and of all classes, be they young or old, grave or gay—good, solid, substantial truth is inculcated in them—it is with reverence, therefore, that I mention these authoresses; for we are all deeply indebted to them.

But I refer to the character of the subjects mostly sought by female writers in proof of the assertion that such compositions are not necessarily dependent upon intensity of thought or great mental power; in other words, they do not involve any close application to study. Unlike philosophical reasoning, it is not necessary to confine the mind to the demonstration of certain theories; for instance, a sermon is intended to illustrate the subject chosen; now, as all truth harmonizes, it is clear that the arguments advanced by the preacher must be sound, logical, and conclusive. It is not so with romance. Taste, in a great measure, varies, and hence the termination of a tale is as uncertain as the choice of the individual. Such works as novels are either founded on fact, or are unconnected with time or circumstances. The latter do not require searching investigation, minute inspection, or close application, in order to form the subject matter; in the former the groundwork is already laid, and only remains to be attired with such a variation of incident as may be most in accordance with the views, feelings, and desires of the writer. It matters not what the superstructure of the work be subsequently, or the materials of which it is composed; certain it is, facts are sought to form the foundation; the result is dependent upon the accidental, individual feelings which are common to the author. But on other subjects the difference between fact and fiction is great. Facts have to be obtained prior to any superstructure being raised upon them. These are not attained at hazard, or by chance; or, if they are, they have to be thoroughly investigated before any further progress is made. If this were

not so, future development would be at variance with them. "Facts are God's truths," and must harmonize, either separately or *tout ensemble*. We therefore see that philosophy is not indebted to fortune, but rather to the persevering efforts of men of learning, genius, and talent. It is not indebted to accidental circumstances, nor does it owe its present high position to the caprice of an individual: it is the result of intense application to study, combined with a due regard to discrimination and to a judicious selection of those facts upon which the superstructure is based. Hence the necessity for the accuracy and stability of the groundwork, lest by any means future development might prove the fabric to be of uncertain and untried materials. My readers will now understand the distinction which I have drawn—that, appealing to the writings of our female friends, we discover infallible indications of their taste for works of fiction—that the greater proportion of their writing is of the aforesaid description—that novels, whether historical or otherwise, do not necessitate intensity of thought and study—and that, while it is intended to convey some moral, it is not expedient that the author should demonstrate any truth, or follow and trace out the relation which such truths have in their application to other data and principles.

But, to examine this question in another light, what would be the result were woman's attention bestowed upon other subjects? Divinity, philosophy, science, art, politics, &c., are lost sight of by them. They produce no works on such topics. Some opponent may very properly ask if such subjects are fitted for woman to expound, or if she is gifted with those powers of mind which are suited for such questions; in other words, the query might be put, Does the mental power of woman demonstrate that she is peculiarly adapted to such pursuits? I reply, that, so far as I am able to judge from scripture, I do not discover that it was the intention of the all-wise Creator to endow her with such depth of mental power requisite for the subjects I have referred to—that He did not seek to place her in that domain, or fit her for such a sphere. On the other hand, I am impressed with the conviction that God adapted each sex to its own peculiar sphere, and accordingly appointed cer-

tain duties and stations for man and woman. I am further of opinion that, while the latter was not intended for mental and studious purposes, she was endowed with mental abilities proportionate to the duties which she was to be called upon to discharge; and that, as her field of action was to be of no mean character, but rather intended for the training of her offspring and the duties of the domestic circle, she was gifted and endowed with such mental and moral capabilities as were necessary to enable her to sustain with honour to herself, as well as with satisfaction to those around her, the heavy and solemn responsibilities which devolved upon her.

The relative position of man and woman, as set forth in holy writ, appears to sanction the assumption of man's mental superiority. St. Paul says, "Wives, submit yourselves unto your own husbands, as unto the Lord. For the husband is the head of the wife * *." And again, "Let the woman learn in silence with all subjection. But I suffer not a woman to teach, nor to usurp authority over the man, but to be in silence. For Adam was first formed, then Eve. And Adam was not deceived, but the woman being deceived was in the transgression." The natural inference consequent upon the perusal of these injunctions is, that man, by reason of the headship, possessed some qualification which the woman did not, or that he was endowed with a greater share of mental power than her. Is not this deduction reasonable? The greater should rule the less; and, as woman is dependent upon man for support, for which man himself is indebted to his mental acquirements, and feeling that his position in life is of great and paramount importance, from the risks he encounters, the difficulties he surmounts, the trials and misfortunes he undergoes, is it not fair to assume that her duties, momentous and important as they are, do not require so great an amount of talent and mental labour as that which is essential to the due discharge of the still more weighty responsibilities of the husband? I wait for reflection to suggest a reply.

As man is superior to woman in physical power, so he is in intellectual. Nature has proportioned woman's physical power to her mental capacity; and, as it is obvious that an unnecessary preponderance of either would

endanger the well-being of the other, we cannot, therefore, but conclude that woman is inferior in mental, as she is in physical or bodily force.

It has been urged, that if woman has not proved herself equal in respect to mental capacity, it is to be ascribed to the limited and inefficient education which she has received. Although it is deeply to be regretted that the accomplishments which she receives are not of that permanent or valuable character which they might be, yet it is to be doubted whether instruction would demonstrate her co-equality in respect to mental talent with that of man. Genius will develop itself in spite of the disadvantages of education. Watt, Galileo, Burns, Arkwright, Milton, and others, received little education, yet perseverance, patience, and industry crowned their efforts with success. If the mental character is of any worth it will develop itself, whatever be the obstacles which impede its progress.

In concluding this very complicated and certainly discursive subject, a few words suggested during the penning of this article may not be unimportant. It may, possibly, be thought by some (especially by the ladies) that I have been somewhat severe—that I have not made allowances for circumstances which are, unfortunately, associated with the sex—that I have not been as enthusiastic in applauding their virtues and literary excellences as I have been zealous in pointing out their mental deficiencies. To such I would reply, that I have only advanced what I conceive to be in unison with experience, and dictated by reason. The ladies must have been prepared to receive evidence coincident with that which I have tendered, or I should have withheld these remarks. I have not omitted to deplore the necessity for more education among females generally. In this age mere accomplishments are too often sought rather than solid, substantial knowledge. Music, dancing, drawing, painting &c., may be essential to complete the education of ladies, in order to enable them to amuse and to please; but let not that be forgotten which will please when beauty has faded, when the music of the voice is no longer charming to the ear, and that of the fingers is lost in the inability to appreciate sound—in a mind stored with knowledge and a character rendered precious by tho

traits which are the natural property of the female sex, and which fail not to win the admiration of all. Among men of sense and liberal politeness, a woman who has successfully cultivated her mind, without diminishing the gentleness and propriety of her manners, is always sure to meet with respect and attention bordering on the enthusiastic.

I have said that, so far as I have been enabled to judge, in respect to mental capacity, we must accord to man the palm of superiority. To the unequal, varied, and different standards of mental power which exist between man and woman is to be ascribed the present happiness which we enjoy, as well as the high position which is being attained in all things. As the vocations of man and woman are each adapted to dissimilar purposes, so has God ordained that the mental capacity of either sex shall be suited to its duties and stations in life. As man is called upon to discharge certain offices, so has his mental ability been fitted accordingly; and so it is with respect to woman; and, as the relationship of talent is varied, so it renders it a difficult matter to decide which is mentally superior. Their spheres of action, as their talents, are wisely qualified for different ends. I am not insensible to the value of female productions; and, speaking honestly, I believe some of the writings of our female friends to be fully equal in power to those of men. Oftentimes, when depressed by languor and exhaustion, I have sought relief in female writings, and drawn consolation therefrom. Feelings, dictated by a nature unknown to man, are there evoked, which cannot but have a beneficial and genial influence on his character. Morality is woman's domain; to teach, to instruct, and to edify the heart, is her peculiar sphere; and then, in those traits which so distinguish her sex—fortitude, long-suffering, kindness, forbearance, gentleness, patience, affection, and those moral faculties which have their seat in the heart—she excels. Her office is to teach the heart—to nurture it in the attainment of piety, order, justice, virtue—and to instil into the minds of the young those sound, but moral principles, which shall act as their guides through life. The domestic circle is her domain: there she reigns supreme. To comfort and to console the husband when misfortunes harass him—to cherish and invigorate his

spirit when cast down by trouble—to contribute her gentle counsel and encouragement when he is undecided what route to take—to share his hopes, his joys, his anxieties, and his exultations—to comfort him in the sick chamber—to add a balm to his wounded heart—appears to be her natural and loved province.

Our own happiness is bound up in her existence amongst us. The most delightful companion that we have, she can very often turn the scale of our destiny, for good or evil. As such great and incalculable results depend upon her, let us not be unmindful of her education and training, in order to avert evils which would be inimical to our moral and social well-being. The instruction of woman improves the stock of natural talents, and employs more minds in the elevation of the world; it increases the pleasures of society, by multiplying the topics upon which the sexes take a common interest, and makes marriage an intercourse of understanding as well as of affection, by imparting dignity, importance, and worth to the female character.

I must apologize for this digression from the more immediate subject under discussion; but as I considered that some remarks on woman, morally and socially considered, with passing hints on her education, were due from me; and as, after the strictures I have made, some apology was due for their severity, I thought it consistent with my subject, and just to myself, to express my sentiments on the morality of this topic, seeing that it is inseparable from the question of the mental capacity of the sexes.

A few words in conclusion, more especially addressed to the ladies, and I have done. If I have offered anything in this article which is in the slightest degree calculated to hurt their feelings, I sincerely ask pardon. Should they, on the other hand, suppose that I am in *any way* prejudiced against them, I beg to assure them that they are mistaken. I have endeavoured, honestly but conscientiously, to express my own convictions; and if I have advanced any *opinions*, or given utterance to any *sentiments*, which are *antagonistic* to truth and justice, *they are not to be attributed to the slightest prejudice on my part*, but to the *secret and intricate windings* of the theme before me, they having precluded me from arriving at conclusions

which (if the converse of my position be true, and providing that I entertained it) would have afforded me the gratification of according to the ladies a greater share of *mental* power than I at present believe them to possess, and would also have enabled me to add that there were good grounds for supposing (through scripture) that God had endowed both sexes with a co-equality of *mental* talent. Unhappily, circumstances do not impel me to take that view of the subject, and I feel persuaded that my female friends would much sooner pardon me for adopting *this* than the reverse phase of the question; as, however pleasing the latter view would be to my own feelings, any vindication of it would involve a violation of the true dictates of my conscience. J. G. R.

History.

WERE THE EFFECTS OF THE CRUSADES FAVOURABLE TO THE CIVILIZATION AND MORAL ELEVATION OF THE PEOPLE?

AFFIRMATIVE ARTICLE.—I.

"A nerve was touched of exquisite feeling, and the sensation vibrated to the heart of Europe."—GIBBON, "*Decline and Fall*," chap. lvii.

PHILOSOPHERS and historians have, in the question before us, found a theme both for learned disquisition and disputation, and also for sound reasoning and useful reflection; therefore it may not be unreasonable for us, in our humble way, to hope that the discussion in these pages may be fraught with some good. The question certainly opens a wide field of research for our young historical readers.

Did the Crusades promote the civilization and moral elevation of the people? We think so; and the reader shall have our reasons by which we have arrived at this conclusion.

The Crusades arose out of a *spontaneous*, and, so far as most of Europe was concerned, a *general* effort on the part of the human mind to get into action—to rid itself of the many fetters which had impeded its development. Circumstances were never more favourable for the attainment of this end than at the moment from which the Crusades date their rise. Chivalry was held in the highest esteem throughout most of the countries of Europe, and it only required to be animated by religious enthusiasm to call into existence a power which has never been equalled.

It was towards the close of the eleventh century that these two influences amalgamated. In the days of chivalry the outward

observances of religion, at least, were held in the highest esteem. It was customary for the Christians of Europe to make pilgrimages to the Holy Sepulchre; and so long as the caliphs of Bagdad, and after them the fatimides of Egypt, possessed Palestine, the Christians were not checked in this religious practice; but when the Turks had conquered Palestine, the hospitality of the Arabs gave way to the brutality of the new possessors, and religious pilgrims were subjected to the greatest vexations and annoyances. It was then that Peter the Hermit commenced his mission, and the eloquence with which he depicted the wrongs and cruelties sustained by the pilgrims did, indeed, create a sensation which "vibrated to the heart of Europe." The minds of the christian warriors became inflamed; and although at first they only demanded a free pilgrimage to the Holy Sepulchre, the contest soon came to be for the actual possession of Jerusalem.

The Crusades commenced, as we have seen, at the close of the eleventh century, and continued in operation for the two succeeding ones, during which time, either conjointly or distinctly, nearly all the great powers of Europe took part in them, and were therefore more or less brought into frequent contact with each other. There can be no doubt but that they exercised a vast influence, for good or for evil, over the destinies of Europe. We have said that we believe this influence was for good, and we shall now

proceed to quote our authorities in support of such belief.

We turn first to Gibbon, who, as our most philosophic historian, is likely to have given the question before us mature consideration. We find him obviously disposed to give no more credit to the influence of the Crusades than truth absolutely demands; but he makes the following admissions and declarations, which are abundant for our purpose:—
 "About the eleventh century the second tempest had subsided, by the expulsion or conversion of the enemies of Christendom: the tide of civilization, which had so long ebbed, began to flow with a steady and accelerated course, and a fairer prospect was opened to the hopes and efforts of the rising generation. *Great was the increase, and rapid the progress, during the two hundred years of the Crusades.*" Again:—"The larger portion of the inhabitants of Europe were chained to the soil without freedom, or property, or knowledge; and the two orders of ecclesiastics and nobles, whose numbers were comparatively small, alone deserved the name of citizens and men. This oppressive system was supported by the arts of the clergy and the swords of the barons. The authority of the priests operated in the darker ages as a salutary antidote: they prevented the total extinction of letters, mitigated the fierceness of the times, sheltered the poor and defenceless, and preserved or revived the peace and order of civil society. But the independence, rapine, and discord of the feudal lords were unmixed with any semblance of good; and every hope of improvement and industry was crushed by the mor weight of the martial aristocracy. *Among the causes that undermined that Gothic edifice, a conspicuous place must be allotted to the Crusades.* The estates of the barons were dissipated, and their race was often extinguished, in these costly and perilous expeditions. *Their poverty extorted from their pride those charters of freedom which unlocked the fetters of the slave, secured the farm of the peasant and the shop of the artificer, and gradually restored a substance and a soul to the most numerous and useful part of the community.* The conflagration which destroyed the tall and barren trees of the forest gave air and scope to the vegetation of the smaller and nutritive plants of the soil."

Hume, the great English historian, bears testimony to the good services rendered by the Crusades in arousing mankind from that state of degradation into which they were rapidly falling at the period of their commencement. He says, "Europe was at this time (1096) sunk into profound ignorance and superstition: the ecclesiastics had acquired the greatest ascendancy over the human mind. * * * *All the great lords possessed the right of peace and war: they were engaged in perpetual hostilities with each other: the open country was become a scene of outrage and disorder: the cities, still mean and poor, were neither guarded by walls nor protected by privileges, and were exposed to every insult: individuals were obliged to depend for safety on their own force, or their private alliances; and valour was the only excellence which was held in esteem, or gave one man the pre-eminence above another.* When all the particular superstitions, therefore, were united in one great object, the ardour for military enterprises took the same direction; and Europe, impelled by its own ruling passion, was loosened, as it were, from its foundations, and seemed to precipitate itself in one united body upon the East." Surely it was time for some change! But to our next authority.

"Better," says Macaulay, our fireside historian, "that the rude inhabitant of the North should visit Italy and the East as a pilgrim, than that he should never see anything but those squalid cabins and uncleared woods amidst which he was born. * * In times when statesmen were incapable of forming extensive political combinations, it was better that the christian nations should be roused and united for the recovery of the Holy Sepulchre than that they should, one by one, be overwhelmed by the Mahometan power. * * * Its effect was to unite the nations of Western Europe into one great commonwealth. * * * Thus grew up sentiments of enlarged benevolence." Again:—"The islanders returned with awe deeply impressed on their half-opened minds, and told the wondering inhabitants of the hovels of London and York that near the grave of St. Peter a mighty race now extinct had piled up buildings which would never be dissolved till the judgment day. *Learning followed in the train of Christianity.*"

Guizot, in his "History of Civilization in Europe," takes a still more extended view of the subject, and all who feel any interest in this question should read and study his chapter on the Crusades. Confirming the dark picture already drawn by the historians we have quoted, of the state of men and morals previous to this time, he remarks, "The main characteristic of the Crusades is their universality. All Europe together took part in them; they were the first European occurrence. Previous to the Crusades, Europe had never been moved by an identical sentiment, nor had acted in one and the same cause; *there was, in fact, no Europe. The Crusades unfolded a Christian Europe.* The French formed the bulk of the first army of the Crusaders, but there were also Germans, Italians, Spaniards, and Englishmen. Take the second or the third Crusade, all the christian nations were engaged in each. Nothing similar had ever been witnessed. This was not all. In the same manner as the Crusades were an European, so were they in each country a national event. In each nation all classes of society were animated with the same conviction, obeyed the same idea, and abandoned themselves to the same enthusiastic impulse. Kings, lords, priests, burghers, husbandmen—all took the same interest and the same share in the crusades. *A moral unity amongst the nations broke forth, a fact as novel as the European unity.*" And he continues:—"When such events occur in the youth of nations, in those times when they act spontaneously and from free impulse, without premeditation, political intention, or governmental combinations, we acknowledge them to be what history calls heroic events, and to evidence the heroic age of nations. *The Crusades were, in fact, the heroic era of modern Europe, a movement at once individual and general, national and yet unguided.*" And now for the more direct beneficial results. "It is," says Guizot, "more commonplace to say that the mind of a traveller is set free, and that the custom of comparing different nations, manners, and opinions, expands the ideas and clears the judgment from ancient prejudices. *Now the same fact occurred to these travelling populations who have been called Crusaders; their minds were opened and elevated by the mere circumstance of witnessing a multitude of different things,*

and by becoming acquainted with manners distinct from their own."

Listen also to one of the most learned men of which France can boast, M. Abel Remusat, whom Guizot quotes in support of the opinions above advanced:—"All these unknown travellers carrying the arts of their own countries into distant lands, brought back others not less precious, and made, without perception on their parts, more advantageous exchanges than all those of commerce. By these means not only the trade in silks, porcelain, and Indian commodities, became extended and more practicable, opening up new routes to commercial industry and activity, but—what was of still greater consequence—foreign manners, unknown nations, and extraordinary productions, crowded upon the minds of Europeans, repressed since the fall of Rome into too narrow a circle. They began to estimate properly the finest, the best peopled, and the most anciently civilized of the four quarters of the globe. They set about studying the arts, creeds, and idioms of the nations who inhabited it, and there was even a project for establishing a chair of the Tartar language in the university of Paris. Romantic accounts being soon investigated and valued as they deserved, spread on all sides more just and comprehensive ideas. The world seemed to open on the side of the East; geography made a prodigious stride; and an ardour for discoveries became the new direction which the adventurous spirit of Europe fell into."

Maunder, one of our modern writers, thus expresses himself on the same subject:—"By means of these joint enterprises the European nations became more connected with each other; feudal tyranny was weakened; a commercial intercourse took place throughout Europe, which greatly augmented the wealth of the cities; the human mind expanded; and a number of arts and sciences, till then unknown by the western nations, were introduced."

A writer in the recent edition of the "National Cyclopaedia" also gives us his testimony on the same side:—"It cannot be denied that the Crusades were accompanied by many beneficial effects. Such, for instance, were the increased activity of political life in Europe; the breaking up of the feudal system, by the sale of estates to the mer-

chants in exchange for the money required by the nobles for their military accoutrements and provisions. The increased wealth of the mercantile towns in Italy, which led to the revival of the fine arts and sciences in that country; and, finally, the diffusion of more liberal modes of thinking in matters of government and religion, occasioned by the intercourse of the western and eastern nations."

Enough of proof, so far as proof can be obtained, has been adduced for our present purpose; and we have now simply to anticipate one or two of the usual objections urged against our view of the case, and then leave the question for the present in the hands of our readers.

It has been frequently urged, that whatever good resulted from the Crusades was simply accidental, being neither sought after nor expected. It would answer the present inquiry simply to show that, in the end, no real harm ensued. But we prefer to deal liberally with the question. So long as any obscurity attaches to the *real* origin of the Crusades, so long they will remain liable to misconstruction and misrepresentation. We say the "real origin," because we look upon the spirit which first animated the Crusaders as distinct and apart from the recovery of the Holy Sepulchre from the hands of the Infidels. The *real accident* was the occurrence, at the precise moment, of a pretext to give colour and scope to the great drama ready for performance. We believe the true

mission of the Crusades was the emancipation of the human mind. It may be that this mission was only *felt*, and *not acknowledged*, by the immediate actors; but, nevertheless, it was well and nobly performed.

Lastly, there are those who become so completely absorbed in the contemplation of the horror and misery which naturally attended such perilous expeditions, that they entirely overlook the final result. "Look," say they, "at the immense sacrifice of human life! See the immense amount of property lost in the undertaking, and the consequent amount of misery and destitution which must have followed." Remember, reader, however much you may deplore the fact, that in the early progress of European civilization and liberty you have the din and horrors of war ever ringing in your ears. Happily, those days have passed away; but, for this very reason, measure not the past by the standard of the present.

"Time changes much the surface of the world!
Where once the Roman marshall'd his bold
host,
Bristling with swords and spears the rocky
height,
The shepherd tends his flock, and the young
lambs
In sportive gambols tread the flow'ry turf."

He, it has been said, who would understand history aright, must transport himself in imagination to the scenes and times narrated. Let this be done in the present case. We ask no more: we shall be content with no less.

C. W., Jun.

NEGATIVE ARTICLE.—I.

Is looking abroad upon the present state of the people of Europe, and comparing that state with the accounts which have been transmitted to us from the eleventh, twelfth, and thirteenth centuries, we find that nations which were then semibarbarous have become civilized; that those who "sat in darkness and in the shadow of death," have seen a great light—the light which is emitted by the Sun of Righteousness; that those who were captives—slaves, under the hands of feudal lords, have gained their liberty, to a very considerable extent, and are in a fair way for rendering that liberty complete; that the popedom, which at that time ruled the nations with an iron rod, has lost a very considerable portion of its power, and some of the nations

have even dared to think for themselves in matters of religion, so far as to set up rival systems, and that thus, instead of uniformity, diversity has become the order of the day; and, further, that in those cases in which nations have diverged most from the standard of opinion, the happiest effects have, for the most part, resulted.

It is but natural, in looking upon the changes which have thus taken place, and the progress which from time to time is being made, to inquire into the causes which have been at work, and to which this transition and progress can fairly be attributed; and closely to canvass the claims of every fresh candidate who steps into court and demands to share in the honour.

The candidate whose claims come under consideration at the present time, is that series of wars which was begun in the eleventh, and continued to the middle of the thirteenth, century, and which, owing to the circumstances of its being fought under the standard of the cross, has been designated the Crusades.

The seat of these wars was Palestine; their object the recovery of that country, or more particularly of Jerusalem, from the hands of the Turks, in order that free access might be given to the pilgrims of different nations who professed the christian religion, and who went to visit and pay homage in the place where the Saviour lived and suffered; and the aggressors were persons from most of the countries of western Europe, but principally from Germany, France, and England.

The Crusades were conceived in error, carried on in madness, and ended in disaster. They originated in the idea that a pilgrimage to Jerusalem could cancel the sins of a vicious life; that to fight in defence of religion is a most sacred duty, and to kill an infidel is an acceptable religious service. They were carried on at the most reckless expense of property and life; for, while the nations who engaged in these wars were impoverished, not fewer than two millions of precious lives were sacrificed. And they ended by leaving the very object for which they were undertaken, as far from being accomplished as when they were commenced.

And what did the nations of Europe get in exchange for so much money and blood? The various orders of knighthood are said to have been originated, surnames and heraldry instituted, and the rough German to have first conceived a taste for the arts.

Allowing that these, especially the last, may have done somewhat to promote civilization, it must still remain a question whether the habits which they who had the good fortune to return, had contracted during the wars, did not far more than counteract all the good which resulted. As far as our own country was concerned, the evidence of history appears pretty conclusive: beside suffering from the absence of her king, who was honoured to share in the war, and being well fleeced, first for the expenses of the war, and then for the ransom of the sovereign, the

state of society in England, during and after the Crusades, appears to have been of the most unhappy description. The circumstance that, out of a reign of ten years, the king spent but little more than four months in his kingdom, and in the midst of his people, together "with the fact that his whole life was spent in war, or in preparation for war, will prove that the internal state of the country was anything but satisfactory. A people who were called to look upon the whole of Europe as one great arena for royal gladiators—a people so familiar with war and blood—a people whose resources had been drained, and whose property and life were held of comparatively little value, were not likely to make much progress in civilization and refinement; yet who can doubt that a progressing and uplifting civilization would have done more for humanity and religion, than the most successful crusade that ever was undertaken?"*

If the introduction of the arts, through the Crusaders, may have done somewhat towards civilizing the people, the very fact that the Crusades were wars, is a fearful one to counterbalance this circumstance. "There is nothing improving, nothing elevating in war." While it is being carried on the worst passions of humanity are excited; and when it is over, and there is no common enemy against whom to exercise it, it is brought to bear against friends and neighbours. It is but a narrow view which men take of war to suppose that the entire loss of the conquered is included in the sum of men and money which may be expended; to this must be added the depreciation which the morals and manners of the people undergo for at least some fifty years after. Perhaps it would not be too much to add to this account a large proportion of the criminals which from time to time inhabit our prisons: for if it be right to rob and murder innocent persons of another nation, it cannot be far wrong to treat similar persons of our own country in the same manner. While governments make use of soldiers to do the one, it is only reasonable to suppose that the soldiers, after being discharged, will not scruple to do the other. Add to this the sum of the other evils which usually attend the camp, and which are as usually indulged in after a war, and it may

* Dr. Ferguson's "England."

be fairly questioned whether any accidental good which may accrue from war is sufficient to compensate for the certain evil.

Taking this view of the matter, we are led

to conclude that, on the whole, the effects of the Crusades were not favourable to the civilization, much less to the moral elevation, of the people.
G. N.

Politics.

OUGHT MONEY TO BE INTRINSIC OR SYMBOLICAL ?

INTRINSIC.—CONCLUDING ARTICLE.

THIS discussion now approaches its close. With this number the final dialectical *passes* between the principals will be exchanged, and thus will have ended this political

"Duel, in the form of a debate—

The clash of arguments, and jar of words."

John Bull is the next actor on the field. *Himself* his own hobby, and his "pocket" the hallowed *sanctum*, to give his decision as umpire must be a vital act. But finance is the riddle of his life—a "will-o'-the-wisp" which sometimes produces ridiculously blundering effects. Luckily, as to the present question there can be no fear of his safety. He is a stout hater of "sweeping changes," and his verdict against "shadows," "flim-sies," or *precious* paper money generally, will be but another repetition of former decisions. Old opinions are strengthened by opposition. So with old systems. But, happily, debates like the present are healthy forerunners of reformation.

Satisfaction cannot but be felt at the spirit in which our question has been met and answered. On both sides there has been no lack of sincerity blended with courtesy. But, though our opponents have enforced respect for their arguments, they have not obscured our perception of the fallaciousness which clings to them.

Among our opponents' views are some having a spiritual cast. These deserve prior consideration and settlement. J. H. and James Harvey, who may be one and the same person, are their sole promulgators. Starting from a point as sublime as it is benevolent, J. H. would institute symbolical money because it would be a practical solution of the vague problem, how the rights of labour are to be reconciled with the rights of property. England, it seems, has bungled,

and is still bungling, about this problem. "What," he asks, "is free trade, or the education question—the former 'a doubtful benefit,' producing insignificant fruits!—compared to 'the question of employment for the people?'" Statesmen, political economists, even prophets, have neither seen nor foreseen the true social panacea; but, as discovered by J. H., it is the plenteous manufacture of money. He would have money plentiful enough to *pay* for the employment of all, fallaciously thinking it would *cause* the employment of all. Resting on the many suppositions that money is something more than the *organ* of demand—that supply can never be in excess of demand—that "cheap money and dear commodities" are preferable to "dear money and cheap commodities" (in the same way that a circular pound weight is preferable in accuracy to a square pound weight)—J. H. and James Harvey prophecy, as incident to abundant symbolical money, that "every man should be at work, every steam-engine in full operation—that poor-rates might be annihilated," &c. Does not the millennium *now* clearly "loom in the distance?"—

"When every transfer of earth's natural gifts
Shall be a commerce of good words and works"—
(SHELLEY)

when Hobbes' antithesis may be read—
"Money is the *words* of wise men, and the
counters of fools?"

"Oh! happy earth, reality of heaven!"

After this it would, indeed, be strange if we had not a "religious element" in our discussion. Mr. Harvey readily introduces one. He, evidently, is less an advocate for a purely symbolical currency than an abhorrer of gold. He is a sincere mammon-hater. "As Egypt chose an onion for a god," so he personifies

gold and intrinsic money generally as the great arch-distributor and father of filthy lucre and venal corruption. "Gold money," he says, "has been an unmitigated curse to the people of the earth," and "is typified in the worship of mammon, denounced in scriptures." But will paper money elevate humanity to a purer spiritual state? Will the miser's soul be quenched, or the organ of acquisitiveness never be abused, when once this paper-pound panacea for human depravity is instituted? To some "the very light of heaven is venal;" but Mr. H. apparently abnegates this quality to paper money. Not so thought the satirist:—

"Blest paper-credit! last and best supply,
That lends corruption lighter wings to fly."
POPE.

But politico-economic science admits not of the introduction of either utopian or religious elements. The sound sense of our readers will, we trust, cause their eschewal, and so fit their minds for more legitimate argumentation. And, first, we must express our surprise at Mr. Harvey's nervous repudiation of our doctrine that "the true theory of the currency can only be that which practice has taught us." Why, it is upon this very doctrine he reasons against intrinsic money. Arguing from financial history, he infers the nation-saving utility of symbolical money. France, America, and Great Britain, he asserts, were saved from ruin in momentous exigencies—the first by its assignats, the second by its continental money, and the third by its restricted cash payments. Yet he scouts experience as a tester of seemingly theoretic truths, and in a lively strain of analogical ridicule crushes the great doctrine upon which we had fondly built, and from which he draws all his condemnatory inferences. Nevertheless, he will catch at a straw. "Practice is not altogether against us!" he exclaims; as witness the exchequer tallies, or wooden money, which once existed even in this country, and which was a symbolical money, and for internal uses. Why, our opponent must have forgotten that the money of most savage races is also mere tokens. So with them, indeed, practice is not against him. But how happens it that, with civilization, money invariably advances in intrinsicity or worth; and that everywhere, in great emergencies, that money-characteristic is departed from, a resumption

is always consequent upon the decadence of the forth-calling emergencies? We will not say "a divinity has shaped" these ends; but it is none the less true that exchequer tallies, assignats, continental money, and inconvertible British paper money, now rank among the things that were.

Mr. Harvey, apparently, has yet to learn that there are such distinctions as a natural and an unnatural demand for money. An intrinsic currency, we confess, as it is the growth of political nature, can do little more than answer natural political requirements. Its expansion *follows* the expansion of production and commerce. Like its antecedents, therefore, it is of slow development. The individual in want of sustenance must work for it; when in want of money, he must do the same. If his expenditure, whether conducive to future gain or not directly productive, is great, he must by labour, skilful outlaying, and careful husbandry, first acquire the necessary means; but if, like the spendthrift, he live and purchase expensively upon credit alone, he is a non-producer, and is pursuing a course equivalent to circulating a false or factitious money, *having no prospective value*. He is a non-producer, because he wastes commodities, and neither multiplies his own nor his neighbour's stock. Of course, as it is with the nation, so it is with the individual. Now, it is remarkable that transitions from an intrinsic into a symbolical currency have always been the temporary resort of states in this condition of spendthriftcy. When France became "a nation of soldiers" it required an artificial money, not the growth of labour, to pay for sustenance and the expenses of gigantic enterprizes, increased in price as they must have been by the scarcity of labour. The credit upon which the assignats obtained currency hung upon the bloody points of Gallic bayonets. Armies are non-productive; they waste particular commodities without ever adding to the general stock. Moreover, they drain their own countries of their intrinsic money to pay for what they consume in other states; for the credit which forces the circulation of factitious money at home is *effete* abroad. From these facts our readers will easily understand the true ground upon which rests Mr. Harvey's boast that non-intrinsic money "saved" America, France, and Great Britain, when bending under their unnatural loads of enor-

mons expenditures. But we little fear that, in these temporary money transactions, they will recognise the symbolical theory of the currency as the one which recorded financial experience tells them is founded on truth and the fitness of things.

We are now naturally led to the most conflicting point in our discussion—that of “scarcity of money.” It is the main pivot round which revolve our opponent’s fallacies. The term sadly wants definition. Sometimes it is used for scarcity of bullion; sometimes it is applied to a rise in prices; and sometimes it is used to express some vague notion of a limited circulating medium. Money-symbolists are never more fallacious than when condemning gold money, because its increase in quantity is not so proportionate with the increase of commodities that no fluctuation of prices can accrue. Their blunder consists in confounding a nominal with a real value. The real value between the media and the article of purchase is irrespective of the relative quantities of either. “The abundance of currency in the markets,” says Mr. Attwood, “has the very same action in raising prices as the scarcity of property has; and the scarcity of currency in the markets has the very same action in lowering prices as the abundance of property has.” But upon this point F. F. has already fully and clearly enlarged. No system of symbolical money has ever yet been mooted that could entirely obviate the fluctuation of prices; so that evils incident thereto must ever be tolerated so long as the scarcity and overplus of commodities in proportion to the demand are affected otherwise than by the current value of money.

We feel our position too strong, as respects the lesson to be drawn from the history of the disastrous results of a contraction of the currency in 1816, alluded to by “Irene,” to enter into lengthened argument. The 6,005 bankruptcies consequent on this collapse tell not in the least against an intrinsic currency. We advocate no reduction in the quantity of the circulating medium; nor have we yet seen cause to “sweep away the whole stock of our paper currency.” But the principal argument of “Irene” is, that “money possessing intrinsic value has a natural tendency to create those disastrous commercial panics which in previous years have brought this country to the very verge of revolution.”

This is strongly and boldly stated; but let us see how it is supported. It is because of the fixity in the value of gold, and because in prosperous times of “high prices and large profits,” this fixity of price in gold is the cause of “a drain of the metal from the country.” How? Because gold then “becomes the cheapest commodity we have,” and is, therefore, exported by the foreign merchant in exchange for his imported goods. What is here meant by “cheapest commodity” we are puzzled to say. “Irene” does not mean that the foreign market price of gold has risen above our standard price, for some checked home influence seems implied. Most likely his meaning may be, that, amid a general rise in the prices of other commodities, it is most profitable to the foreigner to take that particular commodity whose price has not proportionably risen. But what unknown causes are they which make gold money and commodities *dear alike*? Dear money and cheap commodities, and *vice versa*, we can understand; but, aware of the fixity of gold money value, dear money and dear commodities, coupled with high profits, go beyond our comprehension. Even admitting the “sole legal tender” to be cheaper to foreigners than any other of our commodities—not because there is any difference in its value in the two markets, but because the other commodities are dearer in our market than in the foreigner’s—this inequality could not be of long continuance. The equilibrium of prices, through the action of a free commerce, would speedily be restored. The drain of specie would, by limiting partially the circulating medium, lower the prices of commodities to those of other markets, without necessarily lessening the profits. But, in reality, “Irene’s” argument, even if tenable, is of insignificant importance. His so-called “fair transcript from the page of English history,” loses all its force as an example by the accurate explanation. The memorable panic of 1825 was distinguished and maintained by the want of a single commodity,—gold; and it is true that the missing gold was exported: but, primarily, the panic arose from the great mania for speculation in foreign loans, in costly joint-stock-company undertakings; also from an overplus of British manufactures in foreign markets, and from the failures of numerous private country bankers, who so far transgressed the law of intrinsic

currency, as to engross the whole circulating medium of their districts, without possessing sufficient capital to meet demands.* Thus great, indeed, were the ruin and havoc among incomes and fortunes; and not even "Irene" could resist the temptation of exposing a system under which such financial tragedies occurred. But "Irene's" primary argument having failed, so also does his secondary one, that, under a representative currency, foreigners would take our goods instead of our gold, because, at the then market price, he asserts, our gold would be less advantageous to foreign merchants than our goods. Certainly our opponent plays the dangerous game of vaticination boldly and positively.

Space, however, forbids prolonged debate. We will not call our reader's attention to Australia, or speculate on that apparently endless theme. Be the results of the insane scamper for gold as they may, the general argument on this question will scarcely be affected. But of Australia we think, that, considering the numbers finally destined to people it, their poverty, their distance from their old houses—the fact of other pursuits being sacrificed to gold-digging, and healthy comforts to life-shortening privations—the

importance of the country as a promising field for colonization and even incipient nationalization—there need be less apprehension for either extraordinary fluctuations in prices, or any undue alteration of the present standard value of gold at home.

We will now conclude. We have replied according to the manner in which our opponents have treated the question. Nothing has been said by its advocates in favour of a symbolical currency which can, we think, justify its institution. C. E. R. would make it an entirely inconvertible currency, representative only of "a certain quantity and description of labour at the time of the basis being fixed." This "symbolical money" he would base, we see, limitedly upon production, but he has no better plan of *expounding* it with production than through the imperfect medium of discounting bills of exchange. But if our readers would have a currency that represents and expands with labour—one which is of universal value, which can force a free-trade for itself, the fixity of which ensures its invariability, as a measure of value, and which is not dependent upon forced credit or arbitrary authority to ensure circulation—then let them give their verdict for intrinsic money.

R. L. G.

SYMBOLICAL.—CONCLUDING ARTICLE.

It has been conceded by many bullionists, that if paper could be limited in amount, it would serve as a money equally as well as gold; but their fear—a very natural one, a fear which arises from a dread of disturbing the relations of debtor and creditor, a fear for which I have every respect—is, that paper would be issued in excess. This is the weak side of paper money, and I would assent to the most stringent regulations which could prevent a baseless issue. But paper may be so issued as to be more valuable than gold, as M'Culloch confesses in his "Commercial Dictionary," when he tells us that, in the Bank Restriction Act, Mr. Pitt did not issue paper enough, and his notes were worth more than twenty shillings.

I think the illustration I am about to give shows the real nature of money and its representative character. When Captain Franklin was approaching the Arctic Sea, he dismissed

his Indian guides, and, to their great surprise, offered them a piece of paper. Were they, after their fatigues and exertions, to be remunerated by a piece of paper? Captain Franklin explained to them, that this piece of paper was an order on the government stores at Montreal for a liberal remuneration in the shape of muskets, gunpowder, and blankets. The Indians, having faith in Captain Franklin, took his paper order, which became to them what a bill of lading is to a banker, or a warehouse order to an advancing broker, or a penny postage stamp to a man about to write a letter, or a ship note to a sailor. Now, if all other Indians had the same faith with whom they came in contact, this paper would have become money. Then why should not England, a civilized country, have faith in her government, and allow it to issue paper money? I maintain that the first function of a government is to find its people in an instrument of exchange. Taxation implies such a power and such a function.

* "Pop. Cyclopædia;" Article, *Britain*.

If government refuses, as all governments refuse in the present day, to take taxation in kind, but demands money, then that government ought to make a money, and not compel its people, as our government does, to go to the ends of the earth to dig for a yellow ore, which ten years since could not be found, but now may be found in such quantities as to disturb all social relations, upon a plea, and a false plea, that when this nation contracted a debt of £800,000,000, it contracted a debt of 8,000 tons of gold—more than exists on the face of the globe—which the nation must pay down, or else an annual interest of 300 tons.

The consequences of such an absurd money are very disastrous. A man has an income of £10,000 a year; he lives on, say, £1,000 a year, and has the difference, £9,000, to dispose of. What is he to do? If he wishes to be quite safe, he must do as the orientals do; must hoard and bury it. But let him take it to a bank, in the foolish belief that the bank puts it by safe in boxes for him to have whenever he may choose to call. For a few years he goes on imagining that the bank has in its coffers some £30,000 in gold. But a cloud gathers in the political horizon; the commercial world becomes distrustful, the bank puts the screw on—that is, raises discounts; that is, cheapens commodities; that is, enhances money. A panic begins; it spreads; our friend runs to the bank for his deposit, but finds his fellow-depositors have been before him; the bank stops payment, and his fancied wealth, or rather gold, is—nowhere! And this happens every four years. His savings have accumulated, but the gold which ought to increase with them, or represent them, does not increase. With paper money he might accumulate with safety, for, as his savings increased, paper money would increase, and panics, or runs for gold, would be impossible, for gold would not be a money, and if people ran for paper, they would get it, provided it was owing to them.

I could write a thick volume to illustrate the insanity of our present system; but if I am asked for a better, my answer is, I am not prepared to give a better; but let the nation take this question up, and attend to it before any other, for this emigration to Australia indicates what I am attempting to show, viz., that what the country is thirsting for is, more money.

What is wealth? Is it not raw material moulded and fashioned by labour? Raw material being, then, inexhaustible; labour more efficient, with the assistance of machinery, than ever was known; and man's desires being boundless—for I suppose every man wishes for more various food, for a more commodious house, for more elegant dress, and for better furniture; for more books, pictures, and flowers—what is it that ties this great industrious nation of England to such mean accommodations, but want of money? Then, I say, give government power to make money, and what would a little extravagance signify? What would the nation care if a few millions more a year were spent, seeing that it would give employment?

I could illustrate the fact that the want of money is the great obstacle to advance; but, as one instance, take the education of the people. Why are not the people educated? Because of the cost. Well, suppose my plan annihilates cost, is it not worth attending to? Issue education paper money; build schools; pay schoolmasters; supply apparatus; let such money circulate among the people, and let the government recognise it as legal tender for the education rate, when it might be cancelled. "He that hath ears to hear, let him hear." To the man who is in an affirmative state this is enough, but to the man who worships gold, who cannot shake off the prejudices of youth, no words can have effect, no argument satisfy. Do you want the people educated? Are there men enough to build your schools? Is there enough of slate, brick, clay, and lime? Are there enough of men competent to be schoolmasters? Is there any short supply of books, maps, and chemical apparatus or geological specimens—of Bibles, Testaments, and prayer books—of slates and pens? If not, for heaven's sake go to work, and don't let money stop you: make your money. Money is the servant of man—man should not be the slave of money. I will close by giving some queries by Bishop Berkeley, which will have more weight with your readers than anything I may say.

"Whether the four elements, and man's labour therein, be not the true source of wealth?

"Whether money be not only so far useful as it stirreth up industry, enabling men mutually to participate in the fruits of each other's labour?

"Whether money is to be considered as having an intrinsic value, or as being a commodity, a standard, or a pledge, as is variously suggested by writers? And whether the true idea of money, as such, be not altogether that of a ticket or counter?

"Whether the term livre, pound sterling, crown, &c., are not to be considered as exponents or denominations of such proportion? And whether gold, silver, or paper, are not tickets or counters for reckoning, recording, and transferring thereof?

"Whether the denominations being retained, although the bullion were gone, things might not nevertheless be rated, bought and sold, industry promoted, and a circulation of commerce maintained?

"What makes a wealthy people? Whether mines of gold and silver are capable of doing this? And whether the negroes, amidst the gold sands of Africa, are not poor and destitute?

"Whether there be any virtue in gold or silver other than as they set people to work, or create industry?

"Whether power to command the industry of others be not real wealth? And whether money be not, in truth, tickets or tokens for conveying or recording such power, and whether it be of great consequence what materials the tickets are made of?

"Whether to promote, transfer, and secure this commerce, and this property in human labour, or, in other words, this power, be not the sole means of enriching a people; and how far this may be done independently of gold and silver?

"Whether a fertile land, and the industry of its inhabitants, would not prove inexhaustible funds of real wealth, be the counters for conveying and recording thereof what you will—paper, gold, or silver?

"Whether the opinion of men, and their industry consequent thereon, be not the true wealth of Holland, and not the silver supposed to be deposited in the bank of Amsterdam?

"Whether, in order to understand the true nature of wealth and commerce, it would not be right to consider a ship's crew cast upon a desert island, and by degrees forming themselves to business and civil life, while industry begot credit, and credit moved to industry?

"Whether such men would not all set themselves to work? Whether they would

not subsist by the mutual participation of each other's industry? Whether when one man had in this way procured more than he could consume, he would not exchange his superfluities to supply his wants? Whether this must not produce credit? Whether, to facilitate these conveyances, to record and circulate this credit, they would not soon agree on certain tallies, tokens, tickets, or counters?

"Whether it be not agreed that paper hath, in many respects, the advantage above coin, as being of more despatch in payments, more easily transferred, preserved, and recovered when lost?

"Whether the sure way to supply people with tools and materials, and to set them to work, be not a free circulation of money, whether silver or paper?

"Whether the great evils attending paper money, in the British plantations of America, have not sprung from overrating their lands, and issuing paper without discretion, and from the legislators breaking their own rules in their own favour, thus sacrificing the public to their private advantage? And whether a little sense and honesty might not easily prevent all such inconveniences?

"Whether there are not to be seen in America, fair towns, wherein the people are well lodged, fed, and clothed, without a beggar in their streets, although there be not one grain of gold or silver current among them?

"Whether the use and nature of money, which all men so eagerly pursue, be yet sufficiently understood or considered by all?

"Whether a discovery of the richest gold mine that ever was in the heart of this kingdom would be a real advantage to us?

"Whether, therefore, a national bank would not be more beneficial than even a mine of gold?

"Whether counters be not referred to other things, which, so long as they keep pace and proportion with the counters, it must be owned the counters are useful; but whether beyond that, to covet or value counters be not direct folly?

"Whether we are sufficiently sensible of the peculiar security there is in having a bank, that consists of land and paper, one of which cannot be exported, and the other is in no danger of being exported?

"Whether money could ever be wanting to

the demands of industry, if we had a national bank?

"Whether paper doth not, by its stamp and signature, acquire a local value, and become

as precious and scarce as gold? And whether it be not much fitter to circulate large sums, and therefore preferable to gold?"

JAMES HARVEY.

Social Economy.

IS THE CONFESSIONAL IN HARMONY WITH INTELLECTUAL AND MORAL FREEDOM OR SOCIAL WELL-BEING?

NEGATIVE ARTICLE.—II.

It is our duty to defer the reception of a doctrine until we are fully informed respecting its various relations; hence our obligation thoroughly to examine those relations, and to refer them to some natural or supernatural standard, before we arrive at conclusions. The exercise of this discriminatory power is the native and inalienable right of every human being, having full scope in regard to all human enunciations, and extending even to divine communications. The great Governor of the universe sanctions and invites the free, unfettered exercise of human judgment in relation to himself, his dealings, and his teachings. He speaks thus:—"Come, now, and let us reason together." "The Lord hath a controversy with his people, and he will plead with Israel." "Oh, men of Judah! judge, I pray you, betwixt me and my vineyard." And, through Paul, the word is thus submitted to man's judgment: "I speak as unto wise men; judge ye what I say." Again, in regard to the treatment of that which christian teachers may enunciate, we are taught not only to receive the word gladly, but to bring it to the issue of a comparison with the word of God; for we are enjoined to go "to the law and to the testimony: if they speak not according to this word, it is because there is no light in them." And again:—"Believe not every spirit; but try the spirits, whether they be of God, for there be many false prophets." Thus the word of God is quite clear with reference to the province of human judgment, a province which no human agency can destroy, be it prophet, priest, or church.

Most ominous to the pretensions and tendencies of the Church of Rome is that word in its literal applicability, which speaks of

those who make the scriptures of none effect by their vain traditions. Rome receives that word as authentic and authoritative; but it has also traditions, and from these it gathers its many errors, and amongst others its theory of the insufficiency of the scriptures. The Church of Rome invalidates the authority of scripture, in that it denies man those rights as a reasonable and moral being which the Bible clearly assigns to him. This thing of humanity usurps the authority of the Almighty; and violates the legitimate claims of man. This priestly power sets forth all imaginable advantages as arising from connexion with its communion, and demands, as the condition of such connexion, a pledge of absolute unconditional submission. This church—in the most charitable sense ecclesiastically-human in its origin, its doctrinal and constitutional growth, determined by circumstances of worldly policy and after the manner of secular institutions—this church teaches in relation to its position that man, in his infirmities, is altogether dependent upon it, and that its claims are such that to doubt or dissent is to sin. The Church of Rome forecloses all examination of its doctrines by denying the legitimacy of private judgment; and it anticipates all further appeal to other authority by maintaining the dogma of its own infallibility.

The standard of eligibility to the priesthood furnishes no intervention between the evils of the system and the interests of humanity. That standard recognises no difference between the man carnal and the man renewed in the divine image. Men who, under some phase or other, are personally ill affected towards the mental and

moral freedom of mankind at large, have full scope and ample powers in such connexion, and even those naturally or by grace indisposed to act detrimentally to others, are, in this church, converted into active parts of a despotic agency, and tools of a thought-quelling, soul-enslaving system; their individual responsibility merges into that of the church.

To such a system—such a priesthood—we have to add the confessional. Confession, as required by the Romish Church, is the thorough laying bare of a man's inner life to the church's ken, in such manner as that all diversities from a disposition well affected towards itself shall be known and dealt with. All that in the system is hostile to the legitimate exercise of the individual mind—all the several, and may be numerous, personal predilections in the priesthood unfavourable to such exercise, and the whole priesthood as unfavourably affected by the system—all these hostilities are brought to bear intimately and directly upon the springs of principle and upon the sources of mental action. Through the confessional the priest gains knowledge of the impulses yet latent in the soul, and of crude feelings there, in such stages of their formation as that they are scarcely obvious to the man himself. The confessional offers itself to the priesthood as a means of obtaining full possession of a man's soul—of taking the rulership out of the hands of his reason—and the moral jurisdiction away from his conscience.

It seems to us impossible for persons educated in Romanism, and practising confession as the church prescribes, to form a truly rational and impartial judgment upon ecclesiastical and spiritual matters. The stipulated unreservedness of confession, the searching power vested in the priest, and the habit of unreasoning obedience to all his counsel wrought in them from infancy, places the determination of their wills at the option of the priest, and makes him, if he wills, the absolute fashioner of their mental development.

The more intimately confession is identified with the life, the earlier will the man's inner transgressions against the church be known to its emissaries; and thus the church's influence will be employed, ere reason has collected its energies, or the conscience has clearly outspoken.

In the classification of matters for confession, those which relate chiefly to the system and the class are placed highest, and in the same category as the most aggravated sins against the supreme Lawgiver. Priestcraft will also ever be more solicitous about offences against itself than transgressions against God.

The patriot Romanist detecting the latent working of aggressive tendencies in his church, or observant of more open manifestations, must, in proportion to the depth of his patriotism, feel troubled and suspicious; but these feelings are the germs of rebellion against the church, and constitute themselves serious sins. They must be confessed to the priest; and if he cannot make an enthralled conscience or a coward heart stifle the germinating crudities of the inner life, priestcraft will institute extraneous interferences. If Galileo were persecuted, would his discoveries be patronized? If Garibaldi were hunted, would his opinions be allowed to pass? If Guiccardini were imprisoned, would the study of the scriptures be recommended? If Luther were excommunicated, would church reform be petted in the Vatican, or would Lutheran doctrines be left unmolested? A suspicion that Galileo was right, according to Romanism would be a sin; a fellow feeling with Garibaldi, touching ecclesiastical reform or national freedom, would be a sin; a doubt in relation to the purity, policy, or constitution of the church in Luther's day would have been a sin; and a longing after the scriptures would now be a sin. And these all are matters for the confessional. Thus the confessional enables the church to nip in the germ the results of the soul's gathering consciousness, and finally to destroy that consciousness, and leave the soul to inanity and torpor. The confessional is, therefore, plainly at issue with mental and moral freedom, not only because it is in connexion with a system essentially and universally inimical to that freedom, but it would necessarily be so in connexion with any system which threw round its agents peculiarities to them amongst men as a separate and privileged class.

The second and distinctive aspect of the question before us involves the social influences of the confessional. The classes of interests proposed for our consideration are so mutually identical as to excuse their

juxtaposition in the question; but we are necessitated to consider this last abruptly and briefly. Everything inimical to man as a thinking and moral being must necessarily be disastrous to his social position. An unlawful interference with his mental powers must tend to retard the progress of society. Such interference also with the moral man must tend from the evangelical to the idolatrous or the atheistic. Besides these things, the confessional is, unhappily, fruitful of illustration of more direct antagonism to social welfare. It has a natural and necessary tendency to convert domestic and social intercourse into a system of mutual espionage. It engenders individual reserve, generates distrust, and originates treachery. Where is the proof of a naturalized and general treachery most to be found, but in countries where the confessional is most upheld?

The confessional tends to the aggravation of crime in general. The premeditation of crime, or its commission, is naturally and universally attended by a fear of certain indefinite consequences: this, in the most savage communities, must, in some measure, act beneficially; but men of Belial, assured by the father confessor that, at the price of a show of compunction—of a full and yet safe disclosure of their guilt—of the performance of certain frivolous or temporarily painful acts, or of the disgorgement of a portion of their spoil, they are fully and freely forgiven by Him to whom all things are naked and open, and are, therefore, safe from the punishment due to their sins—the

natural, universal barrier to crime is broken down. This evil is so manifest, and the inference so obvious, in reference to the action of the confessional upon society, that we make no further comment.

The confessional tends to the aggravation of profligacy in particular. Think of the priesthood, with its various forms of reactionary discipline—the celibate more especially; it would seem as if the whole nature of the man were studiously reined in in order for a more impetuous spring. Satan must certainly have suggested to the Romish priesthood the most unnatural forms of religiousness, as affording the readiest leaps into the diabolical, fearfully preparing them for the rebound from unnatural restraint to its opposite licentiousness. Think of the priests individually, and in the solitude and secrecy of the confessional, being the unseemly and unnatural repositories of woman's secret sins, eliciting, in accordance with their instructions, that which nature, and feminine nature especially, would solicitously conceal. A *good* man here would stand as on slippery ground; a bad man must find this the gate of hell—a very Sodom. What can possibly come of the confessional in this aspect, but a lamentable deterioration of moral sentiment, and a most fearful corruption of the virtuous element in our social fabric. The confessional must dim the fascination and destroy the life of domesticity, and degrade the moral position of woman. The confessional is at intentional issue with intellectual and moral freedom, and is at direct and deadly issue with social well-being. W. G.

AFFIRMATIVE ARTICLE.—II.

In taking up our pen to support the position of "Confessarins," we desire to view this question not as affecting the dogma of a certain creed; and, laying aside all religious dissensions, we will look at it simply by the light of reason. The higher ground of its divine origin or its scriptural authority we will leave, and confine our attention to its harmony with the moral nature of man. The confessional is an institution coinciding with a law of our nature, and any organization calculated to carry out those laws, and to preserve our moral nature from corrupting influences, must be regarded as a positive good.

First let us look at the principle of confession, before we look at it as developed into a system in the form of the confessional. "Confess your sins one to another," says the inspired writer. The individual who has committed an ill deed, or thought an ill thought, has degraded himself in his own eyes; he is deprived of so much purity; and, like a rust spot, the sin will sink and canker in his soul, unless brought out and cleansed by confession.

The man who has confessed even to his vile accomplices feels comparative ease and freedom from the load of guilt which would sink him to perdition—is lightened. A

candid confession allows a person a starting point for a new course of moral rectitude; he is "a new creature;" he has done with the past, and the future may be full of hope. Every creature must feel the necessity of occasional confession for the sake of his individual happiness; it is an outlet from which flows the generated corruptions of his nature. The man with the dark brow, shadowed by the mantling gloom of malignity, does not confess his crimes; no, he hides them in his heart, until he is saturated with his own villainy.

Again, watch the man upon his dying bed who has committed crimes and buried them within his own bosom: they torment him more than his physical sufferings; he discloses them for present relief, as much as for pardon from the avenging Providence.

Thus we see that confession is a principle of our moral nature, and, as such, it becomes our duty not to repress, but to develop it. We now come to inquire which is the best system for promoting the efficacy of confession. Some would say, let your friends and relatives be your confessors. There are many objections to this. Jealousy, rivalry, and personal ambition mix up largely in the common affairs and ordinary relationships of life. Indiscriminate confession to surrounding friends would throw the apple of discord into society; bonds would be broken, ties severed, and domestic anarchy would follow.

But the publicly-established confessional affords the desideratum. When we view the confessional as an institution of society; when we see its functionaries absorbed in the duties of their holy calling, elevated above the sordid and mercenary world, living in an atmosphere where the conflicting passions of sensuality are unknown, we are inclined to think that no institution could be more calculated to advance the moral welfare of the human family. For this reason the party who receives the confessions must possess some superior claims as a teacher and practiser of religion, although he may not be able to grant absolution. The forgiveness attends the act of confession and the feeling of repentance. The priest is the hearer; and, while the heart is opened to him and its secret thoughts exposed, he can administer the balm of consolation, mingled with gentle censure, and apply the principles and precepts of religion for its future guidance. Man is

ever prone to deviate from the paths of truth; his inner light is not sufficient to keep him from straying into the mazes of error, or we might dispense with every species of religious instruction; but, once grant the necessity of theological teaching, and what line can be drawn to exclude the confessional from assisting in the instruction of the people? The confessional does its work silently, but powerfully: it adapts itself to individual cases. Private appeals have been as effectual in the conversion of the world as the public practice of preaching. The confessional is as much in harmony with intellectual and moral freedom as any town missionary society. We do not readily imagine that the wretches which this society rescues from the pit of ignorance and vice lose any portion of their liberty by being brought into the sun-lit moral atmosphere of spiritual knowledge. No one would dream of making such a charge; but the confessional is said to be incompatible with freedom for performing the very same office.

The confessional is perfectly in harmony with intellectual and moral freedom; and, further, its tendency is to preserve both. As a great preventative of crime, it is the necessary ally to freedom. Freedom becomes aggression when it gives people a licence to act contrary to the well-being of society; and when a person has violated the laws of freedom, either by act or thought, he may go to the confessional, humiliate himself, seek for pardon, cleanse his conscience of guilt, and re-establish purity of heart. The ills which society receives from its members are not always sufficiently tangible to come within reach of the civil law; these are brought to light and condemned at the confessional: the offender is not stamped as an outlaw and then let loose an enemy to society, but he is received again to her bosom; he is forgiven, becomes a better man, and goes on his way rejoicing.

Let us now, in conclusion, sum up the claims of the confessional:—

Firstly. The confessional does not interfere with individual freedom.

Secondly. It possesses no judicial function, and, therefore, is incapable of tampering with public liberty.

Thirdly. The confessional stands like a mighty champion of morality, checking those under-currents of licentiousness and sedition,

and thus tends to preserve the peace of the world.

Fourthly. The confessional is a sort of quarantine for the mind, by which it is purified from pestiferous contact with the world of sin.

Fifthly. We may regard the confessional as a sort of faculty of moral physicians. The bodily advisers have studied the researches of science and the laws of nature; we trust to their guidance. The spiritual advisers have studied the nature of the soul, and know how to apply the truth to heal her diseases; but without confession the efforts

of either would be futile, and it is as necessary a part of one system as the other. You cannot apply the remedy to an evil without first knowing it. And this is what the confessional facilitates in order to effect the removal of the weeds of vice from society, and to direct men's minds from the gross and sensual world to pure and holy objects, to infuse in them the spirit of love and devotion, to pilot them through the world (with its dangerous quicksands and rocks) to the haven where "the wicked cease from troubling, and where the weary are at rest."

EUROPEAN PHILOSOPHY.

BY THE AUTHOR OF "THE ART OF REASONING."

PROLOGOMENA—(*Concluded.*)

In composing a History of Human Thought, it is of great importance to notice and signalize the direct filiation of Ideas. Truth is not self-generative, but produced. To trace the genealogy of thought—the antecedents and subsequents of each idea—is one of the great duties of a historian of Philosophy. The parentage may not, at first sight, be obvious; but the historian's researches will enable him to present a *cumulation* of evidence which leads him to believe in the mutual connexion of thought with thought. Hence it arises that, in presenting an outline of the course to be pursued in the present series of selections, we shall be compelled to introduce, *in limine*, a sketch of that Philosophy which took its rise in those orient regions where man most early put forth the blossomry of thought.

The Introduction will treat of a period which recedes into the far distance of Antiquity, and which is but faintly discernible through the long vista of five thousand years. Our pilgrimage will be in "The Lands of the East"—Persia, Egypt, India, Chaldea, China, Palestine. There Philosophy, like the waters of the Nile, flows from sources, some of which are yet undiscovered, and merges into the vast ocean of human intelligence.

To this period belongs the Evangel-Philosophy contained in the works of the God-taught Moses—in the polity and religion of "The Children of Israel"—in the sayings of Wisdom's most richly-endowed son, Solomon—in the mildly-persuasive though sternly-reproving words of Isaiah—in the plaintive wailings of the woe-worn Jeremiah—the thunder-threatenings of Ezekiel—and those other "voices of the Lord," the minor prophets.

In the Celestial Empire Confucius and Meugius will appear to us, and give forth the great thoughts which came to them of Duty, Obedience, Honesty, Love, and Worship.

They will arise and teach us the value of forms, and the necessity of rituals, to express "the Ideas of the Reason."

A glimpse of the Chaldaic life-oracles, derived from the study of "the stars," which they made not only "the poetry," but also the philosophy, "of Heaven."

Then we shall change our point of vision, and the thought-science of Hindustan will meet our view. Here we have Deity symbolically represented as Brahm—pure Intelligence, or Om—glorific Light; and the grand desire of human souls should be towards Eeswar—the divine light-beams which Om evolves and circulates throughout the universe for the nourishment of the soul.

Mysterious Egypt—dawn-world of great thoughts embodied in great works—will invite us to inspect the inscriptions on her monuments, statues, temples, pyramids, and tombs—now almost outworn by the constant tread of ever-travelling Time—to see if we can there learn aught of her solution of the great queries relating to human destiny.

The Persian will then present his Zendavesta—a vast mythic symbolization of the Omnipresent and the Holy. He will tell us of Ormuzd—Light, Creation, and Unity—the fountain of Good, as well as of that fell opponent-power, Ahriman—Darkness, Destruction, and Disunion.

In all the speculations of this era one great fact will arise, viz., the *identicalization* of Philosophy and Religion. The human soul, stirred by "the problems of the Reason," constructs for itself, or accepts as an answer, a Religion. A class is then set aside to perform those sacrificial and propitiatory rites which such a Religion necessitates. Thus Philosophy becomes venerable in the eyes of the people, too sacred for vulgarians. The degeneracy of learning in all but one exclusive caste, and the gradual attainment of an hereditary monopoly of the treasure-stores of wisdom by the priest-rulers, are the more prominent results of this coalition or identicalization.

This view of pre-European Philosophy will lead to the proper topic of this series of papers, which shall be considered in three great divisions, viz.:—

I. Greek Philosophy.—1st. Pre-Socratic; 2nd. Socratic; 3rd. Post-Socratic.

II. Mediæval Philosophy.—1st. Subordination of Philosophy to Theology; 2nd. Alliance of Philosophy and Theology; 3rd. Differentiation and Divorce of Philosophy and Theology.

III. Modern Philosophy.—1st. Sensationalism; 2nd. Idealism; 3rd. Scepticism; 4th. Mysticism; 5th. Eclecticism.

To indicate the general tendency of such a series of papers is exceedingly difficult, because—1st. So wide a range of thought is not easily held at one glance before the mind; 2nd. The necessary concentration of remark is likely to produce that sort of ambiguity which results from too great brevity; 3rd. The great landmarks only can be noticed, and hence an apparent disconnectedness of thought results; 4th. We must presume a certain degree of knowledge in the reader which he may not possess; which, if he has, he wants not to receive from us, and if he has not, cannot acquire, so that either way we risk becoming tedious and tiresome; 5th. An aptitude of filling up the outline-thoughts presented must be presupposed; and, 6th. The unsatisfactoriness of a mere "bird's-eye view" of the landscape of human thought may deter the reader from pursuing his inquiries further. Still, when we consider how much we shall gain by the establishment of confidence between ourselves and our readers, we are inclined to set these difficulties at nought and hazard the attempt.

Should we fail, perhaps the reader will remember that the magnitude of the topic presented almost insurmountable obstacles to the accomplishment of our design—it is not easy to write a copy of the “Iliad” which may lie in a walnut-shell; while at the same time he may reflect that there may be deficiencies in the reader as well as in the author.

I. Greek Philosophy.—This division introduces us to a land where thought was free as the waves which encircle its glory-haloed shores—the land of the enfranchisement of mind—of wisdom-worship—where appeared those thought-kings whose shades still “rule our spirits from their urns.” Of the earlier period of philosophic thought we have but little record. At first ideas would arise spontaneously in the mind unsystematic and unscientifically trained; like bright flashes of intuition, they would course along “the hemisphere of thought,” beautiful and interesting from their novelty and sublimity. Hence Philosophy and Poetry became wedded friends, and the earlier sages were not only philosophers, but poets. Ever it is thus, the grand mysterious sublimities of mind educe poetic skill, and the dawn-thoughts of the wise are embellished by the gifts of the Muses. Through the strange though beautiful cloud-haze of myth which shadows man’s earlier history, there is enough seen to convince us of the fact that the curiosity of the human mind was early awakened to cosmogonic and metaphysic speculations. Among the earliest thinkers Orpheus—perhaps a mere myth representative of the sacerdotal race who thus early ruled in Greece—arose, and by his religious hymns and poems commenced that deep thinking on God, creation, destiny, &c., for which Greece has been so famed. Musæus followed, and led the thoughts of men to the dwelling-place of the dead. Homer and Hesiod individualized and named the various sub-forces of nature as minor gods; and other lyric and gnomic poets, by their hymns, odes, &c., contributed, if not to the elaboration of a philosophy, at least to a mythology in which the seeds of much philosophic thought lay embalmed.

Next came a contest of minds, a revolt against blind faith, an attempt to elaborate a practical wisdom—a wisdom which should guide in legislation, life, and warfare. Sacerdocy, opposed by sternly practical minds, who saw no hope for man so long as he was a blind follower of creeds and performer of ceremonies, if these were uninformed with higher meanings bearing on man’s moral wants, fell; and the Heptad—the seven wise men of Greece—appeared, and gave utterance to their lore. Political prudence, acute observation, much knowledge of the human heart, a keen sense of freedom, seem to have been the predominating qualities of their minds; and the pearl-strings of sayings, marked by sagacity, conciseness, and that epigrammatic terseness which impresses the mind at once, which they left, though delivered without any signs of philosophical elaboration, are the germs of much subsequent speculative thought.

Contemporaneously the Ionic and Italic schools of Philosophy appear on the historic *stage*, with Thales and Pythagoras respectively occupying the foreground. Subsequently the Eleatics, with Xenophanes of Colophon, Parmenides, and Zeno—the originator of “The Science of Reasoning”—as the chief teacher, present themselves. The Cosmogonists—those to whom the universe seems a mystery, and their own being “the mystery of mysteries,” and whose inquiries, therefore, relate to the Origin of the Universe and the Soul of Man, the chiefs of whose school are Heraclitus, Democritus, Empedocles, and Anaxagoras—call for our attention.

Then there arises a new sect, who deny that knowledge is attainable by humanity, the Sophists, men who professed to teach the true method of thought, speech, and action—men who by their verbiage, by cloudiness of phrase, sought to conceal their ignorance and ape wisdom—men who by word-jugglery contrived to maintain the semblance of knowledge.

But who is that man of curious gait who walks about the forum? From his hearty laugh one would suppose him a humourist. His flattened snub-nose, his thick, protruding lips, his projecting eyeballs, his short, squat figure, his somewhat unwieldy portliness of person, and his general awkwardness, combined with the evident shabbiness of his dress point him out as one who, in the ordinary course of things, can only be the sport of the gay “wise men” who surround him. But, no! See! he is listened to with deference and respect, and ever and anon a loud laugh seems as if it hailed with pleasure the discomfiture of some one or more of those professors of wisdom, who are seemingly obliged to confess themselves baffled or mistaken by that poor, unfashionable, inelegant personage whose parents, we understand, occupy the humbler walks of life. That is Socrates—name which can only be forgotten when the stars sickle and die. We shall introduce you to him at a future time.

The several Socratic schools are now originated—the Megaric, with Euclid for its head—the Cyrenaic, with Aristippus as its chief teacher—the Cynic, with Antisthenes and Diogenes as its chief representatives.

Afterwards appeared the broad-browed, meditative Plato—perhaps the greatest, the most widely-discursive genius of ancient times. High-souled and gifted, brilliant and wise, his works are a mine of wisdom, richer and more precious far than the gold treasure which Australia or California conceals in its bosom—the riches of a spirit revealing its struggles in that great truth-search in which all good men in all ages have delighted to engage. To him succeeds the mighty Stagyræite—that cool, clear, formal, acute, and daring thinker—that giant amidst a race of giants. Eager, impetuous, deep-thoughted and truth-loving—extensively learned, laboriously studious, enthusiastically enamoured of speculation; he has become one of the mightiest names which the glorious land of Greece can boast. We hesitate not to say that to him we are indebted, indirectly, for many of the blessings of the Reformation. How, we shall show anon.

Stoicism took its rise from Zeno of Citium; then Epicurus of Samos produced his much misunderstood doctrine. Afterwards Philosophy withdrew from Greece, and erected her chief seats in Alexandria and Rome. Why? Macedonian ambition, aided by the general declension in morality, had snatched at Greek liberty and gained it; and with the loss of liberty, Arts, Science, Civilization, Intellectuality, Philosophy, fled “the desecrated shores.” Rome, it is true, had a few on whom the mantle of the Greek masters had fallen, and Alexandria was busy with thought-traffickers.

Christianity—“the day-spring from on high”—descends, and the destinies of the earth are changed.

Gnosticism and Greco-Christian speculations now occupy many minds. The Theological Philosophy of the Fathers of the Church becomes considerably dominant. But another day dawned. Rome, sated with conquest, swollen with pride, enslaved by luxury, infatuated by success, became a mass of, almost unleavened, moral putrefaction. Pass-

was no longer subordinate to Reason; and while she held the reins of the whole world, she permitted her own appetites to run riot, unswayed and unchecked. The foe approached. Paralysis unnerved the arm of Rome. Resistance was vain. The crown was snatched from the laurelled brows of the world's mighty mistress. Gloom and darkness settled upon the intellectual horizon of Europe.

II. Mediæval Philosophy.—A scene of dismal blankness, scantily illumined by the radiance of genius, is all that History can here present us. Corruption had entered the Church. The world and its honours became the possession of the reputed successors of him who said, "My kingdom is not of this world." A pseudo-infallible church having seized the reins of power as they were stricken from the nerveless arm of Rome, promulgated her edicts against the culture of the Intellect. Religion, by her interpreted, was to be man's "all in all." Boethius, Averroes, Alcuinus, Scotus Erigena, &c., belong to this era. The purpose of the Church, however, could not be accomplished. The mind cannot rest in unspeculative contentment and inactive torpidity—it *must* reason. Then she strove to combine the philosophic doctrines of the ancient world with the infallible doctrines which she promulgated. But she defeated her own end, and prevented the possibility of having an hereditary monopoly of all knowledge within her own pale, by the law of clerical celibacy. Then was the reign of Scholasticism consummated. Disputations, logic, mistaken subtlety, ingenious quibbling, inane debate, word-jugglery—anything, in fact, was hailed with "*benedicite*" which could occupy the mind on any other topic except the investigation of the credentials of that spiritual tyranny which sat on the throne of the world, bore the tiara of a *duplex* dominion, and stretched an iron sceptre over a prostrate and benighted universe. St. Anselm, Roscelinus, William of Champeaux, Abelard, Peter Lombard, John of Salisbury, Amaury, Bonaventura, and Thomas Aquinas, were the chief illustrious names connected with philosophic pursuits which appear in this era.

But this very Logic, which was employed as a mere instrument of wrangling, contained within it the seeds of greater things—it led the mind to inquire into the origin of knowledge, the rules of evidence, the *criteria* of truth, &c. It found the solution of these points by the Church unsatisfactory, while its practice militated against the laws which were found to regulate the development of human thought. The Church, however, had so far incorporated the Logic of Aristotle with its other would-be infallible decisions, that, when doubts of the utility of such studies entered the mind, men were punished as heretics, and thus the initiatory steps were taken which eventually resulted in that mighty, that unparalleled movement, in which all dominion, merely human, over human reason, was contemptuously renounced. The Church having been found fallible in one point, the idea of infallibility began to wane, and the mind, having loosed some of its fetters, was too happy in liberty not to attempt greater revolts. Roger Bacon, Duus Scotus, Raymond Lully, William Occam, John Charlier de Gerson, Manettus, Lodovicus Vives, and that "bold and persevering spirit," Peter Ramus, arise in our memory as worthy of notice.

III. Modern Philosophy.—Printing has been invented—the New World is discovered by Columbus—the passage by sea to India is found—"Mene, mene, tekel, upharsin" is ominously written on the walls of the Church of the Seven Hills. Great things are stirring to their birth—mind is in a ferment—unwonted activity animates thought. The

indomitable spirit of Luther burst asunder the fetters of the all-potent Church like stubble-withes. Then rushed that flood-tide of passion across the mind of man which made resistance to this monstrous soul-tyranny a virtue. They resisted; and "they stood free"—free, but not "alone," for by their side, "that they might not be moved," was God. Then the philosophy of Bacon dawned upon the world, teaching men that they were "the servants and interpreters of Nature, and could only act and understand so far as they observed and studied the order of Nature." Descartes wrought out the criteria of metaphysical truth, and the *formulae* of philosophic thought. Arts, Science, Civilization, Freedom, Religion, grew and flourished. In rapid order arose the various philosophies of mind and matter; and the names, amongst others, of Hobbes, Spinoza, Locke, Gassendi, Leibnitz, Berkeley, Hume, Condillac, Kant, Reid, Fichte, Schelling, Stewart, Jacobi, Schlegel, Hegel, Brown, Coleridge, Cousin, Schulze, Sir William Hamilton, Comte, &c., were in rapid succession written in characters of light upon the page of Fame.

In an appendix we shall endeavour to condense an account of philosophic thought in America. As the tendencies of Philosophy there are the direct results of "European Philosophy," we apprehend that this will be found a fitting sequel. The names of Edwards, Schmucker, Upham, Tappan, Rauch, Hickok, &c., will grace this page, while a general abstract of the progress of Philosophy in modern times, and an estimate of the tendencies of Thought, will form an appropriate conclusion.

The foregoing abstract may rather be considered as a running table of contents than as an appreciation or signalization of the phases of philosophic thought: as such we hope our readers will receive it with indulgence. The ideal outline, rude and imperfect as it is, is now before you. May we be able to fill it up fittingly!

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

120. Can I beg of you to give me a short account of the origin and nature of manors? What is enacted by the statute, *Quia emptores*? Why must all manors, existing at the present day, have existed before that statute was passed? An answer inserted in the *British Controversialist* would be esteemed a very great favour by—**INQUIRER.**

121. I wish to enter the Church of England as a minister; but being possessed of a limited income, I take the liberty of inquiring, through the medium of your journal, the best and least expensive method of so doing, the probable cost, and the examination (if any) that has to be passed previous to entering college.—**A SUBSCRIBER.**

122. I should esteem it a great favour if any of your experienced correspondents could inform me—

1. Of the conditions and intellectual attainments required of a young man before he can enter a Dissenting college to be trained for the ministry.

2. The plan of studies pursued from beginning to end of such college course, or of any "manual," giving the information I seek—"EARNEST."

123. Being about to have my name entered on

the boards of one of the colleges at Cambridge, some of my friends advise me to study for honours; others tell me that, as I have no aptitude for mathematics, I had better not attempt that, but study, as they call it, for an ordinary degree. Now I should like much to know, if any of your readers could inform me, what is the difference between the two courses of study, and what, if any, are the peculiar advantages of pursuing each respectively; advantages, I mean, to be gained thereby after one has left college.

Any other information respecting Cambridge University will oblige.—**S. E. E.**

ANSWERS TO QUESTIONS.

101. *The Study of Language.*—The plan wished to be adopted by "Avarus" is one that I cannot recommend. The maxim, "He who hunts two hares leaves one and loses the other," will, I think, apply in this instance. The study of any language requires great attention, and an undivided energy should be directed to it; and, if it is wished to unite with it any other study, then the thoughts are distracted and the energies divided, and not only will there be no saving of time, but also

neither study will be so successfully pursued as if each had received a separate and undivided attention.—D. H.

113. *How to keep a Diary.*—The term "diary" (derived from *dies*, the Latin for *day*) signifies a daily record, or account of every day's transactions. Those who desire to keep one, but have hitherto not made the attempt, will find the following hints of service; the peculiar circumstances of some persons may, however, render modifications and additions necessary:—

1. A diary should contain an account of every day's transactions, for events apparently insignificant at the time may materially affect the course of our after-life, and a day in which absolutely nothing has been done is not one of the least important in the view of those who have regard to their moral progress. Consequently, a book to contain such an account should be large, in proportion to the amount of time and pains we can daily devote to it, and should be strongly bound, as it is intended to be kept long—to be a life-book. It should be ruled, but not ready-dated, as most of the prepared diaries are; for on some days there will be, probably, little to record, while others will be full, perhaps, of striking and important events, requiring much longer notice.

2. It should be as legibly written as possible, in a round, easy, attorney-like hand.

3. It should be perfectly faithful in every respect. There is no need of dwelling on this point, as I presume no person writes a diary for the inspection of others, or to acquire a posthumous reputation (of which vanity we have an example, perhaps, in "Caesar's Commentaries"), but as a means of moral and intellectual progress.

4. It should contain an account of all transactions with other men, of current prices of articles of food and clothing, of travels and places visited, of new relations entered into—of all, in short, of which it may be important to remember the dates and circumstances; also with those who keep no regular accounts of income and expenditure, of bills paid and moneys received.

5. It should contain a faithful relation of all our offences, of omission and commission, against God and against man, against the law of conscience and against the law of the land, of secret faults as well as of open sins. This is absolutely necessary if we would have our diaries faithful records of our moral condition, and the only way in which we can render them effectual means of moral progress. For the same end those who wish to keep complete diaries should record all yearnings after improvement, and new resolutions of amendment formed.

6. Books read should be noticed, and their contents reviewed, briefly or at length, according to the impression they may have produced on our characters, and the time and attention we have bestowed on them. Such review, however, should only be attempted by those who have full leisure time for it, and then only when the particular book has been carefully read and reviewed *mentally*, before committing one's thoughts of it to paper.

7. In our observations upon the character and conduct of others we should be especially careful to remember the golden rule of charity, "Think no evil one of another."

8. Intellectual or moral progress which we have made, or think we have made, should from time to time be recorded.

These rules, if conscientiously followed, will, I believe, in a few years produce ample fruits in increased diligence and attention to every-day business, in a contented spirit, and in enlightened views of moral and intellectual responsibility.—NON NOBIS SOLUM.

115. *An Herbarium.*—The method of forming an herbarium is very simple. R. F. will, of course, take his "Manual of Botany" as a guide, and arrange his specimens according to the order as there laid down. The plants he wishes to preserve should be gathered in fine weather, and submitted to the following process of drying:—Place each plant between several sheets of blotting-paper, and iron it with a smooth heater, pretty strongly warmed, till all the moisture is dissipated, which will have a tendency to fix the colours. In compound flowers, and those of a stubborn and solid form, some art is required in cutting away the under part, so as to obtain a view of the profile and form of the flowers; this is especially necessary when the method is adopted of fixing the flowers and fructification to the paper previous to ironing. R. F. must always be careful to keep his herbarium in a dry place.—L. S.

I am myself no botanist, and cannot therefore give the result of any practical experience of my own, on the method of preserving plants. However, in the "Popular Educator" there is an article on the subject, from which I shall take a few extracts, and pen them in as *small a compass as possible*. The plants should be collected in dry weather, and should on no account be placed in water after being gathered. You will require a number of sheets of red blotting paper, and a small press of some kind or other. Lay the plant you wish to preserve on two or three sheets of blotting paper, previously heated at the fire till they become as hot as they can be made without scorching: arrange the leaves naturally, pressing down any stubborn stalks, and disposing the flowers with the greatest care. When the plant is arranged, lay over it half a dozen sheets of blotting paper; then insert another plant, and so proceed with successive layers. Put them in the press, and screw it up. After about three days the plant should be taken out, and fresh paper substituted, and the damp paper dried for further use. The specimens, if not very fleshy or robust, will be dried in the course of a week, or even less time. The quicker the process used for drying, the more will the colour be retained. Small specimens may be dried in a book, warmed by the heat of the pocket.

The article from which the above is extracted gives much fuller directions than space will permit me to do here. It also furnishes instruction for arranging the plants when dried: and I would therefore recommend R. F. to purchase the 17th number of the "Popular Educator."—D. H.

116. *Laughing Gas.*—Nitrous oxide, or "laughing gas," is composed of an equal number of equivalents of nitrogen and oxygen (fourteen parts nitrogen, eight parts oxygen). It is easily made, by subjecting thoroughly dry nitrate of ammonia, in fine powder, to a degree of heat equal to 275° Fahr. A flask should be employed to contain the salt, having a bent tube for the conveyance of the gas into a pneumatic trough. Below 275° sublimation occurs, which, if suffered to proceed, soon causes a stoppage in the inner aperture of the tube, and thus, preventing egress, occasions a fracture of the flask. If, on the other hand, the

heat be superior, nitric oxide is also evolved, a gas extremely deleterious to the lungs. This, however, may be detected by dissolving a small quantity of sulphate of iron (the common green vitriol) in the water of the trough, thus forming a solution capable of showing the presence of nitric oxide, by changing from an almost colourless liquid to a blackish one. The proper degree of heat, therefore, can be easily obtained.

The gas thus generated is collected in a receiver over the pneumatic trough; it is devoid of colour, taste, and smell, and possesses a density somewhat greater than common air.

"Laughing gas" is respirable, but unfitted to support life. Its effects vary as the temperament of persons inhaling it. Some few it is incapable of affecting; but for the most part the sensations produced by it are pleasurable. Sir Humphrey Davy, in 1799, was the first chemist who accurately investigated it. We subjoin, as a fair description of its effect, that of Davy. He writes:—"Having previously closed my nostrils, and exhausted my lungs, I breathed four quarts of nitrous oxide from and into a silk bag. The first feelings were similar to those produced in the last experiment (giddiness), but in less than half a minute, the respiration being continued, they diminished gradually, and were succeeded by a sensation analogous to gentle pressure on all the muscles, attended by a highly pleasurable thrilling, particularly in the chest and the extremities. The objects around me became dazzling, and my hearing more acute. Towards the last inspiration the thrilling increased, the sense of muscular power became greater, and at last an irresistible propensity to action was indulged in. I recollect but indistinctly what followed. I know that my motions were various and violent.

"These effects very soon ceased after respiration. In ten minutes I had recovered my natural state of mind. The thrilling in the extremities continued longer than the other sensations.

"This gas has been breathed by a very great number of persons, and almost every one has observed the same things. On some few, indeed, it has no effect whatever, and on others the effects are always painful."—C. J. H.

Laughing gas (chemically termed nitrous oxide) is a combination of nitrogen and oxygen. Its composition, *according to atom*, is 1 of nitrogen and 1 of oxygen; *according to volume*, 1 of nitrogen and $\frac{1}{2}$ of oxygen; its equivalent or atomic weight being 22. There is a great difference between the chemical and philosophical atom; the latter is the supposed ultimate molecule which is incapable of division, the shape of which being (according to the great majority of philosophers) spherical, the interspaces being filled up with what is termed *luminiferous aether*, or the bearer of light; the former (chemical atom) being the *smallest quantity* with which one substance will COMBINE with another. The standard by which we reckon the chemical atom is hydrogen, which, being the lightest, is taken as ONE. On the continent oxygen is taken as the standard, which is A HUNDRED. The atomic number is reckoned from hydrogen, and is consequently relative; for instance, the atomic weight of oxygen is 8, i. e., the least proportion of oxygen required to combine with another substance is *eight times* as much as hydrogen, and of nitrogen *fourteen times* as much;

therefore the atomic weight of nitrogen is 14. The formula for laughing gas would be as follows:—

1 atom of nitrogen 14, which is its atomic weight
1 atom of oxygen 8, ditto ditto

—
22 the atomic weight of laughing gas.

This laughing gas, or nitrous oxide, is obtained from nitrate of ammonia. Nitrate of ammonia is composed of nitric acid and ammonia; the former consists of

1 atom of nitrogen, 14; and

5 ditto of oxygen, 40;

the latter, of 1 atom of hydrogen, 1; and

3 ditto of hydrogen, 3

—
The atomic weight of ammonia is 17.

It is prepared by heating the nitrate of ammonia in a Florence flask; when this salt decomposes 3 atoms of oxygen from the nitric acid unite with 3 atoms of hydrogen from the ammonia, and form 3 atoms of water. The remaining 2 atoms of oxygen from the nitric acid unite with the 1 atom of nitrogen from the ammonia, and the 1 atom remaining from the nitric acid, forming 2 of nitrogen and 2 of oxygen, which, together combined form 2 atoms of laughing gas, which pass over.

The gas is colourless and heavy, it is slightly absorbed by water, and has a sweetish taste. It supports respiration and combustion, on account of the oxygen it contains.

Before respired, it should be carefully washed with water, in order to free it from any nitrous acid which might be mixed with it. When inhaled, it is a very powerful stimulant, as is well known. Although numbers have taken it without any apparent injurious effect, yet I believe, even in the healthy, it acts prejudicially (however slightly) on the constitution. In many morbid conditions, as organic disease of the heart, disease of lungs, tendency to apoplexy, &c., it would be most decidedly detrimental, and the ill effects produced, most likely, would be of a very serious nature, and might prove fatal.—A. S.

119. *Incubation*.—Strictly speaking, a chick is neither hatched from the white nor the yolk of an egg, but from a little semi-opaque spot about an eighth of an inch in diameter, termed the *cellular*, or germ-spot, and which may be detected on the surface of the yolk-bag of a fresh egg. This, during incubation, extends itself into the *germinal membrane*, which gradually spreads over and encloses the yolk, and on the central portion of which the embryo is developed. Further information is required by P. C. C., he would do well to consult "Carpenter's Principles of General and Comparative Physiology."—A. C.

The chemistry of life is certainly one of the most deeply interesting, yet subtle subjects to which the inquiring mind can be directed. To affirm dogmatically that the godlike principle of the life-giving quality, is inherent in the yolk or white of an egg, exclusively, would be saying more than the lynx eye of the most accomplished chemist can discover. Nay, in the eye of a chemist, the yolk and the white are the same, viz. albumen; the difference of colour arising from the presence of a little yellow oil. But what is albumen? A glairy fluid, the chief property of which is its coagulability by the action of heat; but a fluid in which motion and life elude

everest scrutiny. Liebig on this subject (if my memory serves me) makes no mention of the yolk; and his remarks upon the white are so very general, that they could scarcely be made to bear on the point at issue. But there is a passage in a lecture by Thomas Turner, Esq., F.L.S.,

which may satisfy P. C. C.; it is, "If these parts (the yolk and the white) are examined chemically—for they are not the germ, the germ is in connection with the yolk; . . . the egg contains what is necessary for the developing bird during its habitat in the shell."—H. C.

The Young Student and Writer's Assistant.

GRAMMAR CLASS.

Exercises in Grammar.—No. VIII.

1. Write out the following sentences, and underline the adjectives:—

Old men are not always wise. A soft answer turneth away wrath. Have no dealings with an angry man. Foolish conversation should be avoided. Sin is hurtful to the soul. Some have the art to make the worse appear the better reason. The most severe strokes of Providence

are generally healed by time. This man is wiser than his brother. The most faithful dealing and the purest motives are often misunderstood. The liberal devise generous things. The peacemaker is blessed in his deeds. The meek shall inherit the earth. Light is sown for the righteous.

2. Make a form like the one given, and place the positive, comparative, and superlative forms of the adjectives in the preceding exercise in their proper columns:—

ADJECTIVES.

Positive.	Comparative.	Superlative.
Old.	Older, or elder.	Oldest, or eldest.

3. Underline the proper adjectives in the following sentences:—

The English were sufficiently foolish to interfere with the French Revolution. The Scotch Gays were very valiant at Waterloo. The Swiss people contended many years for liberty. Scriptural knowledge is most valuable. The Welsh regard their language as the most beautiful spoken. The Bourbon family has been most unfortunate.

4. Make sentences, using each pair of the following adjectives—first, in the positive; secondly, in the comparative; and, thirdly, in the superlative forms:—

Wise, merciful; good, honourable; honest, brave; industrious, late; poor, respectable; rich, luxurious; chaste, sentimental.

Examples:—1. That man is both wise and merciful. 2. That man is wiser, and at the same time more merciful, than his neighbour. 3. That man is the wisest and most merciful man I know.

LOGIC CLASS.

Exercises on the Art of Reasoning.—No. XIX.

1. What is Method, and of how many parts does it consist?

2. Mention some of the pre-requisites of Knowledge.

3. Describe the true Method of Science.

4. Mention some of the defects of the Baconian Philosophy.

5. Give a concise outline of the Methodology of Descartes.

6. Give a concise outline of Comte's "Philosophie Positive."

7. What are the rules by which methodical inquiries ought to be conducted?

MATHEMATICAL CLASS.

SOLUTIONS.—VII.

Arithmetic and Algebra.

Question 24. Let x = hours between the times of starting and meeting of the trains; then the train A will travel the whole distance in $x + 9$ hours, and the train B in $x + 5$ hours. If the whole distance in miles be represented by d , A

travels at the rate of $\frac{d}{x+9}$ miles per hour, and B

travels $\frac{d}{x+5}$ miles per hour; therefore, when

they meet, A has travelled $x \cdot \frac{d}{x+9}$ miles, and B has travelled $x \cdot \frac{d}{x+5}$ miles; but these two distances make up the whole distance:—

$$\therefore x \cdot \frac{d}{x+9} + x \cdot \frac{d}{x+5} = d.$$

Expunging d from this equation, and multiplying out, we get—

$$x^2 + 5x + x^2 + 9x = x^2 + 14x + 45.$$

$$\therefore x^2 = 45$$

$$x = \sqrt{45} = 6.708204 \text{ hours.}$$

\therefore Train A was 15.708204, or 15 hours, 42 minutes, 29.5 seconds; and train B was 11.708204, or 11 hours, 42 minutes, 29.5 seconds upon the road.—Ans.

We see from this solution that, in a question of this kind, the distance between the places is not required to be known; and the reduction of the above equation shows us that, in all similar questions, x will be equal to the square root of the product of the two given numbers of hours, or is a mean proportional between them. C. D. S.

Question 25. Let x = the number of sheep; then $\frac{630}{x}$ = the price of each; but, if $x-3$ = the number bought, then $\frac{630}{x-3}$ would be the price of each, which, according to the question, is 5s. more than the cost price.

Therefore, $\frac{630}{x-3} - \frac{630}{x} = 5$; dividing by 5, and clearing fractions, $126x - 126x + 378 = x^2 - 3x$; completing a square, $x^2 - 3x + \frac{9}{4} = \frac{1521}{4}$;

extracting the root $x - \frac{3}{2} = \frac{39}{2}$.

$\therefore x = 21$.—Ans.

J. S. D.

Question 26. Here, when the hour hand is at 5, the minute hand is at 12.

Let x = the number of minutes the hour hand is past 5.

Now, the minute hand goes twelve times as fast as the hour hand.

$\therefore 12x$ = the number of minutes the minute hand has gone over. But the minute hand has gone over 25 more minutes than the hour hand.

$\therefore 12x - x = 25 \therefore x = 2\frac{1}{11}$ minutes.

\therefore Time = $25 + 2\frac{1}{11} = 27\frac{1}{11}$ past 5.—Ans. F. D.

Question 27.

Since $x^2 - y^2 = x + y \times x - y$

$$= 24 + x - y \therefore 24(x - y) = 96$$

$$\text{and } x - y = 4$$

$$\text{but } x + y = 24$$

$$\therefore, \text{ by addition, } 2x = 28$$

$$\text{and } x = 14$$

$$\text{and by subtraction, } 2y = 20, \text{ and } y = 10.$$

J. C. M. C.

Geometry.

Question 12. Let D be diameter of the larger circle, and d the diameter of the smaller; then $D^2 \times .7854$ = area of the larger, and $d^2 \times .7854$ = area of the smaller circle. $\therefore D^2 \times .7854 - d^2 \times .7854 = (D^2 - d^2) \times .7854 = (D + d)(D - d) \times .7854$ (1), substituting this value in (1).

$$(260 + 180)(260 - 180) \times .7854 = 440 \times 80 \times .7854 = 27646.08 = \text{area of moat.}$$

J. J.

Question 13. The diameter of the sphere must be equal to the side of the cube, i. e., 4.5 feet. \therefore The superficial content of the sphere is = $4.5^2 \times 3.1416 = 63.6174$ sq. ft., and solid content = $4.5^3 \times .5236 = 47.71305$ cubic feet.

L. R.

Mechanics.

Question 12.

$$\text{Total resistance} = 8 \times 50 + \frac{40^2}{10} \times 33 = 400 + 297 =$$

697 lb. Space moved over in one revolution of driving wheel = $6 \times 3.1416 = 18.8496$. \therefore Work performed in one revolution = $18.8496 \times 697 = 13138.1712$. As there are two cylinders, and each piston makes two strokes while the driving wheel makes one revolution. The work of 1 lb. per inch on the pistons in one revolution of the driving wheel = $1 \times 100 \times 1.5 \times 4 = 600$.

$$\therefore \text{The effective pressure on one inch of the piston} = \frac{13138.1712}{600} = 21.8969.$$

Then the resistance of the blast pipe increases in proportion with the speed of the engine.

$$\therefore \text{Resistance of blast pipe} = 1.75 \times \frac{30}{10} = 5.25.$$

$$\therefore \text{Total pressure} = 21.8969 + 21.8969 \times \frac{1}{2} + 5.25 = 18.40275 \text{ lb.}$$

Then number of revs. of driving wheel per minute

$$\frac{5280 \times 30}{60 \times 6 \times 3.1416} = 140.$$

\therefore Number of strokes = $140 \times 4 = 560$, and the volume of steam discharged,

$$= \frac{100}{144} \times \frac{3}{2} \times 560 = 583 \text{ cubic feet.}$$

Now the number of cubic feet of steam, at a pressure of 45.275, produced from 1 cubic foot of water, is 594.

NOTE.—This result is obtained by the formula given by Tate, $V = a + b P^a$, i. e.,

$$V = 12.5 + 20670 \times 45.275^{.2222} = 594.$$

\therefore Number of cubic feet of water evaporated per minute = $\frac{583}{594} = .982.$

And as one bushel of coal evaporates 11.5 cubic feet of water,

\therefore Number of bushels consumed per minute =

$$\frac{.982}{11.5} = .0854.$$

\therefore The total number of bushels =

$$\frac{120}{30} \times 60 \times .0854 = 20.5, \text{ nearly.}$$

W.

QUESTIONS FOR SOLUTION.—IX.

Arithmetic and Algebra.

32. A, B, and C, together, can reap a field in 4 days, which would take B and C $5\frac{1}{2}$ days, or A and B 6 days. How long would each of them be doing it by himself?

33. If I sell Three Per Cent. at 98, at what price must I purchase Two and a Half per Cent. to add 5 per cent. to my income?

34. A certain village cost its proprietor £30,000. Supposing it to pay a rental of 5 per cent. on the outlay, and to be assessed 20 per cent. below the actual rental, what will a rate of 6d. in the pound produce?

35. Given, $7x + 8y = 127$, and $8x + 7y = 125$, find x and y .

Geometry.

16. The superficial content of a cone is required, the diameter of whose base is 16 inches, and whose height is 20 inches.

17. The wheels of a chaise, each 4.5 feet high, in turning within a ring, moved so that the outer wheel made three turns while the inner wheel made two; their distance from each other was 5 feet 6 inches. What were the circumferences described by them?

18. The height of a cylinder is 20 feet, and the diameter of its base 2 feet 6 inches. What is its superficial contents?

Mechanics.

15. A train of 100 tons moves at the rate of 10 miles per hour when the steam is cut off. How far will it go before it stops, the friction being 4 lb. per ton, and the resistance of the atmosphere 3 lb. on the whole train, when it moves at the rate of 10 miles per hour?

16. What is the pressure on a flood-gate, whose breadth is 6 feet, and depth 10 feet?

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. X.—ON STYLE.

LANGUAGE is the natural interpreter between soul and soul; and Style is that genuine and beautiful product of the mind by which the results, distinctions, combinations, and connexions of systematic thought are transfigured and glorified. The play of feature, however delicate and exquisite—the smile of modest admiration—the changing cheek—the writhing lip—the contorted frame—the passion-clouds upon the brow—"the heavenly Rhetoric of the eye"—all the infinite variety of bodily gesture or facial expression—while they may become, and indeed often are, admirable exponents of human *emotions*, are very far from being capable of giving adequate symbolic manifestations of those intellectual activities whose results are *thoughts*. Speech alone is capable of imparting that appropriate explicitness to the conceptions of man which they require. It is only through the possession of this faculty that man is enabled "to seize, at once, the roving thought, and fix it," and thus embody and incarnate the results of the processes of the Intellection in

"Eloquence which, like the vows of love,
Can steal suspicion from the hearts
Of all that listen."

Only by this can the spiritual element in our nature be fittingly revealed, and our faculty of thought be thoroughly and effectually disciplined. The inward and unseen is thus rendered visible, and the outward sign enables our thoughts to pass current through the world. To give clear utterance to clear thoughts is the chief requisite in Style. To effect this, words must be well chosen, correctly arranged, and pertinent to the topic of discourse; they must be grammatically and logically assorted before they can be either eloquent or persuasive. The acquisition of the power of employing an apt transparency of Language—of picturing forth our thoughts in clear, cogent, felicitous diction—of using the simplest language with elegance and the most adorned with ease and propriety, and of adding the charms of grace and beauty to those "winged accents" in which we give utterance to our ideas, while it is of vast importance as an *end*, is of still greater moment when regarded as the *means* by which our own souls are educated, as well as the medium through which we educate the souls of others. Hence it is that "*Nobis prima sit eloquentiæ virtus, perspicuitas, propria verba, rectus ordo, non in longum dilata conclusio; nihil neque desit neque superfluit.*"* The vital importance of accuracy, in the art of thought-expression, will be perceived at once; but as there are other accompanying graces

* "To us Perspicuity should be the chief excellence of Style, proper words, an accurate arrangement, a period not drawn out in length; nothing should be wanting, nothing should be superfluous."
—Quintilian's "*Institutes*," lib. viii.

of Style to which some attention is requisite, we shall distribute our remarks in a classified form, under the six following topics, viz.,—Perspicuity, Conciseness, Unity, Strength, Vivacity, and Harmony,—which comprise all the most essential qualities of Style, so far as regards the structure and arrangement of sentences.

I. "PERSPICUITY consists in the using of proper terms for the ideas or thoughts which we would have pass from our own minds into those of other men. It is this that gives them an easy entrance; and it is with delight that men hearken to those whom they easily understand. Whereas what is obscurely said, dying as it is spoken, is usually not only lost, but creates a prejudice in the hearer, as if he that spoke knew not what he said, or was afraid to have it understood."* It entirely objects to the couching of our ideas in vague, inaccurate, obscure, or ambiguous phraseology, where the thoughts

" Flit before the mind,
As flit the snow-flakes in a winter's storm,
Seen rather than distinguished."

It demands the constant and uniform employment of such words, phrases, and idiomatic constructions as shall make the conceptions of our minds clear, obvious, and easily comprehended. The outlines of our thoughts must be sharply defined, boldly sketched, distinct, complete, carefully discriminated and demarcated from everything similar, as well as harmoniously consorted with each other. "Without this," says Dr. Blair, "the richest ornaments of Style only glimmer through the dark, and puzzle instead of pleasing the reader" or hearer. "Man," says William von Humboldt, "speaks *because* he thinks." Language ought, therefore, to exhibit thought, not conceal it. The man who cannot speak plain truths in plain words is, so far at least as his hearers or readers are concerned, as despicable as the man who will not. Those who listen or read have a right to expect that no unnecessary confusion, embarrassment, or inconvenience—no difficulty not unavoidably incident to the subject—should be imposed upon them; but that they should receive as much instruction and pleasure, at the smallest possible expense of time and thought, as the case will admit of. It is true, that in some cases a writer cannot give his thoughts the eloquence of beauty; but he may at all times bestow on them that much more requisite eloquence—perspicuous utterance. It is true, that men generally delight in perusing those works in which,

" With the light of thoughtful reason mixed,
Shines lively fancy and the feeling heart."

But the chief *sine qua non* of delight is a clear and ready comprehension of the ideas presented to the mind. This can only be produced when the meaning of a sentence, or a collocation of sentences, is so transparent as not only to render misunderstanding difficult but impossible. As quickly as one reads, supposing him to have an average acquaintance with the language, combined with ordinary intellectual powers, so quickly should he understand. If he must laboriously reflect, carefully remember, frequently pause to reconsider, re-examine the context, re-read the sentences, or is otherwise hindered from discovering the intended meaning, the Style is defective in Perspicuity. When sentences are

* Locke's "Some Thoughts concerning Reading and Study."—Works, vol. iv. p. 601.

so composed that there is no mistaking the signification—when one meaning alone, and that the one intended, can be found in the passage—the *jus et norma perspicuitatis* have been obeyed. Words taken singly have many significations; in composition, however, they lose their individual meaning, and form, by their syntactic junction, one special expression, indicative of the whole thought which is intended to be unfolded at the time. The many consignificancies which each word bears must be carefully noted; the one meaning capable of becoming, in conjunction with the needful accessorial and adjunctive terms, the exponent of the special idea requiring exposition, must be adopted, and the whole sentence must be so arranged that the precise and exact conception shall necessarily and inevitably arise in the mind of the party addressed, and that all other interpretations may be as absolutely excluded. It is, of course, quite evident that there are two pre-requisites to the attainment of such a manner of composition, viz.—1st. A complete and accurate knowledge of the language in which we speak or write, and a ready practical mastery of it; 2nd. Logical precision of thought. If the medium through which ideas are to be viewed is deficient in transparency, an accurate acquaintance with them cannot be gained; and if the ideas themselves be hazy and indistinct, no clearness in the medium can possibly make them capable of being accurately observed. Thought being the primary, demands the chief attention; for Horace truly remarks, “Scribendi recte sapere est et principium et fons.”* If we suppose the possession of clear thoughts, then a proper choice and collocation of words should secure the perspicuity of the sentence. It is very true, however, as Archbishop Whately says, “that perspicuity is a relative term, and, consequently, cannot be predicated of any work without a tacit reference to the class of readers or hearers for whom it is designed; and also that it is not inconsistent with ornament and conciseness;” and this ought to be kept distinctly in view in forming our judgment regarding any work.

Having thus explained what is meant by the term Perspicuity, we shall lay before our readers, in the form of rules, a few of the chief points involved in the subject.

I. The words and members which constitute a period ought to be so arranged as to secure syntactical completeness and accuracy; or, in other more specific terms, adjectives, relative pronouns, participles, adverbs, and explanatory clauses, should be placed as near as possible to the words to which they relate, and in such positions as shall make their reference quite apparent. Nouns and pronouns should, in general, be placed immediately before or after the verbs with which they are connected; prepositions should always precede the nouns they govern, and conjunctions ought to stand between those words or clauses which they are intended to conjoin. This rule is frequently violated. The following instances of the neglect of it may be quoted, viz.:—

1. “There is, among the people of all countries and of all religions, a belief of immortality, arising from the natural desire of living, and strengthened by tradition, *which* has certainly some influence upon practice, and some effect in fortifying the soul against the terrors of death.”—*Lindsay's Sermons*. *Which* should follow *immortality*.

2. “And, indeed, in some cases, we derive as much or more pleasure from that source than from the thing itself.”—*Burke on the Sublime and Beautiful*. Better thus:—And, indeed, in some cases, we derive as much pleasure from that source as from the thing itself, perhaps more.

* “To think well is the first principle and fountain of correct writing.”

3. "The young
Gather their joys up underneath the tears
Of aged eyes—moist, perishable joys ;
And scarce the dew has dried upon the leaf,
Than they, too, fade."—*Smith's "Sir William Crichton."*

Than should be *Ere*.

4. "Above rolled the planets, each, by its own liquid orbit of light, distinguished from the inferior or more distant stars."—*Scott's "Guy Mannering."* *Distinguished* ought to follow *each* and precede *by*.

5. "Chaucer followed nature everywhere, but was never so bold to go before her."—*Dryden's "Essay on Dramatic Poetry."* *As* should follow *bold*, as the correlate of *so*.

6. "Thales was not only famous for his knowledge of nature, but for his moral wisdom."—*Enfield's "History of Philosophy."* Should be—Thales was *famous* not only for, &c.

7. "Nor is the reason difficult to be discerned which has led to the establishment of this moral law."—*Mackintosh's "Dissertation on Ethical Science."* Better thus:—Nor is the reason which has led to the establishment of this moral law difficult to be discerned.

8. "There are a sort of spirits fall but once,
But that once is perdition."—*Smith's Dramas—"Guidone."*

Better thus:—

There is a sort of spirits who fall but once,
But that once is perdition.

II. Ambiguity or obscurity arising from the uncertain meaning of words, their equivocal reference to each other, the use of the same word in different senses, or different words in the same sense, and the introduction of such parenthetical clauses as are not absolutely necessary, ought to be carefully guarded against. The following sentences may be quoted as illustrations of the sort of errors against the committal of which this rule warns us, viz.—

1. "Any reasons of doubt which he might have in this case, would have been reasons of doubt in the case of other men, who may give more, but cannot give more evident signs of thought than their fellow-creatures."—*Bolingbroke's "Philosophical Essays,"* i. sect. 9. This sentence would be improved by saying,—who may give more numerous, &c., or by using the adjective *clearer* instead of *more evident*.

2. "God hath given to man a busy soul, the agitation whereof cannot but through time and experience work out many hidden truths; to suppress these would be no other than injurious to mankind, whose minds, like so many candles, should be kindled by each other."—*Hall's "Occasional Meditations."* *These* should be *this*, if, as we presume, it refers to *agitation*: if the antecedent be *truths*, the sentence is correct; but, as the agitation of the busy soul of man is the means by which many hidden truths are wrought out, we apprehend that the former is the intended word.

3. "Of the nineteen tyrants who started up under the reign of Gallienus, there was not one who enjoyed a life of peace or a natural death."—*Gibbon's "Decline and Fall of the Roman Empire."* As a man cannot be said to *enjoy* death, even when *natural*, some other verb seems wanting to express the author's meaning; perhaps the insertion of the word *died* immediately after *or* would be the easiest emendation.

4. "There are so many advantages of speaking one's own language well, and being a master of it, that, let a man's calling be what it will, it cannot but be worth our taking some pains in it."—*Locke*. Better thus, perhaps:—There are so many advantages of speaking one's own language well, and being a master of it, that, whatever a man's calling may be, the study of his native language cannot but be worthy of some pains.

III. The bombastic, the puerile, the inconsistent, the would-be-profound, ought, as much as possible, to be avoided. The following are instances of the neglect of this rule, viz.—

1. "My wound is grent, because it is so small."—*Dryden*.
2. "Just as the mighty rains,
Which, gathering, flood the valleys in the days
Of autumn; or as rivers, when snow decays,
Sweep all things in their course, till nought remains
Distinguishable."—*Barry Cornwall's "Marcian Colonna."*
3. "Slow sinks more lovely, ere his race be run,
Along Morea's hills, the setting sun,
Not as in northern climes, obscurely bright,
But one unclouded blaze of living light."—*Byron's "Corsair."*
4. "Our flag the sceptre all who meet obey."—*Ibid.*
5. "From harmony, from heavenly harmony,
This universal frame began;
From harmony to harmony,
Through all the compass of the notes it ran,
The diapason closing full in man."—*Dryden*.

6. "The Carthagenians were remarkably *precious* of the blood of their own citizens, while they lavished that of their mercenaries with reckless prodigality."—*Keightley's "Rome."* *Precious* should be *careful*, or some word of similar signification.

IV. To make periods more lengthy than is absolutely necessary is a great fault.

"The greatest error of all the rest is the mistaking or misplacing of the last or farthest end of knowledge; for men have entered into a desire of learning and knowledge, sometimes from a natural curiosity—an inquisitive appetite; sometimes to entertain their minds with variety and delight; sometimes for ornament and reputation; and sometimes to enable them to victory of wit and contradiction, and most times for lucre and profession; and seldom sincerely to give a true account of the gift of their reason to the benefit and use of men; as if there were sought in knowledge a couch whereupon to rest a searching and restless spirit, or a terrace for a wandering and variable mind to walk up and down with a fair prospect, or a tower of state for a proud mind to raise itself upon, or a fort or commanding ground for strife and contention, or a shop for profit or sale, and not a rich storehouse for the glory of the Creator and the relief of man's estate."—*Bacon's "Advancement of Learning."* This period, we believe, might be, with much advantage to the sense, as well as ease to the reader, redistributed, and composed into different periods, thus, perhaps:—1. The greatest error of all the rest is, the mistaking or misplacing of the last or farthest end of knowledge. 2. Men appear to have entered into a desire of learning and knowledge, sometimes from a natural curiosity—an inquisitive spirit, sometimes to entertain their minds with variety and delight, sometimes for ornament and reputation, and sometimes to enable them to [acquire the] victory of wit and contradiction. 3. In most cases, however, professional purposes and the acquisition of lucre are the moving causes. 4. Seldom do men seek wisdom sincerely to give a true account of the gift of their reason to the benefit and use of man. 5. It oftener seems as if there were sought in knowledge a couch whereupon to rest a searching and restless [unquiet?] spirit, or a terrace for a wandering and variable mind to walk up and down with a fair prospect, or a tower of state for a proud mind to raise itself upon, or a fort or commanding ground for strife and contention, or a shop for profit and sale, and not [instead of?] a rich storehouse for the glory of the Creator and the relief of man's estate. —The words in italics represent the changes rendered necessary by the suggested variation of style from the involved period to the simple: those in brackets seem necessary to complete or improve the sense.

The examples which we have thought it necessary to adduce have occupied so much of our space that we have but little more at our disposal for the present paper. Before concluding, however, we may be permitted to quote, from one of the great men of the nineteenth century, a distinction which ought to obtain between two terms which have been

frequently employed in this article, viz., ambiguity and obscurity:—"Ambiguity is where the effect of the expression employed is to present in conjunction divers imports, in such sort, that though to the individual mind in question it appears clear enough that in one or other of them is to be found the import which was intended to be conveyed, yet *which* it is that was intended to be conveyed is matter of doubt. Obscurity is where, of the expression employed, the effect is, for the present at least, not to present any one import as that which was intended to be conveyed. In the case of *ambiguity*, the mind is left to float between two or some other determinate number of determinate imports;—in the case of obscurity, the mind is left to float amongst an indeterminate, and it may be an infinite number of imports. Obscurity is ambiguity at its *maximum*."* The only method by which these defects of style may be fully and fairly escaped, is to aim in our writing so to choose and colligate our terms that we may observe Quintillian's general rule for perspicuous composition, and write, *Non ut intelligere possit, sed ne omnino possit non intelligere curandum; i. e.,* Not that the hearer may understand if he will, but that he may understand whether he will or not.

Philosophy.

IS WOMAN MENTALLY INFERIOR TO MAN?

NEGATIVE REPLY.

"The very first
Of human life must spring from woman's breast;
Your first small words are taught you from her
lips;
Your first tears quenched by her, and your last
sighs
Too often breathed out in a woman's hearing,
When men have shrunk from the ignoble care
Of watching the last hour of him who led them."
BYRON.

WE shall, perhaps, best please our friends, and at the same time pass the highest compliment in our power upon our opponents, if we abstain from any minute or critical examination of their several papers upon this interesting question. Their arguments have been so weak, so mystical, so rambling, and, withal, so far-fetched, that we have strong reason to doubt if any of them can boast the virtue of *sober seriousness* in the course they have pursued; in other words, we believe more credit to be due to their *hearts* than their heads: they have *meant* right, but gone wrong!

It would, perhaps, occupy the greater part of the present paper simply to classify and arrange what they have *endeavour'd* to say, and then, without more ado, to dismiss the whole with a glance of mingled scorn and pity; but our intention is to make light work of it.

With the exception of what has been said by the affirmative writers in favour of our view of the question (and each of them has given us *some* assistance), their efforts seem to have been almost entirely directed to prove that the mental power of woman is *not equal* with that of man, because *not identical*. In the onset we took some pains to prevent the discussion from assuming this turn. Nothing can be more unjust, or more unreasonable. Do we expect to find the perfume of the violet imparted to the majestic sunflower, or the fragrance of the rose emitted by the forest oak? Each has its own peculiar qualities; but no one would dare to call one of these *inferior* to

* Bentham's "Nomography; or, the Art of Inditing Law Works," vol. iii.

the other; neither would they, were the diversity ten times greater. Each is constituted properly to fulfil the office assigned to it.

What has been the nature of the illustrations adduced in support of woman's mental inferiority? Catalogues of illustrious statesmen, historians, philosophers, poets! We should lament the destiny of the sex if we saw women rushing into a contest with men in all or any of these pursuits. But why do these writers overlook one important fact in connexion with this very point? Why so lavish in the admiration of great men, and so niggardly in yielding due honour to those who laid the foundation of their greatness? Read the lives of our most illustrious princes, heroes, poets, authors, divines, and in the majority of instances stands the recorded fact that their greatness is to be attributed to their MOTHER'S influence. It is a characteristic of woman that she exercises her influence rather than displays it: but honour is none the less hers. The reply of Madame Campan to a question from Napoleon, and his rejoinder, are directly to the point. The emperor, complaining of the old systems of education, asked, "What is wanting in order that the youth of France be well educated?" "*Mothers*," replied Madame Campan. The emperor seemed struck with the aptness and truthfulness of the reply, and, after a pause, said, "Here is a system of education in one word." And never man spoke more truly. It is the province of the mother to impart that electric influence which shall awaken the energies and quicken the genius of her offspring, and the extent of this influence will depend upon her mental power and capacity.

A writer in the "Westminster Review," some time since, beautifully illustrated this truth in the following passage:—"The true woman speaks to every true man who sees her, refining and exalting his intellect, and making him know that true manhood consists in the noble action of his soul. She sends him from her with all the subtle threads of his being in firmer tension, and remembering that he, too, is only a little lower than the angels! She can make him work, and dare even death for his work, and his heart ever beating with the love of the highest love. She can do this without knowing it, *because her genius is influence*. Yes; to warm, to cherish into purer life and

motive that shall lead to heroic act—this is her genius—her madness—her song flowing out—she knows not how—going she knows not whither, but returning never again. The woman evenly developed—unfolded after her own type—the one God struck approvingly when she was created—*differs from man, then, in this—in possessing a greater capacity—a greater genius to influence*. She influences through no direct exercise of power, but because she *must* influence. Influence breathes from her, and informs every thing and creature around, *and we are only conscious of it by its results*."

About the same time the "Edinburgh Review" very ably and impartially examined this question. We shall not hesitate to extract a passage or two bearing with peculiar force on the point before us:—

"Men in general," says the writer, "when serious and *not* gallant, are slow to admit women even to an equality with themselves; and the prevalent opinion certainly is that women are inferior in respect of intellect. This opinion *may* be correct. The question is a delicate one. We very much doubt, however, whether sufficient *data* exist for any safe or confident decision; *for the position of women in society has never been—perhaps never can be—such as to give fair play to their capabilities*. It is true, no doubt, that none of them have yet attained the highest eminence in the highest departments of intellect. They have had no Shakespeare, no Bacon, no Newton, no Milton, no Raphael, no Mozart, no Watt, no Burke. But while this is admitted, it is surely not to be forgotten that these are a *few* who have carried off the high prizes, to which millions of *men* were equally qualified by their training and education to aspire, and for which by their actual pursuits they may be held to have been contending; while the number of *women* who have had either the benefit of such training, or the incitement of such pursuits, has been comparatively insignificant. When the bearded competitors were numbered by thousands, and the smooth-chinned by scores, what was the chance of the latter? or with what reason could their failure be ascribed to their inferiority as a class?"

Again:—"High art and science always require the whole man, and never yield their great prizes but to the devotion of a life. But the life of a woman, from her cradle upwards,

is otherwise devoted; and those whose lot it is to expend their best energies, from the age of twenty to the age of forty, in the cares and duties of maternity, have but slender chances of carrying off these great prizes. It is the same with the high functions of statesmanship, legislation, generalship, judgeship, and other elevated stations and pursuits, to which some women, we believe, have recently asserted the equal pretensions of their sex. *Their still higher and indispensable functions of maternity afford the answer to all such claims.*"

But "it is in literature that women have most distinguished themselves; and probably because hundreds have cultivated literature for one that has cultivated science or art. Their list of names would rank high even among literary males. Madame de Staël was certainly as powerful a writer as any man of her age and country; and, whatever may be the errors of George Sand's opinions, she is almost without a rival in eloquence, power, and invention. Mrs. Hemans, Miss Edgeworth, Miss Baillie, Miss Austen, Mrs. Norton, Miss Mitford, Miss Landon, are second only to the first-rate men of their day, and would probably have ranked even higher, *had they not been too solicitous about male excellence*—had they not often written from man's point of view instead of from woman's.

* * * So true is this, that, in the department where they have least followed men, and spoken more as women—we mean in fiction—their success has been greatest. Not to mention other names, surely no man has surpassed Miss Austen as a delineator of common life? Her range, to be sure, is limited; but her art is perfect. * * * In all she attempts she is uniformly and completely successful."

The purport of the foregoing observations is clearly to show that, although the mental capacities of the sexes are constituted in conformity with the difference in their pursuits and destinies, still, where circumstances have been favourable, females have very closely approached to male excellence; but that, chiefly, their higher powers and energies became absorbed and concentrated in the noble office of *maternity*. If those by whom our first impressions are to be awakened lack mental power, what hope is there for our after-progress! The number of learned men *who have adorned our country* is one of the

most substantial proofs of woman's mental excellence. Of such a mother as we are speaking the poet gives us the following picture:—

"Where dawns the high expression of a mind
By steps conducting our enraptured search
To that eternal Origin, whose power,
Through all the unbounded symmetry of things,
Like rays effulging from the parent sun,
This endless mixture of her charms diffused."

Of the possession of this quiet but important power in women Milton must have been fully aware, for we find him exclaiming in "Comus":—

"All higher knowledge in her presence falls
Degraded; wisdom in discourse with her
Loses, discountenanced, and like folly shows;
Authority and reason on her wait,
As one intended first, not after made
Occasionally; and, to consummate all,
Greatness of mind, and nobleness, their seat
Build in her loveliest, and create an awe
About her, as a guard angelic placed."

Notwithstanding all this, Milton is said to have been a hater of women!

The poets, one and all, seem to have formed a correct opinion of woman's influence and power. In addition to those quoted in our opening paper, we find Alfred Tennyson reminding us—

"The woman's influence, and the man's,
They rise and fall together;"

while Wordsworth pictures before us

"A perfect woman, nobly plann'd
To warn, to comfort, and command."

America sends us an additional and graceful wreath, through her poet Eastburn:—

"Woman! blest partner of our joys and woes!
Even in the darkest hour of earthly ill,
Untarnished yet, thy fond affection glows,
Throbs with each pulse, and beats with every
thrill!
Bright o'er the wasted scene, thou hoverest still
Angel of comfort to the sailing soul."

When sorrow rends the heart, when feverish
pain
Wrings the last drops of anguish from the brow,
To soothe the soul, and cool the burning brain,
Oh, who so welcome, and so prompt as thou!
The battle's hurried scene and angry glow,—
The death-encircled pillow of distress,—
The lonely moments of secluded woe,—
Alike thy care and constancy confess,
Alike thy pitying hand, and fearless friendship
bless!"

And Shakspeare boldly tells us—

"However we do praise ourselves,
Our fancies are more giddy and unfirm,
More longing, wavering, sooner lost and won,
Than women's are."

In all countries, and in all ages, the good, the heroic, the beautiful, have been associated with woman. Think you, then, reader, that these excellences could be made so world-wide and enduring unless emulated and supported by high mental power?

"Mind, mind alone, bear witness, heaven and earth.

The living fountains in itself contains
Of beautiful and sublime!"

We are quite prepared to admit, with one of the authorities we have quoted, that, with the public, the question is, and will remain, for a time at least, an unsettled one. Man-kind are slow to decide against their own prejudices. The matter rests chiefly on the adoption of improved systems of *female education*. How frequently we meet in female society "human flowerets," destined by nature

"To grace in their degree a throne,
Or any rank adorn,"

yet completely crushed in the bud by the superficial and tawdry education they have received.

But we hope the days of such a system are numbered. Public discussion is, perhaps,

under the circumstances, the most efficient remedy. We are glad to have been instrumental in lending a helping hand to a good cause.

We cannot, perhaps, more appropriately dismiss this subject than in the following eloquent words of Dr. Blair:—"The prevailing manners of an age depend more than we are aware of, or are willing to allow, on the conduct of the women; this is one of the principal things on which the machine of human society turns. Those who allow the influence which female graces have in contributing to polish the manners of men, would do well to reflect *how great an influence female morals must also have on their conduct*. How much, then, it is to be regretted that women should ever sit down *contented to polish, when they are able to reform—to entertain, when they might instruct*. Nothing delights men more than their strength of understanding, when true gentleness of manners is its associate; united, they become irresistible orators, blessed with the power of persuasion, fraught with the sweetness of instruction, making woman the highest ornament of human nature." C. W., Jun.

AFFIRMATIVE REPLY.

"ALL OUR KNOWLEDGE IS, OURSELVES TO KNOW."

"Tis hard to say, if greater want of skill
Appear in writing or in judging ill;
But, of the two, less dangerous is the offence
To ure our patience, than mislead our sense."

THE most difficult and unsatisfactory of all labours proverbially is, to controvert those statements which will only allow of the supposition of their being argumentative, because they appear in a controversy, and are given professedly to support certain opinions. Some writers believe there is ample proof afforded, if they collect quotations and comment on the "authority" discoverable in them; while others will confine themselves to extracts selected from their opponents, and, having gathered a few sentences and "illuminated" them, they close the question with appeals terminating in "reason," "justice," "generous man!" "wide view," "magnanimous," and the like, doubtless imagining that such a process clearly demonstrates the seminal error of their antagonists. Some of the articles under our consideration fully

substantiate the truth of these remarks; and this is the more remarkable since they contain much strong language about "arguing," "arenas," "confronting darling opinions," and "carrying on controversy in that," &c. One writer has elaborately unfolded the due effects of certain acts, dilemmas, and transpositions, but immediately afterwards he disappeared in the haze of assertion. Another has seized upon a particular aspect of his private view of the case, and, taking its truth for granted, distended it into monstrous proportions; hence concluding that, because one or more of them contravene the tenets of an opponent, therefore he himself vindicates truth; *ergo*, all others do not.

Now, is not this the most acceptable method for disputation, that sentiments be founded upon adequate causes, and *both* mentioned? And, if principles were dealt with instead of particulars, then there would be a guarantee for the philosophic treatment of subjects. Besides, when there is a candid and unreserved exposition of the grounds of belief, together with care and intelligent

study in educating and collating them, we are furnished with the best of mere mechanical tests for truth. Not that we suppose that all men may, by any means, be induced to think precisely alike; on the contrary,

"Tis with our judgments as our watches; none
Go just alike, yet each believes his own."

Nevertheless, that there are laws of belief, and that those laws are common to the human mind, are undisputed propositions.

T. F. O. insists upon an "arrangement," about which, we have no doubt, he speaks truly in saying that elsewhere it is not to be found. Now, we shall not dispute with him concerning the essential difference between tone, texture, and temperament; but it would not be just to refrain from remarking on his definitions and use of terms. In one place he defines "capacity" as being "the intellect's power of comprehension," and "great capacity, *the power of laying hold of great ideas!*" This "lame and impotent conclusion" is supplied, because he is fully aware of something particular and definite being required! Subsequently he tells us that "great capacity, when applied to the feelings, means *depth of emotion, strength of impulse*, and is dependent upon a *large development* of the brain." Where, then, is the sphere for his fine, vigorous, and temperamental properties? Did it never strike you, T. F. O., that there is a glaring impropriety in applying the epithet, *laying hold of great ideas*, as equivalent to mental perceptivity? Of the vague, accommodating terms, "comprehension," "capacity," "great ideas," he makes frequent use, and fully avails himself of their singular power of collocation. The two first named he employs to indicate an innately active power *common* to the mind; but what that power is, in virtue, he has not mentioned, further than that it is the mind's capacity for laying hold of great ideas. Now, if he had but made it to apply particularly, we might, without doubt, have arrived, at least, at some plausible conclusion: *e. g.*, in the case of the phrenological faculty, number, it is not difficult to suppose that the comprehension of that organ—otherwise, its great capacity—was intended to be equal to *appreciation*, and to imply the power of appreciating the values of numbers; while tone, texture, or temperament would be admissible for supply-

ing the vigorous element. This arrangement, then, possessed in a high degree by an individual, enables him to be rapid in performing calculations, and exact in estimating values. But how to apply this interpretation to many of the numerous mental organs which have an existence of quite as certain entity, we are, indeed, at a loss. Would not the theory on texture, since delicacy of touch is one of its chief exponents, elevate the blind above humanity in general? And is it so?

T. F. O. does not attempt to substantiate any of his positions; yet he acknowledges *some* of them to be novel. He is doubtless, aware that Whately's *onus probandi* hypothesis has exploded. Nowhere does he distinguish between a principle and an example. The entire absence of unity and perspicuity in exhibiting his subject, and of argument to enforce his propositions, places his article in precisely the same position as that in which a "king" stands when solitary on a chess-board; it is useless to the defendant, and not to be captured by the adversary. The assumptions, therefore, with which we disagree, are met by simply propounding the *retort courteous*. His article, had it been, as professed, purely didactic, would have been useful; but as it is, it assumes the judge, and rejects the summing up.

We now turn to survey the position of C. W., Jun. We cordially agree with his preliminary remarks. Opinion *does* give

"Report of good or evil, as the scene
Was drawn by fancy, lovely or deformed:
Thus her report can never there be true,
Where fancy cheats the intellectual eye."

But we object to his first aspect of the question. If the illustration proves anything, the evidence is inadmissible, unless we accept the proposition of man never venerating things beneath himself—a proposition not to be maintained. And we must not believe that purely abstract admiration, and appreciation for the beautiful, are the only elements of love: abstruse self is the primary source.

The "scale" of this writer also appears just; it certainly has the merit of being philosophic; hence it claims respect. But, while concurring with the view which it exhibits, we strongly deny the inference. The solution we admit, but the conclusion we reject; and, unfortunately, C. W., Jun., has not advanced proofs establishing the legitimacy of this weighty result. What that result would

involve, were it demonstrated, may be inferred from the fact of its appearing on the negative. Unquestionably, the quotations are produced as testimony, testimony being considered equivalent to proof. Here lies a fallacy. The quotations are nothing more than the moment-prompted opinions of some ten men whose persuasions appear to be collateral with C. W., Junior's.

Now, as the forthcoming reasoning applies to the basis of every adversary's defence, we advance it with due care and deference, at the same time being fully convinced that its truth extends to the minutest point, as well as that it forms a complete vindication of our advocacy. First, then, as C. W., Jun., has not provided definitions, we submit a definition and reduction of those hackneyed, vague terms, "intellectual," "moral," and "social." Intellectual appears to denote that combination of those faculties which produce the effects which are said to result from thought, reflection, or study. The moral faculties are those which prompt rectitude: hence the term moral, or justice. It is the province of the social order to be the source of whatever actions—whether hidden or exposed—are referable to that "fellow feeling" which "makes us wondrous kind." Reducing this abstract feeling, or sympathy, and tracing it to its mental source, we find that it springs from a certain pure, unbounded, Platonic benevolence. Now our friend takes up the subject on phrenological grounds. The organ of benevolence, then, is our object. This faculty, considered accordingly, is one of the *blind propensities*. That this is the true definition all will acknowledge. Observation says so. Hence, therefore, the organ in itself has no intelligence; its action on the mind is that of merely an *abstract faculty*. Now mark the context, for in it here lies the culmination. The faculty cannot be governed. To what, then, must it be referred for guidance? Obviously, to the thinking, the reflective, the perceptive principles of mental constitution. But there are those which are granted to compose the intellectual; and the intellectual is that portion of the human mind which C. W., Jun., in common with each of our antagonists, has truly postulated to be in man predominant or woman. Here, therefore, is the final sequent; namely, that our adversaries, in making man to possess the superior intel-

lect, granted that for which we profess to contend; and more, alas! for the admission inevitably entails nullity on the first and essential principles of their own defence.

It is not a little strange that C. W., Jun., does not enunciate the causes for the Hindoo fortitude, constancy, &c., which he affirms of woman when involved in the dilemmas at which he hints. And as it is dubious whether superiority in such cases is an infallible proof or sign of *mental* superiority, we shall not consider the matter more in detail than by requesting an inference from the foregoing reasoning, and in referring him to the works of Miss S. Stickney.

Agreeing with much that J. S. J. says, and believing that the particulars in which we differ are removed by the above, we pass over his article by merely remarking that, doubtless, second thoughts will ask him to state definitely, and to prove that statement when made, in what way "literature, legislature, and the arts, are governed by women, perhaps, more than by men."

S. A. J. may be considered to be already fully noticed. We next come to the anomaly of J. N. C. This writer appears to cultivate aspirations for the beautiful: he invokes Wisdom to lead him, and to "teach his best reason, reason;" but, unhappily, he has caused the purity of truth and beauty to be enshrined in the *Idola Tribus*. Puerile and hackneyed sentiments are here found embodied in high-flown, paltry gaudiness: in this guise they would pass for the genuine currency of enthusiasm.

But let it be seen. During the first four columns our friend appears to have performed very little more than introduce a *verbatim* copy of sentences from the opening paper into his own, and salute them with a profusion of apostrophes and interjections. To example a few instances:—First, let the essence and climax of proof and import, found between lines twenty and thirty of the second column of page 329 be perused, and its argument stated. Second, where is the proof of woman excelling in those "other fruits," and where is the difference between these fruits and those previously mentioned? Again, what does J. N. C. mean in the first column of page 329? Does he flatter himself that exhibiting an adversary's tenets in a light the most revolting to his own persuasions is a process calculated to affect the reason-

ruled judgment? Does he suppose that queries and adjectives are proofs and demonstrations? If so, we congratulate him. Farther—and here he takes a high position, appearing enveloped in all the sacred glory of a defender of the infringed mental dignity of the softer sex—Has J. N. C. read the paper he criticizes? If he has, his fiery indignation at the expected base insinuation clouded his brain, for he advocates our own sentiments!

Once more. By inadvertence the mention of the “poets” was omitted in the last paragraph of page 225. J. N. C. has unconsciously taken advantage of this omission.

We have now concluded, J. N. C. Go; let your faith in the “strong minded” be steadfast and unbounded; be valiant for your lady; study your standard authors in household education; attend to Catherine Phillips while she expounds the “deceitfulness of pleasure”—to Amelia Opie, “teaching the sinfulness of war”—to Mary Chandler, “proclaiming the blessings of temperance,” and learn, with Lady Carew, “to enjoy the duty of forgiveness;” for you must believe in Mrs. Grant, in Mrs. Tighe, in Mrs. Barbauld, in Mrs. Rowe, and in Mrs. Radcliffe, for these are all orthodox in doctrine, and are continually “shedding lustre o’er the intellectual world!” Never bear with the dim light of genius found in Johnson, or Paley, or Baxter, or Jenyns, or Watson; consider Brown, Barrow, Magee, and Combe, to be mere glowworms, virtually in the dark. But what a train of tapers has J. N. C. ranged against these eternal suns! The “Blind Boy,” J. N. J., has proselyted thee; therefore, what folly is it, and labour in vain, to attempt, by pen and ink, thy rescue into light and knowledge!

But, seriously. We desire, in conclusion, only what every one does in closing a question, *i. e.*, an impartially appreciative consideration, not of the forcibly-expressed sentiments, but of the grounds and inferences found in the conflicting papers. Now, one

or more of our friends have demurred on the legitimacy of the train of argument formerly advanced, condemning the principle as nugatory of appealing to things and effects in their *noumena* for initiation as to their source and efficient causes, as though it were folly to examine effects in order to ascertain causes. But if, indeed, this plan be wrong, why is it not shown to be such, or superseded by an improvement? The fact is, our friends are at a loss to find some specific principle on which they may base their assumptions. There is, therefore, no other plausible resource remaining to them except that of simply rejecting any such principle, be it found elsewhere. Now that principle, in the form of a “test,” was previously offered, and, as a natural consequence, rejected: the reasons for rejecting it are not mentioned; for, when the point of stating them arrived, parties discovered that, unfortunately, they have not left themselves *further space*; or if they did apply the said test, it was by contenting themselves with the plain state of matters, *i. e.*, adducing such comparisons and parallels as are nowhere discoverable but in those which Fluellen drew between Macdon and Marmouth. With this course, however foolish, they may be consoled by reflecting that it is, nevertheless, the best. In a comparison, *equality* must be present. In determining a species, it is not sufficient that two points are alike—the majority must balance. The inference we leave non-drawn.

In the discussion of vexed questions there is a certain element which *will* be present. Now, if the individuals on whose statements we have ventured stricture, perceive either harshness, or that paltry criticism which arises from egotism or undue zeal in factis, we heartily apologize, remembering the aphorism, *Magna est veritas, et praevalet*.

“Farewell, farewell!

For the dear God who loveth us,
He made and loveth all.”

SENOS.

MAINTAIN a constant watch at all times against a dogmatic spirit; fix not your assent to any proposition in a firm and unalterable manner, till you have some firm and unalterable ground for it, and till you have arrived at some clear and sure evidence—till you have turned the proposition on all sides, and searched the matter through and through, so that you cannot be mistaken.

History.

WERE THE EFFECTS OF THE CRUSADES FAVOURABLE TO THE CIVILIZATION AND MORAL ELEVATION OF THE PEOPLE?

AFFIRMATIVE ARTICLE.—II.

CIVILIZATION has not inappropriately been likened to the growth of a tree disciplined after the full fashion of nature. Through long years of summer and winter, sunshine and tempest, has it come to maturity; new seasons have wooed its buds, and soon dropped them in the chill of death, yet it has not only emerged complete from the variable influences affecting it, the seemingly unfriendly as well as the friendly, but completeness has been the *result* of this same admixture of circumstances. The shower and the sunshine were essential to life; but solidity required the hindrances of winter and the rockings of the tempest: without these the oak had never been the pride of the spot which gave it birth, nor the future bulwark of a nation.

In this common illustration the observant mind recognises but the operations of a still commoner law of being. It is the law which combines with the main purpose preparative and subsidiary schemes: it is the law which loosens the springs of existence, and again bends them for fresh activities: it is the law which unites the playground with the school-room, and makes the one indispensable to the other, if the sound body is to be retained in conjunction with a sound mind: it is the law which follows exercise by dormancy—singleness by the goad of trial and adversity: it refreshes the weary, scourges the indolent, restrains the morbidly exuberant, and disciplines alike the mind and the body for healthful, vigorous action. As in nature, as in individuals, so may it be observed in society at large, the one grand regulating principle, which has *retarded* but to infuse fresh energies, and chastened but to ennoble to a needed manliness of character. Out of this provision of an all-wise Governor is evolved the fruit of *progress*; and the philosophical student in his survey of history, and drawing conclusions therefrom, will not view its events in forgetfulness of this principle.

He will pursue the growth of nations—in other words, their growth in civilization and moral elevation—not only when learning, as a fair blossom, rejoices in the sunshine of royal favour, and the bright examples of the age are men of genius and virtue, but also when the checks of occurrences, apparently untoward, disturb for a time that regularity of progress so agreeable to the sanguine spirit. Where superficial observation would heave a sigh, or, it may be, recoil with horror, and thank heaven that the mischievous blunders of olden times had no longer their power, he, equally thankful for the dawn of better days, will place his hand, and say, “Here mankind needed tutorage, and received it; here human frenzies worked themselves out; here that which had been termed evil accomplished its purpose as a means to good.” He is unable, perhaps, to *mark* the operation: he is only conscious of its course. The most he is able to do in many cases is to observe the facts, leaving the lapse of many years to give the result; and even these, from a thousand causes, may baffle recognition; nevertheless, from those that are certain he has had proof upon proof of the general law; and now that the skies have grown dark, the winds high, and the strainings and creakings of society are portentous to the fearful of calamities at hand, as certain is he that the process is subservient to the ultimate improvement of the subject, as he must be when, in the world of nature, analogous indications determine the maturing of an oak; the process is, however, in both cases so slow and subtle as to be unobservable, and, possibly, the results beyond his means of witnessing.

Now it is upon this principle, the truth of which we think every one must acknowledge, that the influences of the Crusades must be estimated. The facts are awful—so strangely terrible. Horrors, multiplied and intensified by the vast numbers subjected to them, and

that unlimited excess which irresponsibility, as taught by the church, added to the peculiar charm of fresh gratifications for the passions, allured to:—whole nations, no longer bound by reason, prudence, the more powerful ties of affection, and the interests which had hitherto been of value, wandering forth to destroy, and to be themselves the victims of destruction:—desolation and death let loose upon civilization in her only refuges—surely must she fall their prey. Such, indeed, would be the first-view conclusion. If there lived in that age, when the military idea was the chief, as it was esteemed the worthiest, one of nobler mould than his fellows, and whose glory would have been the true elevation of mankind, how must his heart have sunk within him, how his fond anticipations of a coming deliverance been quenched, as he beheld events, which would have dumbfounded the faith of a prophet, transform a partly-civilized world into scenes of barbarity and woe. But future ages, which he would never see, would show how unnecessary were his apprehensions. The eternal law is faithful: its operation is, indeed, mysterious, and, as a means to good, difficult to follow. Bloodshed and violence, and their consequent miseries, are not the instruments which benevolence—finite benevolence—would choose for itself; for it has not, and, we confess, cannot have, at least by immediate perception, a conviction of their applicability. Still is the difficulty not where it is supposed to be, but in the weakness which advances it. To the all-wise Ruler of the universe there can be no difficulty—no inconsistency—in the relation which one part of his procedure bears towards another. Far from the view of man, he appoints means, operations, and effects, in harmonious combination. Let it not, then, be said that it is not consistent to argue for the Crusades as a means of benefit to mankind. We do contend that, by the existence of a divine regulation, adapted to the constitution of human nature, they could not have been otherwise. Where would have been the oak if it had nought but the sun to form it? if it had all to cherish, and nothing to discipline it? Precocious luxuriance there might have been; but not tenacious, enduring, storm-resisting power. So with civilization and moral elevation. They are not the children of the softer influences, tended by indulgence and matured

in unchangeable ease. Like all things else in the world which are of value, because of great service, they have sprung and derived their character from a mixed treatment, and owe much more to the rigours and adversities of their position, than to its genial but enervating elements. Disappointments, bereavements, the retributions of folly and error, the want which goads to industry, and that sense of degradation and oppression which precedes the determination to be free; these enter into the very existence of them; in short, *experience* schools the world into the blessings of civilization and moral elevation; and to talk, therefore, of their being retarded by those experiences, without which they never could have existed, is to speak that which is simply absurd.

It is, as we have before hinted, a difficult and often unsatisfactory task fully to recognise the effects of a certain set of events, because they may be lost in the vast mass of complexity of which they form a part; or, if not wholly lost, so blended with the rest that we hesitate to pronounce a cause. Happily, however, in the present case, we are in no dilemma. No sooner is the standard of the cross unfurled, than effects the most instantaneous and important are seen to follow. Christendom might hitherto have been divided into two classes—the oppressor and the oppressed. Now, in removing the one from his native sphere of domination, and the other from that of the most degraded obedience, the old relation is for ever broken. Men, wives, and children, are no longer in the list of chattels. No blow, surer of being fatal to feudalism, could have been struck, than that dealt by Peter the Hermit. But his services do not stop here. The tyrannical lords learn better manners towards each other, as well as towards the people at large. Their fierce jealousies and resentments are merged into one object of deep interest to all; they become courteous and polite, reciprocate the better feelings of their nature, and with the bad, which are embodied in the military passion, take the most natural course, as it is by far the wisest in a political point of view, of turning them against distant nations, rather than their own which they despise. The East and the West, who have long trampled on the liberties of mankind, now meet, and in long and bloody conflict learn the salutary lesson, that war is a

own destroyer. New tastes, new energies, are awakened; and priestcraft having made a mistake, and thereby shaken the general credence in its infallibility, is no longer potent over the minds of the people. With the constant migration of armies does the commercial necessity arise. Every voyage is a voyage of discovery: every march adds to the stock of fresh information. The acquisition of new knowledge stimulates to inquiry into the old, and thus are intelligence and commerce, the basis of a civilized community, taking the place of ignorance and semi-barbarity. These events, the most important effects of the Crusades, will not be denied: they are matters of fact too intelligible on the page of history to be questioned. It may be attempted to counterbalance the blessings they became to the world by a heavy set-off of temporary evils; but, if we bear in mind that these were the instruments by which elevation and advancement were secured—that out of them sprung, by the

most natural process, the social and political benefits we have been considering—we cannot commit ourselves to the inconsistent supposition that they also formed an obstacle.

Europe, especially Britain, owes much to the Crusades. Our forefathers erred, sinned, and were chastened for us; they “sowed the wind and reaped the whirlwind”—learned wisdom from adversity, and courage from danger, for our advantage. But we have not sufficiently profited from the teachings of this great moral cyclopædia. Society is now passing through a discipline which will leave it all the better. Let us look willingly and hopefully at our entire series of experiences: thus,

“Whate’er we see,
Whate’er we feel, by agency direct
Or indirect, shall tend to feed and nurse
Our faculties—shall fix in calmer seats
Of moral strength, and raise to loftier heights
Of love divine, our intellectual soul.”

B. W. P.

NEGATIVE ARTICLE.—II.

“THE present age” is a favourable theme with popular writers and speakers, and its various phases are certainly worthy of careful thought and close discrimination. “A thousand and one” voices assure us that it is an age of progress, and this we will not dispute, although we have a strong suspicion that much which is taken for progress is mere motion—movement in a circle—a constant change, without any real advance. It has been thus, we conceive, with the favourable opinion of the Crusades which is now so popular, though many persons regard it as a proof of intellectual progress and the augmented strength of independent judgment. But the pleasing delusion vanishes when the light of history is cast upon it, and we find that the same opinion generally prevailed in the seventeenth century, became unpopular in the eighteenth, and revived in the nineteenth; so that which has been held as a product of the present is but a figment of the past.

But a truce to preliminaries, and now to the immediate subject of our inquiry—the Crusades, or the religious wars for the recovery of the possession of the Holy Land, and their effects upon civilization.

At the onset our thoughts naturally turn

to the origin of the Crusades; and it is important that we should have clear and truthful ideas respecting that. C. W., Jun., with an attempt at generalization and philosophic research so common in these days, asserts that the Crusades arose “from a general effort on the part of the human mind to get into action,” and that their mission was “the emancipation of the human mind.” These sentences are high-sounding, but are they truth-telling? We think not. The Crusades originated in the superstitions of the dark ages, and more particularly in the delusive belief of the sin-atoning efficacy of a visit to

“The holy fields,
Over whose acres walked those blessed feet,
Which, eighteen hundred years ago, were nailed,
For our advantage, on the bitter cross.”

To such a degree was the superstitions regard for the *land* of Palestine carried, while the *truths* there promulgated were forgotten, that its very dust was adored, and brought to Europe as a charm against demons! To prove that miracles had not ceased in his time, St. Augustine tells a tale about the cure of a certain young man, who had some of the dust of the holy city suspended in a bag over his bed! If the hardships atten-

dant upon visiting Palestine, and the difficulty of obtaining *more dust* were the immediate causes of the Crusades, we fancy they present no indications of an effort, on the part of the human mind, "to rid itself of the many fetters which had impeded its development." We should like C. W., Jun., to inform us by what system of mental alchemy he has obtained the gold from these materials!

Such, then, was the origin of the Crusades; such the source of that wild and furious stream, whose poisonous waters spread barrenness on its banks, and prevented the lowly verdure or the towering tree flourishing within its influence.

Again, how unworthy the motives appealed to, to induce men to engage in these conflicts! The forgiveness of sin was promised to all, and a passport to heaven to such as might die on the battle-field. The promised result was valuable; the terms were easy, and therefore eagerly seized upon. "The moral fabric of Europe was convulsed; the relations and charities of life were broken; society appeared to be dissolved. The storm of public feeling was raised, and neither reason nor authority could guide its course. The prohibition of women from undertaking the journey was passed over in contemptuous silence. They separated themselves from their husbands where men wanted faith, or resolved to follow them with their helpless infants. Monks, not waiting for the permission of their superiors, threw aside their black mourning gowns, and issued from their cloisters full of the spirit of holy warriors. A stamp of virtue was fixed upon every one who embraced the cause; and many were urged to the semblance of religion by shame, reproach, and fashion. . . .

They who had been visited by criminal justice were permitted to expiate in the service of God their sins against the world. The pretence of debtors was admitted, that the calls of heaven were of greater obligation than any claims of man. Murderers, adulterers, robbers, and pirates, quitted their iniquitous pursuits, and declared that they would wash away their sins in the blood of the infidels. In short, thousands and millions of armed saints and sinners ranged themselves to fight the battles of the Lord. *All nations were enveloped in the whirlwind of superstition.*" Such is the historic picture of the men who prepared to do battle for "the

Prince of peace!" War, when employed in the holiest cause of self-defence, and carried on by disciplined troops, is ever cold and cruel; but, when instigated by revenge or aggression, and committed to the hands of a rude and savage rabble, it will perpetrate the blackest crimes against God and man, with unblushed impudence and unrelenting heart. It was thus with the Crusaders. Our time would fail to tell their cruel deeds, and our space prove insufficient to chronicle their wild excesses. Our readers, too, would sicken as they

"Looked to see

The blind and bloody soldier, with foul hand,
Defile the locks of the shrill-shrieking daughters;
The fathers taken by the silver beards,
And their most reverent heads dash'd to the walls;
The naked infants spitted upon pikes;
Wiles the mad mothers, with their howls confus'd,
Did break the clouds."

All these scenes the Crusades presented; and hell, we think, must have looked on with savage delight to observe that men with the symbol of the cross upon their shoulders could perpetrate, in the name of religion, deeds as foul as would have been done had the infernal gates opened to let forth upon earth a host of incarnate demons! But, according to Guizot, "*the Crusades unfolded a Christian Europe!*" Darkness, in future, may pass for light, and truth for error, or we must adjudge the author of this sentence as ignorant of the true character of the Crusades as of Christianity itself.

The question now comes, Were the effects of the Crusades—thus conceived in error, fostered by superstition, and carried out by crime—favourable to the civilization and moral elevation of the people? C. W., Jun., and many others, reply in the affirmative, although we were inclined to answer, *a priori*, in the negative, and subsequent research shows, we think, the truthfulness of such an opinion. We have carefully examined our friend's long string of authorities, in expectation of discovering some conclusive arguments in favour of the position that he has taken; but in this we have utterly failed. The list of writers quoted certainly presents a formidable front; but an array of names and opinions will not strike awe in a thoughtful mind, for he will regard mere authority in matters of belief as possessed of very little convincing power.

The "holy" excursions are said to have

had a very beneficial effect upon the minds of the men who engaged in them, as they widened the range of their observation, and opened up fresh sources of knowledge. But, remembering the circumstances under which the crusaders went forth, the nature of the scenes which they witnessed, and knowing that it is only a "brute, unconscious gaze" that ignorance casts around it, we are not prepared to admit that any mental elevation proceeded from these exploits of moral depravity. If it had been otherwise, and the minds of the multitude had received the full benefit of foreign travel in oriental lands, how few of them would have returned to impart the improvement to others! It is an undisputed matter of history, that the corpses of upwards of three millions of Europeans either fell in the battle-field, or their bones were left bleaching on the desert's sands. Yet it is still urged that those who did return brought with them most precious products. To this we would reply, in the words of another, "If it be still insisted that some benefits in domestic, civil, or scientific knowledge were necessarily communicated to Europe, either by the expeditions themselves, or, at least, owing to our long abode in the East, I ask what those benefits were? or how it happens that the literary and intellectual aspect of Europe exhibited no striking changes till other causes, wholly unconnected with the Crusades, were brought into action? I believe, then, that these expeditions were *utterly sterile with respect to the arts, to learning, and to every moral advantage.*"*

It is urged that the condition of the people was improved, and civil liberty promoted, by the Crusades. Much treasure, and blood more valuable, were wasted; but this affected all classes of the community alike: the prince and the peasant might move, but they preserved their relative distances. "The papal authority for a crusade acted as an act of temporary enfranchisement of every description of slaves; but *such of them as returned from the holy wars resumed, of course, their old occupations; consequently, Europe gained nothing by the matter.*"

But it is said that, "by means of these joint enterprises, the European nations became more connected with each other," and

"a moral unity amongst the nations broke forth." Where is the proof of the correctness of these assertions, and to which page of European history will our friends turn for illustration? We wait to learn.

It will be asked with confidence, did not a great advance in civilization follow the Crusades? Not immediately, and not as a matter of consequence. It was not till the fifteenth and sixteenth centuries that any great movement took place, and this period embraces the following thought-awakening events:—1st. The revival of classical learning, including the diffusion of a knowledge of the language and spirit of ancient authors. 2ndly. The invention of printing; before which it might be truly said of the people,

"That knowledge to *their* eyes her ample page,
Rich with the spoils of time, did ne'er unroll."

3rdly. The discovery of a passage to the East Indies by the Cape of Good Hope, which so deeply interested the public mind. 4thly. The discovery of America, which opened up a new world of unknown richness and extent to European enterprise. 5thly. The rise and progress of the Reformation, by which the whole surface of civilized society was moved, and the mind of every thoughtful man was agitated. The sharp disputings of the adherents of the rival systems developed the moral and mental faculties of mind. At length the Catholics, finding reason fail them, resorted to arms, and then began that fierce and protracted struggle, which terminated in the establishment of the freedom of thought in every Protestant land. It is, we conceive, to these events, and events like these, that the progress of modern Europe is to be traced, rather than to the excesses of the crusaders.

But our space is well nigh spent, and we cannot do better than cite, in conclusion, the testimony of Mill, who says, "The spirit of crusading, composed as it was of superstition and military ardour, was hostile to the advancement of knowledge and liberty, and, consequently, no improvement in the civil condition of the kingdoms of the West would have been the legitimate issue of the principles of the holy wars. * * * The Crusades retarded the march of civilization, thickened the clouds of ignorance and superstition, and encouraged intolerance, cruelty, and fierceness. Religion lost its mildness

* "Literary History of the Middle Ages."

and charity, and war its mitigating qualities of honour and courtesy. Such were the bitter fruits of the holy wars! Painful is a retrospect of the consequences, but interesting are the historical details of the heroic and fanatical achievements of our ancestors. * * * Nature recoils with horror from their cruelties, and with shame from their habitual folly and senselessness. Comparing the object with the cost, the gain proposed

with the certain peril, we call the attempt the extremest idea of madness, and wonder that the western world should for two hundred years pour forth its blood and treasure in chase of a phantom. * * * We feel no sorrow at the final doom of the Crusades, because in its origin the war was iniquitous and unjust."* J. M. S.

Politics.

OUGHT NATIVE PRODUCE AND INDUSTRY TO BE PROTECTED BY LEGISLATIVE ENACTMENTS?

NEGATIVE ARTICLE.—I.

"It were to be wished that commerce were as free between all the nations in the world as between the several counties of England. So would all, by mutual communication, obtain more enjoyment. *Those counties do not ruin each other by trade; neither would the nations. No nation was ever ruined by trade, even seemingly the most disadvantageous.*"—DR. FRANKLIN.

THE words we have just quoted were written by a philosopher, and not by a professed political economist: they are, however, alike worthy of either, for they embody at once a wise precept, and furnish a most apt illustration of its truthfulness. We should wish to treat the subject in the same philosophic light as Franklin did, viewing it upon its broadest basis, and illustrating it by the most simple truths and examples which it may be in our power to produce.

We say, with Franklin, it is to be wished that commerce was as free between the nations of the world as between the counties of England. We shall endeavour to show why it *should be so*, and the evil consequences which have resulted, and which are resulting, from the existence of an opposite state of things.

"There are," says Porter, in his "Progress of the Nation," "but few countries so circumstanced, with regard to their natural capabilities of soil and climate, as to be independent of all other countries for the supply of many of those productions which have become necessary to their comfort, if, indeed, they be not indispensable requisites to the

well-being of their inhabitants." This is the highest modern English authority we can produce. We may also quote the next sentence, as it may be useful to us during the debate:—"England is, assuredly, not one of those countries, and foreign commerce is to its inhabitants a thing of social, if not of physical, necessity." We turn, next, to the greatest French authority, M. Say, and we find him declaring that "a government which absolutely prohibits the importation of certain foreign goods establishes a monopoly in favour of those who produce such commodities at home AGAINST those who consume them; in other words, those at home who produce them, having the exclusive privilege of selling them, may elevate their price above the natural price; and the consumers at home, not being able to obtain them elsewhere, are obliged to purchase them at a higher price." Further, we find it asserted by Adam Smith, that "Taxes imposed with a view to prevent, or even to diminish, importation, are evidently as destructive of the revenue of the customs as of the freedom of trade." We have, therefore, some tangible ground upon which to enter into the inquiry.

Now, as scarcely any country contains in itself all the natural productions for the physical necessities and enjoyments of its inhabitants, it may be fairly presumed that it was part of the design of Providence that commercial relations should spring up between

neighbouring and distant nations, for the purpose of supplying the different wants of each. Any other hypothesis would imply that mankind were *not intended to pursue the full means of physical enjoyment*, which is so contrary to the evidence of our own senses, as scarcely, we presume, to gain a moment's credence. Any legislative enactment, therefore, having a tendency to restrict this free interchange of commodities, must be directly at variance with the beneficent design of Providence, which was, no doubt, ordered as a means of promoting unity and concord, by showing to each nation how much it was dependent upon others for the advantages it enjoyed. The love of war, and other depraved passions of the human heart, have, however, set nations so much at variance with each other, that in many cases this design has been entirely lost sight of; while in other cases the debts entailed in the prosecution of such wars and disagreements have been so great as to render it almost incumbent upon such nations to create a monopoly of some sort in favour of themselves, in order to meet their great liabilities. In either case a wrong is committed.

Again:—The prohibitive restriction of *importation* creates a monopoly in favour of the producer, and hence against the consumer. This truth is obvious. Take an example in point. France is a warmer country than England, and can produce a greater quantity of silk in the raw state than England, and at a cheaper rate; England, however, has a more inexhaustible supply of iron than France, and has greater facilities for working it up by reason of its supply of coal and steam power. But England thinks proper to restrict the importation of silk from France by imposing a heavy duty: the consequence is, that just to the amount of the duty imposed is the English silk producer *protected at the expense of the English consumer*; because, had there been no duty, the consumer would have had his silk at the French cost of production, and not at the greater English cost. In the same way, if France imposed a duty upon the importation of English iron (we believe she has not yet been foolish enough to do so), would the purchasers of iron in France have to pay its *artificial* instead of its *actual* value, *i. e.* the cost of producing and shipping it. Both countries, therefore, suffer; first, by having

their commercial transactions crippled by the restrictions imposed; and, next, by the consumer having to pay an artificial instead of the real value of the commodity he requires.

Then there comes the plea that the *revenue* "must be raised." Of course it must, and a large proportion of it out of trade and manufactures. But is there only *one* way of raising a revenue, and is that way necessarily detrimental to that class who contribute most largely to it? Is a man a gainer in any form who escapes a *direct* impost, amounting, say, to thirty per cent. upon his income, but pays *several indirect* ones, amounting together, at the least, to fifty per cent.? This is what actually occurs to every one in a country where the revenue is raised upon importations of foreign commodities; or, in other words, where native industry is protected by legislative enactments. We contend, in the face of every argument we have yet seen adduced to the contrary, that the inhabitants of a country commercially free in every sense of the word would be better able, as a body, to pay any reasonable amount of taxation than they possibly can under a restrictive system, however devised, and that, in such case, the burden of the revenue would fall more equitably and justly.

After these general observations let us look at the matter still more in detail.

Unrestricted commerce has a tendency to promote manufactures, and cover the earth with industry. Restrictions, in whatever form they appear, deaden the commercial spirit, and confine trade to particular spots. This is not a principle of our own suggesting; it is a truth which has been recognised well nigh as far back as English history carries us. In Magna Charta there was inserted a clause to the effect "that all merchants should have safe and sure conduct to come into England and to depart from it, and to buy and sell without the obstruction of evil tolls." Several acts of parliament were also subsequently passed confirming this privilege; and we have the authority of Lord Coke (referring to the clause in the charter and the acts of parliament following it), "That all monopolies concerning trade and traffic are *against the liberty and freedom granted by the great charter*, and divers other acts of parliament which are good com-

mentaries upon that charter." It would have been well for England, and, indeed, for the whole world, had the rights of the people, and the true spirit of the British constitution, been as carefully watched and defended at subsequent periods as at the obtainment of the charter. But when British princes began to think more of foreign conquests than of the prosperity of their subjects at home, and when, in order to meet the great expenses incurred by their foreign defeats and conquests, extraordinary grants were required to be raised, it was then that constitutional rights were lost sight of, and commerce became fettered with every description of impost human ingenuity could devise. This was the primary step; but the evil did not rest here. As the wants of kings became more urgent they had recourse to the merchants for loans, and these merchants were too often instrumental in causing restrictions to be imposed upon the importations from foreign countries, in order to promote the sale of their own commodities, at a higher rate of profit, at home. This is an historical truth; and by it we learn *how* false principles and practices usurp true and just ones, and in process of time become defended and justified.

Again, protected manufactures have almost always been found in a languishing state. The woollen, the cotton, and the silk manufactures in England all afford striking examples of this truth. The woollen trade, perhaps, affords us the best example, on account of the almost unheard-of extent to which the attempts to protect it were carried. In the year 1678, an act was passed for the encouragement of the English woollen manufacture, in which it was ordered that *all dead bodies* should be wrapped in woollen shrouds! and, but a little later, finding that the woollen manufacture was making some progress in Ireland, the English manufacturers petitioned the king (William III.) and his parliament to interfere for its suppression in that country. Nor was their supplication unheeded; for in the king's answer to their address, he made the following promise:—"I shall do all that in me lies to discourage the woollen manufacture in Ireland, and encourage the linen manufacture, and to promote the trade of England;" and an act very soon *did* pass to that purport. Here, then, was legislative pro-

tection with a vengeance. But what came of it? The woollen manufacture remained protected until 1825. In the five years, from 1820 to 1824, our exportation of woollen goods amounted to 1,064,441 pieces. In the five years, from 1840 to 1844, it reached 2,128,212 pieces, or just double the quantity exported during the last five years of prohibition; and this, too, in the face of a rapidly increasing trade in cotton! What will our Protectionist friends say to these figures? But why need we even go so far back as the history of the woollen trade for an example? We have a still more powerful illustration in the case of agriculture. Up to within the last few years British agriculture was protected by an import duty upon foreign corn. And what was the consequence? Just what we might expect. Prices were high, and the *less corn there was produced the higher the prices rose*. This was virtually a premium for bad farming, and so it operated. Nowhere were the resources of the land properly or fully developed. Want of skill and energy was everywhere prevalent among agriculturists, until their supineness became proverbial; and what the upshot of another century's persistence in such a course, none can describe and but few imagine, except those who so nobly came forward, and, amidst the "mingled jeers and laughter" of the *few*, averted the impending evil, and laid the foundation of peace and plenty for the *many*.

"Mind is mightier than the strong,
Right *hath* triumphed over wrong."

We know that the question of free trade in corn is a sore one in many quarters. We do not wish to wield the last too heavily. Landlords complain loudly of the wrongs they have suffered. Their rent-roll has become reduced, and the value of the fee simple of the land has been lessened. This is undoubtedly true. As ever, so now, "after the crisis comes the crash." Land and its produce had been raised to an artificial value, and that, too, at the expense of the necessities of the people: thus the people had suffered at the hands of the landowners. But retributive justice came, and many of the mighty were put down, while the humble have been exalted. Well might poor Hood exclaim, in days gone by—

"O God! that bread should be so dear,
And flesh and blood so cheap!"

Long ago did that most truthful of poets, Ötver Goldsmith, tell us—

"Ill fares the land, to hastening woea prey,
Where wealth accumulates, and men decay."

But in the all-absorbing scramble for wealth, the cries of humanity were long overlooked.

We are prepared to show that the tendency of protection is to destroy *external trade*; also to uphold the advantages of all commodities being rendered as *cheap* as is consistent with their cost of production, without their being encumbered with taxation; and finally to maintain that *free importation* is the source of plenty, and protection the forerunner of scarcity; but space reminds us that it, too, must not be over-taxed, and we therefore hasten to a conclusion.

We cannot but rejoice in the fact of a steady determination having set in, to rid commerce of its fetters, and leave it open to the only legitimate *protection* we have learnt to recognise, namely, *the protection of its own intrinsic superiority and worth*. If British manufactures are more durable, and not necessarily more costly, than those of other countries, they will, of course, take pre-eminence. If British commerce generally be more advantageous and accessible than that of other countries, then it also will still maintain the superiority. But if it be

otherwise, then let the country which excels Britain in these particulars derive the advantage of her excellence. *The world must gain by every improvement in production, or increased facility in exchange*; but it is neither desirable nor just that any nations or people should, by any possible means, usurp the laurels or the bounty, to which in the "great race of nations" now going on, they do not show themselves to be honourably entitled to receive.

Glancing at the alterations which have, within the last few years, taken place in the tariff of the several countries of continental Europe, we perceive most assuredly a "move in the right direction." To this we may refer more particularly in another paper. Looking at the opinions recently expressed in high quarters in England, we feel assured that the tide of free trade has set in, and that before it every legislative restriction to commerce must be entirely and for ever abolished. This is not an age for retrogression.

Looking at the question in its broadest aspect, we are prepared to maintain that native industry *ought not to be, and need not be, protected* by legislative enactment; and this opinion we shall hold, until proof be adduced to the contrary. C. W., Jun.

AFFIRMATIVE ARTICLE.—I.

It forms a curious yet interesting task to compare Britain, as now presented to our view, with its position and capabilities in gone-by ages. It has evidently been ordained by God that civilization can only be gradually etched from barbarity; and while we see some nations high in intellectual progress and moral greatness, others are sunk in ignorance, and debased by vice. But, strange to say, we have instances of the glory of the first departing, while the shame of the latter has been taken away. Need we cite the case of Palestine, which was once the delight of the Lord, and which, from the influence of His favour, attained the loftiest eminence in religious privileges and moral greatness? But, when basking under the influence of the smiles of heaven, a sad and desolating blight came over the whole land, and now "its holy cities are a wilderness, Zion is a wilderness, Jerusalem is a desolation," &c. Speak we of Rome, "the mistress of the world," and

tell of her conquests and universal rule? Then we must dwell on her decay, and finish with her fall. Or, if to Greece we turn our retrospective glance—to Greece, "mother of arts and eloquence," the land of philosophers and the home of sages—we involuntarily recur to her present aspect, and sigh over the sad change which has come over her, feeling

"'Tis Greece—but living Greece no more!
So coldly sweet, so deadly fair,
We start, for soul is wanting there!"

Without staying to inquire into the causes that sapped the foundations of these great empires, let us see in what state our own land must then have been. From what we can gather from the historian, Britain must have been barren and unfruitful in the extreme. It occupied its place as a dark spot on the face of the deep. Again, as we look down the long vista of time, we behold mighty changes passing over its surface, which cannot be better described than in the language of the

inspired penman, when he speaks of the wilderness and the solitary place being glad, and the desert blossoming as the rose. The character of Britain has indeed changed; barrenness has yielded to verdure, and weakness been supplanted by strength.

The question then comes, What is the cause of this prosperity? And we conceive that the answer will lead us to adopt the affirmative view of this question. We depend much upon agriculture for our prosperity, but it is evident that if this had been the only foundation for our greatness we should have been very different to what we now are. The principal cause of our present proud position was the industry and inquiring spirit of the people. After the treasures of the mineral world had been discovered, intellect began that noble course which, in its upward range, has brought us where we now are. It is a remarkable fact, that when our land was found of a peculiar internal construction, embodying a wonderful combination of the most useful minerals, then the people became famed for their untiring toil; the mind was called into operation; practice soon gave birth to theories; and, after a series of careful experiments, mighty results were realized. Invention had only to lift her wand and mutter her incantations, and a thousand varied forms and strange combinations sprung into existence. The invention of the steam-engine marks an era in the progress of Britain, and as its immense power was further developed, its multifarious applicability became manifest. And now, behold the result! Where is there a nation that presents such a scene as ours?—a scene where mechanical forces and appliances, in their most striking forms, are displayed—a scene in which manufacture takes a sovereign place, in which trades are carried on with such perfect system. Upon these things, as well as upon natural produce, not only our greatness, but our very existence as a people depends; and therefore they ought to be protected—protected by such means as will prove most efficient; and these must necessarily be legislative enactments. This is a great and important question, and as such deserves our close attention. Were the glorious fruits of our industry exposed to the gaze of the world without a legislative fence encircling them, we should soon be robbed by the unhallowed grasp of the stranger, or

the unprincipled fellow-countryman. Yes, to preserve native industry, to keep it in a healthy and energetic state, legislative enactments must be made. These have the happy influences of preventing the foreigner from culling our inventive ideas, and of making self-dependence flow in its own proper channel; for self-dependence will keep one countryman from living on another's toil. For this purpose—to take a case in point—we believe patents were first instituted; and these have at least the tendency, if not the direct power, of giving to each man his due. When a man invents a machine, it is his undoubted right to claim the protection of his government; and were this not the case, that happy dependence referred to, which man places upon his own energy and skill, would be sadly weakened; rights would be violated, and injustice committed.

Here, then, we have a form of protection, the propriety of which even our opponents will admit; and we maintain that the principle involved in it may be advantageously applied to other cases. We do not advocate the abstract principle of protection as of universal applicability; but we maintain that it may be properly and beneficially applied, at certain stages, in a nation's progress, and especially towards certain crafts and classes in a community. Even Adam Smith, who lays down as the first principle of the wealth of nations that, "as far as mere wealth is concerned, the fewer restrictions on industry the better," admits that there are two cases in which it may be advantageous to lay some burden upon foreign, for the benefit of domestic, industry. The first, "*when some particular sort of industry is necessary for the defence of the country*." The second, "*when some tax is imposed at home upon the produce of domestic industry*."

It has been well said by the ex-premier (Lord John Russell):—"Were there no such thing as war, no such thing as commercial disputes, no such thing as a national debt, it might be easy for the ministers of different communities to come to an understanding upon a plan of general freedom, and regulate the world according to the rules of universal liberty. But the existing fact is, that every nation is obliged to guard its independence with the utmost jealousy; to avoid with the greatest care putting itself under the control

f any other power; and to check its industry by taxes, which are absolutely necessary for the preservation of its separate existence. . . . It is not only internal but external situation, also, that must be consulted in arranging economical laws for a nation. In deciding every question that comes before him, a legislator ought to consider that he has to provide, not for the execution of a project of perpetual peace, but for the welfare and prosperity of his own country.

Without going the length of a Venetian proverb, '*Pria Veneziani, poi Christiani*,' I am disposed to say, '*Let us first be Englishmen, then economists*.'

Considering these things, and, above all, the fact that under a faulty system of protection Britain has become "great, glorious, and free," we give, with confidence, an affirmative reply to the question now under debate.

A.

Social Economy.

IS THE CONFESSORIAL IN HARMONY WITH INTELLECTUAL AND MORAL FREEDOM OR SOCIAL WELL-BEING?

NEGATIVE ARTICLE.—III.

THE nature of the confessional is a point on which many are grievously ignorant, although it is so important. If auricular confession be enjoined by God *as necessary to salvation*, how many there are who, by denying it, forfeit his mercy; but, if it be not, what must be thought of a church which sets up such a doctrine in defiance of his holy word, and in direct breach of his command "not to add to or diminish" from it? When, too, we consider the training of a priest for the confessional, we wonder not when even St. Liguori cries, "Oh! how many confessors have lost their own souls and those of their penitents!"

Of "Aristides'" article we say nothing; his arguments are clear, and, to an impartial mind, convincing; but we purpose examining those of "Confessarius," not in party feeling, but with an unbiassed mind, whose only desire is to elicit truth.

"Confessarius," then, commences with this argument:—"No institution sanctioned by God can be opposed to the true welfare of man." Auricular confession is an institution sanctioned by God; therefore, auricular confession is not opposed to the true welfare of man. Now, the major premise we reluctantly admit, but the minor we unequivocally deny. We may at once grant that confession of sins has that sanction which the first two texts adduced affirm; but, happily, they have nothing to do with the point

at issue. No word about *secret confession to the priest* is here used. The people *confessed* their sins to God in public, not to the priest in private. These two passages, then, prove nothing for "Confessarius." His whole argument hinges on the word "confess," the correct meaning of which he will find by comparing Numb. v. 6; Lev. v. 65; xxvi. 40, "If they (the Israelites) shall *confess their iniquity* . . . then will I remember my covenant." Josh. vii. 19, where Joshua exhorts Achan to give "glory to God, and make *confession unto him*." 1 Kings viii. 33, 35, 47; Nehem. ix. 2, "And the seed of Israel . . . stood and *confessed their sins*." Psa. xxxii. 1—5, "I will *confess my transgressions unto the Lord*." Dan. ix. 3, 4, "And I prayed unto the Lord my God, and *made my confession*." Ezra x. 1; 2 Chron. xxx. 22; Rom. x. 9, 10; 1 John x. 8, 9; *cum multis aliis*. Thus we see that, although God enjoins confession of sins, yet that it means not secret confession to the priest, whereby may be obtained absolution, but a humble acknowledgment of our manifold iniquities to Himself, the great Fountain Head, who alone is able to pardon them.

"Confessarius" next brings forward that oft-quoted passage by St. James, ch. v. 16, "Confess your faults one to another, and pray one for another, that ye may be healed. The effectual fervent prayer of a righteous man availeth much." This bears on the face

of it something very different from auricular confession. The meaning of the text is plain and obvious, and is explained fully by our Lord Jesus Christ in the sermon on the mount, Matt. v. 23, 24, if any one has injured another, let him go *confess it to him*, and then let him come and offer his gift. Lastly, he quotes that beautiful passage in St. John's 1st Epistle, i. 8, 9, "If we say that we have no sin, we deceive ourselves, and the truth is not in us. If we confess our sins, God is faithful and just to forgive us our sins, and to cleanse us from all unrighteousness." This, by a mysterious course of reasoning, he tries to make conclusive. He says, "Private confession to God alone cannot be meant for two strong reasons; first, because the confessing our sins is here put in opposition to the saying we have no sin: these two are opposite to one another, and therefore must certainly relate to the same object. Now, who is there in his senses who would dare to say to God, in private, that he has no sin? In this part of the sentence, then, the apostle certainly means saying, we have no sin before men; and, consequently, in the opposite part of it, when he says, 'If we confess our sins,' he necessarily means before men also." We grieve deeply at such wresting of God's word. Weak must be the authority for a doctrine, if proofs such as these are required. Alas! people, instead of taking their religion from the Bible, make a creed of their own, and then go to the Bible for proofs. "If we say we have no sin, we deceive *ourselves*," not *others*, as it must be, were the reading of "Confessarins" correct. No. If sin has hardened our heart, so that we say in it we have no sin; or if, conscientiously believing ourselves pure, we repeat our conviction to others, then "we deceive ourselves, and the truth is not in us;" but if humbly we acknowledge our iniquities, and confess our manifold sins unto God, then "He is faithful and just to forgive us our sins, and to cleanse us from all unrighteousness."

We think, then, we have satisfactorily shown that the Roman Catholic Church is utterly destitute of scriptural authority for her doctrine of auricular confession; and it now remains for us to endeavour to prove it a novel doctrine, without exhibiting any great "ignorance of history," or "wilful misinterpretation of it."

"There is no doubt that, in the early days

of Christianity, public confession and penance for open and scandalous crimes were in use, and were observed with much strictness. But we do not find traces of any general law, or even custom, that called for the secret confession of sins to the priest, as a necessary part of repentance, and a condition of forgiveness. When this ancient discipline fell into disuse, it was at length succeeded by private confession to a priest particularly appointed to the office, and called the *penitentiary*; but, upon the occasion of a scandal which happened, the practice was abrogated by Nectarius, bishop of Constantinople, which plainly proves that, in the judgment of the church, it was not regarded as a sacramental act." This their own canon law proves, which states, "It was *taken up* only by a *certain tradition* of the church, and *not* by any *authority of the Old and New Testaments*."* Panormitan says, "he finds no manifest authority that ever God or Christ commanded us to confess our sins to a priest."† And Peresus, a bishop of the Trent Council, declares, that "the clear and plain manner of this ordinance, both in respect of the substance and circumstance, *appears only by tradition*."‡. Petrus Oxoniensis, too, affirms, that "it had the beginning from a positive law of the church, and not from the law of God."§ The Romish St. Breveture|| held this, as well as Medira** Rhenanus†† and Erasmus‡‡ affirm, that "neither Christ ordained it, nor the ancient church used it." Hear Caietan:—"A man contrite or sorrowful for his sin standeth clean in the judgment of God, and is a formed member of the militant church."§§ Hence contrition, as it goes before confession, so may be without it. Lastly, St. Chrysostom says, "This is wonderful in God, that he not only forgives us our sins, but neither doth he disclose them nor make them known, neither does he enforce us to come forth and tell

them. *He requires no more but that we speak to him alone, and to him alone confess our faults.*"* For many years the matter rested in this state, and, until the year 1215, no effort was made by the church to establish it; then, at the fourth council of Lateran, a decree was passed concerning it. At the Council of Florence it was again considered, and at the noted Council of Trent it received the form it now bears, which is as follows:—

"The universal church has always understood that an entire confession of sins was ordained by Christ, and that it is of divine right, necessary to be observed by all who have fallen into sin after baptism; for our Lord Jesus Christ, being taken from earth to heaven, left his priests as his vicars, to be judges and presidents, before whom the faithful should bring all the mortal sins into which they have fallen, to the end that, using the power of the keys committed to them for the remission or retaining of sins, they pronounce sentence; as it is manifest that the priests could not exercise this jurisdiction without knowledge of the causes of sin, or maintain equity in the infliction of penances, if penitents should confess their sins only in general and not in detail, it follows that they ought to disclose and enumerate all the mortal sins with which they are conscious they are chargeable, even the most secret of their transgressions; and not only the sins themselves, but all the circumstances which gave a particular complexion to them." We find, then, that although for many years the wholesome custom of penance may have been gradually changing, yet as, until 1215, no official recognition of auricular confession took place, we cannot date it from an earlier period.

Now, what is the nature of the confessional? We read that it is a part of the Romish sacrament of penance, which is instituted "for the remission of sins after baptism," and "is as necessary as baptism." In the "Real Principles of Catholics" we read, "What is sacramental confession?—Answer. It is an accusation of our sins to a proper priest, &c., in order to receive absolution.—Question. Is it a great sin to conceal, through shame or fear, any mortal sin in confession?—Answer. Yes, it is a grievous sin, because it is *lying to the Holy*

Ghost." Thus every conscientious Romanist believes that, without absolution, all who fall into mortal sin after baptism *cannot* be saved; whilst to omit any mortal sin in confession, from whatever reason, is regarded as a mortal sin, and invalidates the sacrament of penance.

The influence, then, of the confessional must be most powerful. It is a net, cunningly woven, to ensnare the minds of men through their superstition. Is it employed for good or evil? The answer is to be found in its history and practice. However it may vary in unimportant particulars with different nations, yet its vital principle is the same—the animating principle of Popery—absolute power. Though confession is only absolutely commanded twice a year, yet its constant use is not forbidden. Hence the credulous or the morbid minded will be frequently using the—to them—comfortable sacrament of penance. The priest, too, in the confessional, stands as a judge; the penitents as criminals. Hence every evil thought—every unholy action—every carnal desire—all the hidden secrets of the heart—must be laid bare to him before absolution can be received. Think what power he has—gentle or harsh, consoling or denouncing, strengthening or terrifying, knowing how to discover that human depravity we would in vain conceal; *all* his questions *must* be answered by the wretched penitent, for without this absolution is refused, and without absolution—damnation. Secrecy is promised. "Only God knows it; then why hesitate?" How awful a power to place in the hands of flesh and blood—no angel, but one subject to all the unholy wishes he demands an account of from the penitent. "*I* the Lord search the heart; *I* try the reins." And shall any fallen man presume to exercise God's prerogative? Can this be consistent with moral freedom? No! not moral freedom, but moral slavery. Is it consistent with social well-being? Peruse the casuistical works of Liguori and others. We have said confession is made under the vow of secrecy. The confessor knows as God's servant, not as man. Should murder, treason, or any fiendish crime be intended, and revealed in the confessional, he could not divulge it, not even to save the life of one victim. Thus, all the evidence necessary to convict an atrocious criminal may lie within the reach of the priest, and yet the

* Hom. 22, ad Pop. Antioch.

offender against God and man escape, only to commit greater crimes and heap up more damnation. Still there are cases where disclosures may be made, and yet not infringe the oath of secrecy. Out of many such we will cite one. Liguori says, "Out of confession, with the permission of the penitent, it is possible to act concerning things heard in confession, either with the principal or any one else, although it is dangerous." "He that confesses may so act that what the priest knew . . . as God he may also know as man; which he does when he gives him permission to speak concerning it; and, moreover, if he speaks he does not break the seal."* Is this, too, consistent with social well-being? What fearful schemes may be contrived between the priest and penitent (?) for the harm of innocent persons, who can have no guard against them!

And will any one declare that such a practice is christian? It is a dangerous pitfall. It is a deadly poison, for which

Protestantism is the only antidote. It blunts the edge of conscience, and stupifies the moral sense. Instead of leading to God, it kills the soul. Were this a place to enter into detail upon the bulls of Pius IV. or Gregory XV. for "repressing the abominations of the confessional," none would marvel at the disgust and horror every true Protestant feels towards it. Its casuistry—its seal of secrecy—the subjects touched on—all prove that the confessional is detrimental to the morals of the confessor and penitent. Can it stand the test of Leviticus v. 1? "And if a soul sin, and hear the voice of swearing, and is a witness, whether he hath seen or known of it; IF HE DO NOT UTTER IT, THEN HE SHALL BEAR HIS INIQUITY." Alas! no. No one can thoroughly examine it without sorrowfully feeling that its origin is unscriptural, and that it is utterly at variance with intellectual and moral freedom and social well-being.

C. C. F.

AFFIRMATIVE ARTICLE.—III.

THE impressions which we form of any object depend very much upon the position which we occupy and upon the medium through which we view it. A foggy atmosphere envelops everything with gloom, and changes the appearance of the very orb of day. It is so with moral and spiritual subjects; our own prejudices and antipathies obscure the plainest truths, and give repulsiveness to the most beneficial practices. When, therefore, we have formed an unfavourable opinion on any subject, we ought to inquire whether that opinion has been produced by the antagonism of the subject to our feelings or to our perceptions of verity and virtue. It would be well for the opponents of the confessional to do this, and not to come to the discussion under the influence of all their blinding anti-Catholic prejudices.

This train of thought has been occasioned by W. G.'s negative article in the last number of this magazine. He there indulges in a long tirade against the Catholic Church, the claims and character of which are not now the subject of dispute; and then expatiates on the right of exercising reason—a right tacitly admitted by all taking part in this

debate. While professing to be the friend of Reason, he bribes Passion to lead her astray! "Alas, poor Yorick!"

We cannot help contrasting with this the tone in which the affirmative articles are written. Both "Confessarius" and J. B. very properly and calmly view the question apart from its connexion with any particular church. And thus, we conceive, it ought to be viewed; for the confessional is not exclusively a Catholic institution, for there is at the present day, notwithstanding "Aristides" may be ignorant of the fact (*vide* 1st par. Neg. Art. I.), a large and increasing body of clergymen and laity in the Church of England very properly insisting on the importance of auricular confession.

Having made these observations on the spirit of our opponents, we may offer a few hints on the arguments they have brought forward. They attempt to prove that the confessional is not in harmony with mental and moral freedom by asserting that it induces "servility of mind," detracts from our "common manhood," and takes away "the moral jurisdiction" of conscience. And here we would ask, Might not these objections be urged against the restraints of every moral precept and every civil ordinance? For all

* See, also, D. Thom. in Supple. 9, 11, a 4.

these are opposed to man's individualism in thought and action, when that thought and action are contrary to the laws of God and man. If man was now, as once, a perfect being, he would require no restraining nor restoring influences. But, alas! he has fallen from his high estate, and needs external agencies to bring him back and keep him right. His "mind" is strong, but it is apt to run astray; his "manhood" is noble, yet it is defaced; and his "conscience" only speaks while her voice is regarded, and then she closes her lips in sullen silence. The confessional is in harmony with man's conscience that "gives evidence against his soul;" it is not antagonistic to his manhood, but to his great enemy, sin; and it is not opposed to mental freedom, when that freedom is not opposed to God. True, it may be contrary to our flesh, and repugnant to our nature, but from this fact a very powerful argument in its favour may be drawn. It has been well said—"The very nature of this duty itself proves it to a demonstration; for, as it is a duty exceedingly contrary to flesh and blood, most humbling to our pride, and most afflicting to self-love, it is plainly impossible that mankind could ever have been induced to practise it as a necessary duty, by any human authority, or indeed by any other means whatsoever, than the full conviction, that God himself required it from them; and this conviction they never could have got, if it had not been introduced into the world with Christianity itself, and flowed from the same divine source with it. Let us suppose, for example, that the Christians of the first ages had no knowledge of this practice, nor believed it necessary to confess their sins; who would ever have dared, in after ages, to introduce so heavy a yoke, or impose such a burden upon the faithful? What opposition must such an attempt have met with? What clamours would have been raised against it? What divisions and dissensions must it not have occasioned? And how would everybody have cried out against it as a novelty, an imposition, a heresy, and what not? It is, therefore, plainly impossible that it ever could have been established in the christian world, but by the command of Almighty God himself. Besides, all monuments of antiquity clearly show, that it has been universally received and practised through the whole christian church, in all countries, and in all

ages; nor is it possible to assign any other beginning to it than that of Christianity itself. Add to all this, the infallible authority of the church of Christ, which always did, and to this day does, hold and teach as a truth revealed by Jesus Christ to his apostles, and by them delivered to their followers, that the duty of confessing our sins in the sacrament of penance is commanded by God himself, and is his express law to all Christians."

With respect to the bearing of the confessional upon morality, many dark insinuations have been thrown out. "Aristides" says that "the Romish clergy, being celibates, not from choice but from compulsion (*though they chose the office knowing that it entailed celibacy*), it is quite apparent that the power which they wield is liable to abuse;" which is tantamount to say, that they are human, while no one denies it. Can our friend point to any kind of power, to any ordinance of religion, or any gift of God, that is not liable to abuse? We think not. Then the only point of inquiry is this—Are those clergymen that possess the influence of the confessional more frequently guilty of moral crimes than others? And we maintain they are not. That such crimes among them do not more frequently reach the public ear than others is a circumstance patent to all; and that they are not more frequently committed, is probable from many reasons; especially from the fact that prudent matrons who have been accustomed to frequent the confessional themselves, have no hesitation or reluctance in sending their own daughters there. Were it otherwise, is it at all probable that these persons would so far forget their womanly feelings as cheerfully to place their beloved children where they knew their virtue would be probably despoiled, and their purity destroyed? We dare trust to any female heart for the reply. Again, it is objected that the books which the priests use, in order to know how to probe the human heart, must necessarily pollute *them*. To this we need only remark, that the same charge might be made, on the same grounds, against medical men who have to study the remedies for secret sins, and to solve the mysteries of midwifery. It is further said, that the questions which are put in the confessional are calculated to pollute the mind: but it is forgotten that these questions are not put indiscrimi-

nately, and only to suspected persons, and that the object is to lead the persons to detest such sins, and to avoid them and their occasions in future. It is better to draw the festering thorn from the flesh, painful as the operation may be, than allow it to remain there, endangering health and life.

In regard to the relation of the confessional to social well-being much has not been said. W. G. makes one or two assertions, the boldness of which is designed to compensate for their lack of truthfulness. "The confessional," he complacently informs us, "tends to the aggravation of crime." Indeed! How so? By breaking down the "universal barrier to crime"—"a fear of indefinite consequences." The indefinite consequences of crime the confessional cannot alter; but, after a full confession and expression of sorrow, it can and does add certain penalties to sin, which must have the effect of rendering it more repulsive. As to the premeditation of crime and the inviolability of the confessional, the following extracts from "A Digest of the Evidence taken before Select Committees of the Two Houses of Parliament, 1824-25,"* may prove illustrative.

THE RIGHT REV. JAMES MAGAURIN, D.D.

"Q. Supposing the priest was made acquainted with an intention to commit murder, in the way of a confession, would he think himself authorized to make any communication upon that subject?

"A. *He would exert himself to prevent the crime being committed; but any communication made to him in confession is inviolable; he cannot divulge it.*

"Q. Supposing it related to a crime not actually perpetrated, but about to be perpetrated; in that case is the communication made inviolable?

"A. If a crime is intended, and if it is made known to him in confession *only*, he cannot divulge it; *he is to use his influence with the individual so far as he can to prevent the crime being committed; but what he hears in the way of confession is inviolable.*"

Here we see that a persuasive influence is brought in *against crime*, entirely through the existence of the confessional; and though its inviolability may appear to mar its usefulness, yet that this is essential to its very existence, is self-evident, and is plainly set

forth in the following extract from the same work:—

REV. J. DOYLE, D.D.

"Q. Would not such a regulation (i. e., as making known the secrets of the confessional) defeat its own purpose, as far as connected with the security of the state, by preventing the habit of confession on those subjects?

"A. Altogether: but by leaving it as it is, the abuse of it is impossible; because when a criminal comes, if he should come, to make known his crime to the priest, the latter endeavours to dissuade him from it, if not perpetrated, and to repair, if it be done, the injury he has committed, as far as it is in his power. *If, however, it were once allowed to the priest to reveal the confession, under any circumstances, no criminal would come to him.*"

Thus we see that the confessional, so far from encouraging crime, is diametrically opposed to it, and established for the very purpose of its suppression: to prove that this effect is produced by it we may, in conclusion, quote the following remarks of an intelligent Protestant, Lord F. Williams:—"No persons in the Catholic communion can approach the holy Eucharist without having confessed all their sins, without distinction or exception, in the tribunal of confession; and no minister can give them permission to approach the holy table, without having first purified themselves with all the necessary dispositions. But these indispensable dispositions are, contrition, the precise and general avowal of all the faults they committed—the expiation of every injustice—the full restitution of everything illegally acquired—the pardon of every injury received—the interruption of every criminal and scandalous connexion—the renunciation of envy, pride, hatred, avarice, ambition, dissimulation, ingratitude—and of every feeling opposed to charity. It is, moreover, at the same time necessary in this tribunal, to give a sacred pledge to God, to henceforth avoid even the most trivial faults, and to strictly accomplish all the sublime laws of the gospel. What securities, what pledges, are not then exacted from each individual, to discharge his social duties—to practise every virtue—integrity, charity, mercy! Here conscience is regulated before the tribunal of God, & before that of the world. Here the criminal is his own accuser, and not his judge; &

* London: T. Cadell, 1826.

while the Christians of other communions, after a partial examination, pronounce in their own cause, and absolve themselves with indulgence, the Catholic Christian is scrupulously examined by another, awaits the sentence of heaven, and sighs after that consoling absolution which is being accorded to him, refused, or deferred, in the name of the Most High God. What an admirable method of establishing among men a mutual confi-

dence—a perfect harmony in the exercise of their respective functions! The authority of the prince cannot degenerate into despotism; nor the liberty of the people into licentiousness. The magistrate, in the administration of justice, must be impartial—the senator, equitable and disinterested—the priest, pure and zealous in his ministrations—the soldier, loyal—the subject, faithful—and the sovereign, just.”
X.

The Societies' Section.

HOW TO STUDY HISTORY.

Try to do it upon some system. Endeavour to group, as it were, into different sections the various parts of what we call history. Have a plan; no one of our English histories will do for you taken alone; not even those of them that are most nearly descriptive of what my views are as to what English history is, would I advise you to read, to the exclusion of the rest. It seems to have been allotted to us as the result of the various conflicts out of which our system in policy and religion has taken its complexion, that history shall be everywhere written, more or less, under a party bias. Well, then, trust to no one implicitly. Compare those that are known to write under different influences, and try to get your impressions from a fair comparison. But that is an extended labour. I have spoken of history as having parts. “Divide and conquer” is the maxim; ascertain what the parts are. There is what is called military history; there is what is called civil history; there is the history of arts and science; there is the history of manufactures. Break up all these into their distinct sections; learn what the history gives you in relation to these civil matters separately; question yourself, when you have read certain portions—“What have I learned from this relative to the great questions of government, the condition of the people, legislation, and how the laws are administered, and manufactures, and commerce, and learning?” Except you do this, my fear is that you may read a large space, and feel that, for want of some plan of this kind, you have not gathered the result that is necessary to the encouragement of your efforts. Now we have histories that are written considerably upon this plan—Hallam’s “History of the Middle Ages,” for instance,—where you have the different parts broken up, each part complete in itself, and all the parts going to constitute the entire of the history. I make these suggestions, having once had some experience as a professor of history, though so obscure were my dealings in that way, that you may not be aware of the fact. I have ascertained how important it is, in order to enable youths to feel that they are making actual progress, that they should proceed upon some such plan.—*Dr. Robert Vaughan.*

EDUCATION; ITS PROVINCE AND ITS INSTRUMENTS.

THE only being capable of Education is man. In the inferior animals, when certain stages of physical development have been accomplished, the animal can perform all the

functions of its kind, and no more. There is no progress, nor improvement. It is not so with man. He is possessed of powers and faculties, which indeed need development, but which are capable of endless improvement. He can avail himself of the experience of his fellows, and of the accumulated experience of past ages, and advance towards perfection.

To develop his powers, to place within his reach all that others have accomplished, to rouse him to vigorous and continued effort in behalf of his own personal improvement, to aid him to form habits which will render him a valuable member of society, and to excite him to employ his energies in behalf of social progress and national welfare; this, and much more than this, lies within the province of Education. In the child there is a temple in ruins, which it is the aim of Education to remodel in all its pristine beauty. In his mind there is the image of Deity defaced, and Education, *as an instrument*, is to be employed to restore it in all its lineaments and fair proportions. Education aims to bring out and train up, in due time and at their proper seasons, all that constitutes man. In its most comprehensive scope it embraces both time and eternity. But as it relates to the schoolroom, it chiefly includes development of powers, formation of habits, and fitness for the discharge of social, relative, and national duties.

Education includes *development*. Man is a being of various powers and faculties, physical and mental. *The man* is allied to a physical nature, through which he receives all his impressions of the external world, and through which alone he acts in his relations with his fellow-men. Again, the mind receiving all its first impressions through the senses, is passive, but it has active powers, such as perception, conception, and judgment, though these powers in the infant are latent, and need to be developed. Again, man has relations to man and to God, and certain duties arising out of those relations; he also possesses the power of discerning the nature of these duties; in other words, he has a moral nature. Here, again, time and circumstances are necessary for these relations to be recognised, and for these duties to be performed. Hence, again, there must be development. Where the physical nature is not defective, the development of some of these mental powers begins at the very dawn of existence. Sensations are produced on the mind by external objects, through the senses, and in a little while the mind begins to associate these sensations with the objects, and then there is perception. And here development is the result of circumstances; but it is not solely attributable to external causes; much of it is owing to the mind's own energy. Yet circumstances have largely to do with the development of the powers and faculties. As far as this development is concerned, we should define education as the art of placing the child in such circumstances, of employing such agencies, and of giving him such exercises as are best adapted to develop his physical, mental, and moral powers.

Education includes *instruction*. It is a common error to confound these. But the one is essentially distinct from the other. If a man make known to me some fact that has come under his observation, he is giving me information; if he make plain to me some proposition in science or art, he is giving me instruction; but if he employ the latter skillfully for the *purpose* of exercising my own faculties, then he is educating me. Instruction is the art of making things plain to the understanding. It is that which throws light over an object, and renders it visible to the eye of the mind. It has the same relation to the mental faculties and the objects of mental culture, that the sun has to the eye and the

external world. As the eye could never revel amongst the beauties of nature, without the presence of light, so the mind could never enjoy the creations of the past without instruction.

Instruction should be employed solely as an instrument of Education. We thus claim for it a higher sphere than that of making man acquainted with the discoveries of science, and the progress of art, or even of fitting him for the discharge of certain employments, which his wants or his social position require at his hands. We ask the educator never to give instruction with these things as his aim. He should never employ instruction for its own sake. We would not have him leave them entirely out of his calculations, but he should hold them in a very subordinate position. We would have the educator never to forget that the child is a being of high powers and destiny—of powers capable of boundless improvements, and with a career of progress that knows no termination.—*Papers for the Schoolmaster.*

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Indee Literary Societies' Union.—First Annual Meeting and Festival.—The first annual meeting of this important association was held in Lamb's Reading Room, Murraygate, on the evening of Thursday, July 20; Mr. John Hunter, vice-president, in the chair. The reports by the treasurer and secretaries showed that the union, notwithstanding the many difficulties contended with, and the public delivery and publishing of a series of lectures, has proved itself to be a successful experiment, so much so that it was resolved to proceed immediately with arrangements for another course during the ensuing winter. The office-bearers for the ensuing year were elected as follows:—Rev. George Gillillan, president; Messrs. John Hunter and William G. Kimmont, vice-presidents; Mr. David Myles, treasurer; and Messrs. Geo. Stewart and Andrew Clow, secretaries. The annual festival of the union was held in Lamb's new hall, in the Temperance Hotel, Reform-street; Thomas Dick, M.D., "the Christian Philosopher," and ex-president of the union, in the chair. About 150 sat down to tea, which was served at tables in a very superior manner. Interesting addresses were delivered by the Chairman on the advantages of such societies, and by Mr. George Robertson on moral music, Mr. George Stewart on the literature of the day, Mr. Walter Brudie on popular manias, Mr. David M. Walker on ambition, and Mr. John Hunter on the language and poetry of astronomy. The intervals were admirably filled up with recitations and music. Altogether, the entertainment was of a high caste, and reflected great credit on all the individual societies of the union, and it would have been a difficult task to decide which of them made the best appearance on the occasion. The utmost harmony and good humour prevailed, and the venerable doctor in the chair, and some veterans clustered near him, were as happy and delighted as the youngest in the hall.

Mechanics' Institute and Mutual Improvement Society, Kidderminster.—The first anniversary of this society was held on Wednesday, September 1, 1852, at the Wesleyan School Rooms, Mount Pleasant. Upwards of fifty members partook of tea. Mr. Samuel Yates, being moved to

the chair, opened the meeting with an appropriate speech, showing the value of such institutions to the youth of Britain. After tea, the officers for the ensuing quarter were balloted for, when a vote of thanks was passed to the late officers. Mr. C. T. Trevis, master of the Old Meeting Day School, in addressing the meeting, stated that he felt a great interest in the cause of "mechanics' institutes," and kindly proffered his services in instructing the members in various branches of education. The meeting duly appreciated this generous offer. The thanks of the meeting being proposed to the ladies who had so kindly consented to preside at the tea-tables on the occasion, a hearty response was the result. Mr. W. S. Roberts, one of the active members, in reply to a call from the chairman, gave a retrospective glance of the society's progress during the first year of its existence. He stated that its originators, about twelve in number, had, by undaunted perseverance and unwearied exertion, increased their numbers to upwards of sixty, and directed them to regard this as an earnest for the future. He trusted that, instead of numbering by tens, they might, at no distant period, count by hundreds, intimating that very great praise was due to the small band that first commenced operations, and that this was an indubitable proof that none should "despise the day of small things." He then portrayed the great benefit to be derived from these institutions in manufacturing towns, especially in consequence of multitudes being sent forth by their parents (in some cases from compulsion, in others merely for the sake of pecuniary gain) to earn their daily bread when they ought to be gaining instruction for the mind in the public seminary, the result of which was, that as they attained to riper years they were prevented from filling situations of respectability and trust for want of mental attainments. The object of these institutions was, in some measure, at least, to provide a remedy for this evil, and thus elevate the working population to a position nearer to the middle and opulent classes. The speaker believed that, while some few might abuse their attainments, the great majority would be morally improved, and shun the places where

vice resorts. Advice was then given with respect to the maintenance of good order in the various departments of the institute, both as regarded the officers and the members, and the necessity of maintaining an upright and consistent character in the daily avocations of life.—Mr. G. Northover then rose and briefly addressed the meeting, bearing testimony to the fact that he, for one, had received intellectual benefit from its operations; and, being a person in middle life, intimated the importance of not merely providing for time, but also for eternity.—The remainder of the evening was enlivened by vocal performances and the reading of selected pieces. At the conclusion, thanks were given to the committee of the Wesleyan schools for allowing the use of the rooms on the occasion.

New Basford Young Men's Mutual Improvement Society.—This society was established, in 1851, by eight persons. The members, now twenty in number, held their first annual meeting on Saturday evening, August 7, 1852. After regaling themselves with an excellent cup of coffee, &c., they elected the officers for the ensuing year; viz. the Rev. J. Wassall, president; Mr. F. C. Brown, secretary; and Mr. J. Yates, treasurer. This society meets every Saturday evening, and is occupied with essays and discussions alternately. It is gratifying to learn that the society is progressing so well. A marked improvement is visible in all who take any interest in its debates. Several of the members feel much indebted to the editors for the valuable instruction derived from the perusal of their magazine.—F. C. B.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

124. Having long felt an earnest desire to study mathematics, both for the sake of their acknowledged utility, and also with a view to an university degree, I wish to have the opinion of some one, competent from previous study to give it, on the following points:—

1. Which is the best method of studying mathematics, the analytic or synthetic? Is it advisable to use the pen much in committing propositions and theorems to memory?

2. Is Goodwin's "Course of Mathematics" a good work, *per se*, to use as a curriculum of mathematical study?

3. Does the study of mathematics injure the health, and may a person of weak constitution give close and exclusive attention to it for a time (say two years) without harm? Is it generally injurious, or otherwise, to the health? How does it, in the end, affect the moral and intellectual character?

4. How many hours a day should a person of ordinary ability study, and what kind of simultaneous reading is best suited to counteract its effects?

To answer all these properly will require, I am aware, a knowledge of mathematics, of physiology, and of mental philosophy, such as few possess; but of those few there will be some, I doubt not, courteous enough to reply to these queries, and oblige—A LOVER OF NATURE.

125. I have understood that the tide-wave which passes by the west coast of Ireland, and afterwards washes the northern coast of Scotland, returns within a few hours down the German Ocean. Would one of your readers be kind enough to inform me in about what latitude the turn takes place, and what are the presumed causes for this apparently backward movement?—A. C.

126. What kind of an examination are druggists required to pass to be members of the Pharmaceutical Society—the knowledge requisite, expenses, &c., and every circumstance connected with it?

Is there any society (or what else it may be

called) for examining in chemistry solely? If so, what is the address—is it a very strict examination—expenses, and all other connected necessities?—W. B.

127. Having devoted some attention to the retical music, I am desirous of pursuing the beauties of melody and harmony still further; but of late I have become perplexed as regards the application of accidental notes, viz., passing and transient notes, appoggiaturas or notes of taste, and pedal passages (suspensions, anticipation, and melodical syncopations I am familiar with). Will any of your readers inform me of some of their uses, with examples?—W. P.

128. Will any of your correspondents be kind enough to furnish me with information on the following points with respect to "Mercator," who has given his name to that description of map known as "Mercator's Projection," viz., who he was, what he was, and to what country he belonged?—IRENE.

129. In the opening article of the "Eclectic Review" for March, on "The Genius and Writings of Bunyan," it is stated that the three greatest natural geniuses of Britain hitherto have been a player, a tinker, and a gauger. A little further it is asserted, strange though it seem, that the three most rising poets of our day are a brewer, wine merchant, and a seller of shawls. Now who are these three poets hinted at, and what the nature of their poetical effusions?—DICK WHANNAN.

130. Will any of your correspondents be kind enough to inform me what are the best means to be adopted in the preparation of canvas, in order to bring it into a state for receiving the paint?—J. Y.

ANSWERS TO QUESTIONS.

75 and 121.—*St. Bees College, Cumberland.*—The question of "A Subscriber" recalls to memory that of "Clericus," which, I think has not yet been answered, and perhaps the following hints may be of service to both.

they have the same object in view—entering the ministry in connexion with the Church of England. St. Bees College, Cumberland, presents peculiar advantages to needy students, its object being to supply a good and economical education for candidates for holy orders. The time necessary to be spent in the college is, in all cases, not less than two years. This period is divided into four terms, during which residence is indispensable. The first term commences about the 1st of January, and ends towards the 5th of May; the second begins about the 25th of August, and closes about the 5th of December. The third and fourth are like the first and second. Students are required to be in residence some days before the commencement of lectures, which begin punctually (Sundays excepted) on the 1st of February and the 1st of September. Students are admitted at the commencement of either term.

There being no collegiate buildings, each student furnishes himself with a house or lodgings in the village, under the direction and control of the principal. The expense of board and lodgings, with economy, may be very small. The fee for tuition is £10 a term, paid each term in advance; three guineas are paid by each student when he comes into residence, in aid of a fund for keeping the college in repair and increasing the library; the cap and gown cost about £1 10s.; this, with the additional cost of some prescribed books, includes all the necessary expenses. The librarian, who is generally a distinguished student of the college, is exempted from the payment of the college fee.

Before any application for admission can be entertained, the principal must be furnished with testimonials from two clergymen of the Church of England; one of these must certify (after a long and intimate acquaintance) that the party in whose behalf it is given is a man of unblemished morality and consistent piety; that he is cordially attached to the Church of England, and fitted, by his general habits, character, and attainments, for the office of the ministry. It must also specify his age and condition, as well as his pursuits from the time when he left school to that in which the certificate is granted. The other testimonial is to certify, after a sincere and *bona fide* examination, that the individual desiring admission is able to construe the Greek Gospels and Grotius *de Veritate* readily and grammatically; and that he has a correct knowledge of the rudiments of Latin composition. No student can continue a member of the college whose conduct is not in all respects satisfactory to the authorities.

The limits of age are twenty-one and thirty-five. It is desirable that the testimonials should be sent in as early as possible before the commencement of that term in which the student proposes to begin his residence.

The course of study during the four terms embraces scriptural and ecclesiastical history; the evidences of religion, external and internal; an expository knowledge of the New Testament; lectures on the creeds and the articles of religion; theology, doctrinal and pastoral; and Latin and English composition, especially that of sermons.

It is not necessary that the students should bring with them, in the first instance, more books than an annotated "Greek Testament" (Burton's), Middleton's "Grotius," and Tomline's "Introduction."

For further particulars see "St. Bees College Calendar" for 1851; Rivingtons, London.

It would be a difficult and delicate matter to point out to "Clericus" how to raise the necessary funds, for this must depend upon his own peculiar circumstances. If he has no friends to assist him, and can procure none, then his only chance is by accumulating sufficient from his present profession to enable him to study for the one he has set his heart upon. This may be difficult, but it is not impossible to the earnest man, and such a one we hope our friend is.—A. C.

91. *The Welsh Language*.—In answer to "Viator," as to what books are most suitable for commencing the study of the Welsh language, assuming that he is acquainted with the first principles of the Welsh language, I beg to forward the following list of books, which, I believe, will supply the information sought:—"Vocabulary," by D. Jenkins, Aberystwith, 6d.; "Aberystwith Welsh Interpreter," by Williams and Son, Aberystwith, 6d.; Spurrell's "Grammar of the Welsh Language," 2s.; and "English-Welsh Teacher," by Prichard, Caernarvon, 1s. If "Viator" is not acquainted with the first principles, the enclosed book ("Llyfr y Dosparth Cyntaf") is the best that I can recommend him to commence with, which I think he will find useful, together with conversing with some person that is conversant with the Welsh language; if not, he will be labouring under a great disadvantage without seeking the aid of some one.—GWILLIM.

106. *Monmouthshire not in Wales*.—The first part of H. P.'s informant's statement—that Monmouthshire is not in Wales, but that it used to be—is quite correct; but, as regards the agreement, made many years ago, by which one county passes from Wales to England once in every century, and ceases to be considered a portion of Wales, the following extracts will show that, if such an agreement ever existed, the provisions of it were never carried into effect. It is true, I have heard parties state something similar myself; but they were uneducated, and knew little or nothing of Welsh history. The mere mention of such an agreement generally creates a smile. But for something conclusive. Judge Blackstone, in treating of the countries subject to the laws of England, in the fourth section of his "Commentaries," says:—"It is enacted by this statute—27 Hen. VIII., c. 1—that the dominion of Wales should be for ever united to the kingdom of England. * * * And the statute 34 and 35 Hen. VIII., c. 26, confirms the same, adds further regulations, divides into twelve shires, and, in short, reduces it into the same order in which it stands at this day, differing from the kingdom of England in only a few particulars, and those, too, of the nature of privileges (such as having courts within itself, independent of the process of Westminster-hall), and some other immaterial peculiarities, hardly more than are to be found in many counties of England itself." Particular attention should be paid to the words, "divides into twelve shires, and, in short, reduces it into the same order in which it stands at this day." Blackstone wrote in the reign of George III.

T. C. Thornton, in his "Popular Geography," says:—"Wales was formerly of greater extent than it is at present, being bounded only by the Severn and the Dee; but, after the Saxons had made themselves masters of all the plain country,

the Welsh, or Ancient Britons, were shut up within more narrow bounds, and obliged gradually to retreat westward. It does not, however, appear that the Saxons ever made many further conquests in their country than *Monmouthshire* and *Herefordshire*, which are now reckoned part of England."

The following extract is from James Bell's "Geography:"—"Divisions in Alfred's time."—The present division of England in counties or shires owes its origin to Alfred.

According to the division of England by Alfred, it contained but thirty-two counties, Durham and Lancaster being included in Yorkshire, Cornwall in Devonshire, Rutland in Northamptonshire, *Monmouthshire* in Wales, and Northumberland, Westmoreland, and Cumberland being subject to the Scots. The statute 34 Henry VIII., c. 26, gave to the counties of Wales, and to the adjoining counties of England, the names and extent which they still retain."—Vol. iii., part xi.

I will make no remarks upon the above, but leave H. P. to draw his own conclusions.—D. J.

107. *The French Language*.—In answer to an inquiry inserted in your valuable periodical as to which books are best adapted to one in the position which D. J. describes, I would beg to suggest that he will find John Cassell's books on the study of the French language both very excellent and very cheap. The first one, "Easy Lessons in the French Language," price 6d., is compiled expressly for self-instruction in its rudiments; and "The Manual," price 2s., is adapted to the student who has passed through the former.—PHONO.

109. *The Temperature of Water from a Pump*.—A. Z., doubtless, has heard of the philosophers who were puzzled to account for the difference in the weight of an animal before and after its death. Now, is he or his "friend" certain, from experiment with a thermometer, that the case is as his query insinuates? For the case as stated many plausible reasons may be assigned; but all of them are, to a certain extent, hypothetical, and would therefore, if wrongly based, give rise to a pleasant parody on scientific explanation. A. Z. is aware that there is an exact ratio between the average temperature on the surface of the earth and the temperature in approaching towards the centre of the earth: the farther we recede from the surface, so much the warmer does it become. The principle here involved might be construed to serve as an explanation. Again:—Friction is continually taking place in the barrel of the pump. Friction gives rise to heat; and the frictive operation regularly repeated must, by all laws, be accumulative of heat; and this heat, during its progressive stages of increase, necessarily passing to the water, must consequently, from time to time, raise its temperature also. In advancing these statements, we would distinctly intimate that the explanations they contain are not supposed to be applicable in case the water manifests the enumerated symptoms to the organs of touch. It is doubtful whether the most delicate instrument would indicate the effect of the issue of the combined causes which we mention; and it is certain that no thermometer can show an increase in the temperature of each successive body of water which the pump propels.—E. S. J.

110. *Anecdote of O'Connell*.—The circumstances referred to in this anecdote happened on the 30th of July, 1838. The Chancellor of the

Exchequer (the Right Hon. Thomas S. Rice) had moved the annual grant of several thousand pounds for the Roman Catholic college, Maynooth. This grant was opposed, first, by Colonel Sibthorp, member for Lincoln; then by Colonel Percival, member for Sligo; and then by Colonel Verner, member for Armagh, all in succession. They were followed by O'Connell, who, after amusing the house by calling the three colonels the "church militant of the house," convulsed the members with laughter by an "impromptu parody" on Dryden's well-known lines. "O these gallant colonels!" said he; "I must venture a parody upon them.

"Three colonels in three distant counties born
Did Lincoln, Sligo, and Armagh adorn:
The first in gravity of face surpass'd;
Sobriety the next—in grace the last.
The force of nature could no further go—
To beard the first she shaved the other two."

What made this so ludicrous was, that Colonel Sibthorp was "bearded like a pard," while the two others had faces as smooth as monks.

J. K.

113.—*Diary*.—The best form of diary, for ordinary use, are those prepared and sold by the stationers, providing a space for each day, with the date of the month and year. These are so convenient for after reference—a great point in the matters. If, however, you would frequently require more space than ordinary diaries provide you must of course have one made to meet your own peculiar wants. The diaries prepared for the use of the legal profession are generally conveniently made. It is well to enter, if ever briefly, the proceedings of each day. Many persons enter up regularly, every morning, the proceedings of the previous day. Some prefer to close the day by a review of what they have done, and thought of. Circumstances will probably much determine this point; only, if possible, at a time and keep to it.—C. W., Jun.

Diaries are now so common, the plans of the arrangement so numerous, and the objects which they are applied so various, that the inquirer cannot expect a very precise answer to question respecting them.

The plan of a diary depends upon the object the inquirer has in view. Does he wish to preserve record of his mental life—of his daily avocation of his studies—of his desires—of his failings—his progress? Then his object is worthy of attention; for if he can attain a process that will carry out his wish, he will possess an instrument that, whenever employed, may teach him that which is so primarily important—a knowledge of self; it will bestow on him a habit of reflection worth acquiring; and in consequence of his advances, and errors being reviewed by his mind, will learn how to follow the former and avoid the latter.

Your inquirer asks for a plan of a diary, which demand I am at a loss to know how to satisfy; if his vocation is literary, he requires a different plan altogether from a commercial man: if his life is amongst the higher classes, or if his sphere is that of the counting house, it would be a great mistake to present him with the plan of a diary of a professional man. Indeed, we can hardly imagine how a system could be laid down suitable to record the mental life of two characters.

However, I may safely recommend to the notice of the inquirer, the journal of Dr. Chalmers, in the 6th chap., 3rd vol. of his life, by Dr. Hanna: or, if a diary in which to note engagements, &c., is needed, that published by Letts, Royal Exchange, would be found useful. Although Abercrombie, in his work on the "Intellectual Powers," relates of a physician who never kept any note of very numerous engagements, and yet was invariably punctual to them, it is not all who possess such a memory, so that a note book or diary of some sort is needed.

A diary must be (for the word implies it) a daily account, and such, in all proper diaries, is the case.—N. C.

The following is the plan of a diary which I have used for many years, and find to answer the purpose very well. First, like Mrs. Partridge's cook, having caught my hare—a blank book large enough to contain the record of events for a year—I drew two lines parallel with the top of the page. In the first down I inserted the day of the week, day of the month and year; in the second I indexed the contents of the page. It will frequently happen that the record of a day's proceedings will finish halfway down a page. In that case, both for the sake of neatness, to save the space, and to obtain a heading for next day, I draw a line down the middle of the page. It is not necessary, nor, I believe, is it usual, to enter each day's proceedings. My own plan is, to carry a pocket-book, and to note down anything remarkable which may occur, under its proper date, to be afterwards filled into my journal. I should also mention that I always commence with a notice of the state of the weather.—I. X. X. X.

115. *An Herbarium.*—In gathering flowers for preservation, the following things must be attended to:—"A good specimen should show every part of the plant; its root-leaves and stem-leaves; its flowers, both open, and in bud; its seed and seed vessel in their different states; and, if possible, collected together upon the same specimen." These things are of the utmost importance in distinguishing the different species of numerous families of plants. When a specimen is obtained, it should be placed between two sheets of blotting paper, in a book suitable for the purpose, the paper being first warmed before the fire. Arrange the specimen as naturally as possible, and, after carefully closing the book, put a weight upon it. The specimen should be placed between fresh sheets of blotting paper every day for about a week. When the stalk of the plant is thick and woody, the under side of the stem may be cut away. After your specimen is dried, it may be washed in a little alum-water, to prevent its being devoured by insects. In arranging the various specimens, the collector may follow any system which he prefers. The plants being thus prepared, he should procure some stout writing paper, folded in folio and stitched into a cover. A sheet of finer paper should also be obtained, and washed over with a solution of gum arabic. When dry it should be cut into a number of narrow slips: then, taking a dried plant, lay it in your book, and fasten it down by means of a few slips of the paper. In this manner all the plants for an herbarium should be treated. At the top of the page write out the class and order, and at the bottom the place where the specimen was obtained and the various Latin and English names by which,

it is known. Frances's "Grammar of Botany" is an excellent work for a beginner.

117. *Style and Punctuation.*—It would occupy considerable space to endeavour, in these pages, to provide a remedy for the defects under which E. W. L. labours. In fact, nothing short of personal correspondence (which, under the circumstances, he will agree with us, would not be desirable!) would be likely to be effectual. We will, therefore, now refer him to several little works from which we derived great assistance under similar circumstances, and doubt not, with perseverance, he will attain the end he desires. Let him obtain Day's "Punctuation Reduced to a System" (Ollivier, Pall Mall); "Guide to Oratory" (Mitchell, Red Lion-court, Fleet-street); and "A Treatise on Grammatical Punctuation" (E. T. Whittfield, Essex-street, Strand). The latter is a fine work, with full instructions for correcting for the press, and much other useful information. We shall be glad, in due time, to hear the result.—C. W., Jun.

There is a difficulty in giving advice upon style, inasmuch as a man's style is generally a duplicate of his manner of thinking. I would recommend E. W. L. to study good authors, with a determination to excel. He must not be soon daunted, although his progress be slow, as it is no easy matter to become a successful writer. "Not every musician who can make a noise, and show slight of hand upon an instrument, is fit for a composer of music; neither is every man who can think with freedom, able to write with good effect." I would recommend E. W. L. to procure Reid's "English Composition," a most useful little work, published at 2s.—H. C.

120. *The Origin and Nature of Manors, &c.*—Perhaps the following brief account of manors will be sufficient for your correspondent, "Inquirer:"—

Manors arose out of the division of land among the barons at the time of the Norman Conquest, and are the consequence of feudal tenure. It being a fundamental rule of this tenure that all lands are holden of the king, the barons were allotted certain lands, which they held of the king by military service, and the other incidents of feudal tenure. A portion of this land they retained for their own immediate use, which formed their demesne; a portion they let out to tillage, to their serfs or villans (the present copyhold land); and a portion was granted to their military retainers by what was called knight service, or some other more honourable tenure than that of villanage. The remainder of the land was waste or common, and was used by all the inhabitants equally. This was the origin of manors. The owner was called the lord, and held courts, termed courts leet and courts baron, for the redressing of misdemeanours and recovery of debts. The barons in many cases granted these manors to the inferior nobles, to hold of themselves, and on the same tenure as they held of the king. These inferior lords acted on the same principle of subletting, and had vassals in the same way as their superior lords. This system of subinfeudation proceeded for some time, till the great barons began to perceive that, by not knowing where to look for the tenant to whom they granted the land, they were deprived of all substantial rights as suzerain. This being a serious inroad on their power, they caused the statute *Quia Emptores* (so called from the first

words of the act) to be passed, in the reign of Richard the First. This statute provided that on the sale of any land no new seignior, or intermediate tenure, should be created, but that the purchaser should hold of the *same lord* as the *owner immediately preceding him*. No new seignior having from that time been created, of course all existing manors, which include a seignior, must have been created prior to the passing of the statute. There is an exception, however, in the case of the king, who, being lord paramount of all lands in the kingdom, has the right of creating what manors he thinks proper out of the royal lands.

The subject is rather an intricate one, and to understand it fully a knowledge of the feudal law is requisite. I shall be glad, however, if I have been able to furnish the information your correspondent requires. The chapter on tenures, in Blackstone's "Commentaries," and Sullivan's "Feudal Law," will, I think, afford any further information that may be wanted.—J. L.

Manors are, in substance, as ancient as the Saxon constitution, though, perhaps, differing a little in some immaterial circumstances from those that exist at this day. It is from the Normans that we derive the particular form of manors with which we are now conversant; and among these a manor (*manerium*, or *manuendo*, because the usual residence of the owner) seems to have been a district of ground held by lords or great personages, who kept in their own hands such parts of it as were necessary for the use of their families, which were called *terra dominicales*, or demesne lands, being occupied by the lord, or *dominus manerii*, and his servants. The rest, or tenemental lands, they distributed among their tenants, to be held of them in perpetuity.

A manor consists of two parts, viz., *demesnes* and *services*; and neither of these two parts have the name of a manor without the other; for, as a messuage or lands cannot be called demesne without tenants thereunto belonging to pay rents and do services, so, on the other part, though a man have tenants to pay him rents and do him service, and no messuage or lands whereupon to keep his court and to receive his rents and services, this cannot be called a manor, but only a seignior in gross. The two material causes of a manor, then, are demesnes and services. The *demesnes* comprise all that part of the land retained by the lord for his own use, and from which the other parts were dismembered. The freehold of these is vested in the lord, and they were formerly cultivated by his villans for the maintenance of his family. The *services* were the returns due from the persons to whom the lord had granted the freehold of the rest of his lands, to hold of him as of his manor. The uncultivated part of the manor was called the lord's waste, which served for public roads, and for common of pasture to the lord and his tenants.

Manors were formerly called baronies, as they still are lordships, and each lord or baron was empowered to hold a domestic court, called the court baron, where they might redress misdemeanours within their precincts, punish offences committed by their tenants, and decide and abate controversies arising within their jurisdiction. This court is, indeed, the chief prop and pillar of a manor; and if the number of suitors should so *fail as not to leave sufficient to make a jury* or

homage, that is, two tenants at the least, the manor falls to the ground.

Quia Emptores, &c.—In the early times of our legal constitution the king's greater barons, who had a large extent of territory held under the crown, frequently granted out smaller manors to inferior persons, to be holden of themselves; in imitation whereof these inferior lords began to carve out and to grant to others still more minute estates, to be held as of themselves; and were so proceeding downwards, till the superior lords observed that by this method of subinfeudation they lost all their feudal profits of wardships, marriages, and escheats, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the fee-tenant, or him who occupied the land; and also that the mesne lords themselves were so impoverished thereby that they were disabled from performing their services to their own superiors. This occasioned, first, that provision in the thirty-second chapter of Magna Charta, 9 Hen. III., "that no man should either give or sell his land without reserving sufficient to answer the demands of his lord;" and afterwards the statute of Westminster, or *Quia Emptores*, 18 Edw. I. c. 1., which directs, "that upon all sales or feoffments of land, the feoffee shall hold the same, not of his immediate feoffor, but of the chief lord of the fee, of whom such feoffor himself held it." The practice of creating manors, or tenancies in gross, was effectually prevented by the statute *Quia Emptores*, in consequence of which all manors existing at this day must have been created before the 18th Edw. I.; for it is essential to a manor that there be tenants to hold of the lord, and no person since that period could, upon the grant of an estate in fee simple, create a tenure of himself.—H. S. W.

121. *On entering the Ministry of the Church of England.*—"A Subscriber" might, if he already possess the requisite qualifications for taking holy orders, which have reference to age as well as moral and intellectual endowments, apply at once to the bishop in whose diocese he resides for admission, at the proper time, to the preliminary examination, which will probably be allowed, in case he can produce testimonials from two or more clergymen of the parish in which he resides as to his character and fitness for the office; or he might enter his name as a sizar at one of the small colleges at Cambridge (Clare, or Pembroke, or St. Peter's), where the expenses might be kept down to £60 or £70 per annum; and if he could then procure one of the London Companies' exhibitions it would materially assist him; or, lastly, if willing to go out as a missionary, he could receive the requisite education at King's College, London, or at one of the Missionary Society's colleges, for almost nothing, the only expense being, I believe, his board and lodging. For fuller particulars he might apply to the bishop's examining chaplain, to the tutors of the colleges, or to the secretaries of the Missionary Society and of King's College, London.—FIL.

123. *Cambridge University.*—All information respecting the University of Cambridge necessary previous to becoming a member is to be found in the "Calendar," to which I would refer your correspondent, and others who may wish to know what are the expenses, terms to be kept, lectures attended, examinations passed, &c. There also will be found a full description of the courses of

study for honours and for an ordinary degree respectively; and it will be seen that, while the former consists almost exclusively of mathematics, the latter is of a more elementary, but at the same time more general character, embracing Greek and Latin authors, Greek Testament, Paley's "Moral Philosophy," church history, the elementary mathematics, and, recently, a professorial examination in one or more of what are called "the natural sciences." That part only of your correspondent's inquiry, an answer to which is not contained in the "Calendar," remains to be considered, viz., "what are the peculiar advantages of pursuing each course of study respectively after one has left college?" A proper solution of this question is to be sought, I apprehend, in a variety of circumstances, mostly independent of the consideration of what may be the intrinsic value of the higher mathematics as a mental discipline—in the situation and prospects of the student—in his strength of constitution, his "aptitude for mathematics," his ultimate views with regard to the choice of a profession, and his expectations of after-preferment, if in the church. If he possess good health, with tolerable skill in apprehending mathematical theorems, and intends studying for the bar, the mathematical course of study would undoubtedly be preferable, and he would find the advantage of it through life in a sharpened intellect, in greater readiness in arranging and classifying facts and evidence, in deducing general conclusions from numerous and apparently contradictory statements, in detecting and exposing fallacies in the arguments of others, and in producing conviction by his own. In the same manner, but in a different degree, the study of mathematics will be useful to the members of every profession—to the theologian and politician (vide J. Stuart Mill's "Logic")—and to the eu-

gineer, the mechanic, the military man (vide Whewell's "Cambridge Studies" and "Thoughts on the Study of Mathematics;" also, Warren's "Law Studies," and Professor Sedgwick's "Discourse").

On the other hand, a total incapacity for mathematical study, especially if combined with ill health, ought to deter any one from attempting to graduate in honours (vide Andrew Combe's "Principles of Physiology," ch. xii., xiv.). Many who have gained that distinction at the expense of a ruined constitution and blighted hopes of after-usefulness have regretted their folly ever after. The course of study for an ordinary degree is for the great mass of students, who will have neither time nor inclination in after-life to become proficient in science, more really useful than the higher mathematics. Bacon himself, the great master of modern philosophy, in later life condemned with severity the high pretensions of the mathematicians, "Delicias et fastum mathematicorum." Assuming the well-being of the human race to be the end of knowledge, he pronounced that mathematical science could claim no higher rank than that of an appendage or an auxiliary to other sciences.—(Macaulay's "Bacon.")

In conclusion, I would advise your correspondent, if he finds much difficulty in understanding the first six books of Euclid, and Elements of Algebra and Plane Trigonometry, which are the A B C of Mathematical Science, to suspend his decision upon the course he will adopt until after he has been a term or two at Cambridge, when he will know better, by a comparison of himself with his fellow-collegians in the examination, what he is capable of doing, and will, besides, be able to have the advice of an experienced tutor upon his chances of success in studying for honours.—A TRINITY MAN.

The Young Student and Writer's Assistant.

GRAMMAR CLASS.

Exercises in Grammar. No. IX.

1. Make a form like the one given, and arrange the pronouns in their respective columns.

John and I are going to Bristol, where we expect to remain with a friend, who has kindly invited us to spend a month at his house. My sister is to remain at home, to take care of our little ones, each of whom has promised to attend

PRONOUNS

to every word which she may say to them. The horse which is to take us is mine, purchased with my own money, and hence no one has any right to control me in the use of it. This house of his, that was given him by that uncle that set him up in business, has been seen by the whole of his relations who have made it their business to visit him, and whom he has entertained to the best of his ability. His house is, indeed, larger than ours, but its fittings are not nearly so elegant. Whoever maliciously injures a friend, is sure to hate him. That is a fine horse, whosoever it is. We are all here. Which do you want? What message have you to send to my friend? Thou art innocent, therefore thy conscience is easy. I have some nuts; will you take a few? Perhaps you will prefer an apple, if I can find one. Ye are not your own. Those peaches are some of the very best sort. That book of Hannah's is very neat, as her papers usually are. This writing is hers, too; it is very pretty. Whatsoever thy hand findeth thee to do, do it with all thy might. Whichever you choose, I shall be satisfied.

2. State the peculiarities of the following adjectives, and account for them, so far as you are able:—

Good, bad, worse, better, old, evil, ill, late, more, nether, near, further, farther, former, next, most.

LOGIC CLASS.

Exercise on the Art of Reasoning.—No. XX.

1. What are the objects of "Method?"
2. Show how far, if at all in your opinion, any one of the "Methods" quoted in Paper XX., fails to include all the objects in Nature.
3. Write a Criticism on any one of the "Methodologies" which you do not take up in answer to Query II.
4. What are the Laws of Association?
5. Distinguish between, and show the respective offices of, Analysis and Synthesis.
6. A brief view of the several points comprehended in our Logic Class.
7. How far have I, i.e., each individual, benefited from the course of study given me?

MATHEMATICAL CLASS.

SOLUTIONS.—VIII.

Arithmetic and Algebra.

Question 28.—Let x be the time required; then the son would do $\frac{1}{x}$ of the work in 1 day, and the father $\frac{1}{b}$.
 \therefore The father and son would $\frac{1}{b} + \frac{1}{x}$ or $\frac{x+b}{bx}$ in 1 day.

But this per question = $\frac{1}{a}$

$$\therefore \frac{x+b}{bx} = \frac{1}{a}$$

$$ax + ab = bx$$

$$\therefore x(b-a) = ab$$

$$\therefore x = \frac{ab}{b-a} \text{—Ans.}$$

J. C. M. C.

Question 29. By "Euclid," book i., p. 47, the square of the hypotenuse is equal to the sum of

the squares of the base and perpendicular. Hence the height of the wall = $\sqrt{40^2 - 15^2} = \sqrt{1375} = 37.08$.—Ans.

Question 30. The side of the square may be found by extracting the square root of the area. 67 acres, 2 roods, 16 perches = 10816 perches. $\sqrt{10816} = 104$ perches, or 2 furlongs, 24 perches.

R. J.

Question 31. Given $x^2 + xy = 126$ } to find x
 $xy - 2y^2 + 5 = 0$ } and y .

Substitute vy for x ;

$$\text{then } v^2 y^2 + v y^2 = 126 \quad (1)$$

$$v y^2 - 2 y^2 = -5 \quad (2)$$

$$\text{from (1) } y^2 = \frac{126}{v^2 + v} \text{ and from (2) } y^2 = -\frac{5}{v-2}$$

$$\therefore \frac{126}{v^2 + v} = -\frac{5}{v-2}$$

$$\text{or } -5v^2 - 5v = 126v - 252$$

$$\text{by transposing } 5v^2 + 131v = 252$$

\therefore completing the square—

$$v^2 + \frac{131}{5}v + \left(\frac{131}{10}\right)^2 = \frac{252}{5} + \left(\frac{131}{10}\right)^2 = \frac{22201}{100}$$

and extracting the root—

$$v + \frac{131}{10} = \pm \sqrt{\frac{22201}{100}} = \pm \frac{149}{10}$$

$$v = \frac{149}{10} - \frac{131}{10} = \frac{18}{10}$$

$$\text{or } -\frac{149}{10} - \frac{131}{10} = -28$$

$$\text{and } y^2 = -\frac{5}{v-2} = -\frac{5}{\frac{18}{10}-2} = 25$$

$$\text{or } y^2 = -\frac{5}{-28-2} = \frac{1}{4}$$

$$\therefore y = \pm 5 \text{ or } \pm \sqrt{\frac{1}{4}} \}$$

$$xy = x = \pm 9 \text{ or } \pm 28 \sqrt{\frac{1}{4}} \text{—Ans. T. B.}$$

Geometry.

Question 14. The solidity of the pyramid being equal to the solidity of the sphere = $18^3 + 236 = 3053.6352$ inches.

Now the side of the pyramid = the solidity of the same when its lineal edge or side is 1. (i.e., .1178511) multiplied by the cube of the lineal edge or side of the pyramid in question.

Let x = the side required;

$$\text{then } x^3 \times .1178511 = 3053.6352,$$

$$\text{or } x^3 = \frac{3053.6352}{.1178511} = 25910.9605$$

$$\therefore x = \sqrt[3]{25910.9605} = 29.5 \text{ inches.—Ans.}$$

L. E.

Question 15. $2^3 \times .5236 = 4.1888$ feet solidity of the sphere, and $4.1888 \div 2 = 2.0944$ feet solidity of the hemisphere;

then $(2.0944 \times 1728) + 277.274 = 13.05$ gallons imperial.—Ans.

R. M.

Mechanics.

Question 13. Depth of the water,

$$= 100 - 56 = 44 \text{ feet;}$$

mean height to which it is to be raised,

$$= 56 + \frac{1}{2} = 78 \text{ feet;}$$

weight of the water,

$$= 17^3 \times .7854 \times 44 \times 62.5 = 624196.65 \text{ lb. ;}$$

work in raising it,

$$= 624196.65 \times 78 = 48687338.7;$$

time required,

$$\frac{48687338.7}{2560} = 19018.49 \text{ m.} = 39 \text{ d., } 4 \text{ h., } 58.49 \text{ m.}$$

the days being 8 hours each.—Ans. T. L. D.

Question 14. Work due to the velocity of the train at the foot of incline (by solution 10)=1536000.

Work of ascending 1 foot of the incline

$$= \frac{100 \times 2240}{100} + 100 \times 8 = 3040.$$

Therefore, distance ascended

$$= \frac{1536000}{3040} = 505.26 \text{ feet.} \quad \text{—Ans. W. H. R.}$$

QUESTIONS FOR SOLUTION.—X.

Arithmetic and Algebra.

36. If 7 horses eat as much grass as 9 cows, and 5 cows as much as 14 sheep, how many, either horses, cows, or sheep, could summer on a field which will keep 19 cows and 87 sheep?

37. Tea at 8s. per lb. is mixed with tea at 4s. 6d., and the value of the mixture is 5s. per lb. How much of each was used in 112 lb.

38. In what time will £700 double itself, at 4 per cent. per annum, compound interest?

39. Given $3x + 11y = 104$, and $3x^2 + 11y^2 = 782$, to find x and y .

Geometry.

19. Four men joined in the purchase of a grindstone, 3 feet in diameter. A paid $\frac{1}{4}$, B $\frac{1}{4}$, C $\frac{1}{4}$, and D the remainder of the price. The condition on which it was purchased was, that each person was to have the entire use of it, in the order in which his name occurs, until he has used his share, and that 6 inches diameter was to be allowed for waste. It is required to find the diameter of the stone when it came into the possession of B, C, and D, respectively.

Mechanics.

17. A certain mine is 140 fathoms deep. In what time will a stone dropped from the surface reach the bottom?

18. A ball is projected at the rate of 200 feet per second in an horizontal direction from the top of a tower 180 feet high. How far will it go, supposing that the atmosphere offer no resistance?

Notices of Books.

The Autobiography of William Jerdan, with his Literary, Political, and Social Reminiscences and Correspondence during the last Fifty Years. Vol. I. London: Hall, Virtue, and Co.

William Jerdan is "a man of letters"—almost a literary patriarch, having been connected with the periodical press for half a century. With an experience so extended, no wonder that he has been able to make this first volume of his autobiography a very pleasant, readable, after-dinner book. On finishing the perusal of a chapter, one feels as though he had an interesting half-hour's chat with the author; and, though we may not have been struck with his profundity, we shall admire his cheerfulness and communicability. He appears to tell us all he remembers of the scenes through which he has passed, and he tells that all in such an easy conversational style, that we close the first volume anticipating with pleasure the perusal of the second.

Jerdan, like so many others who have served their generation at the press, on the platform, and in the pulpit, is a Scotchman, and was born at Kelso, on the 16th of April, 1782. With the other boys of the place above the poorest orders, he was educated at the parochial school, and designed for the legal profession. When nineteen years of age he removed to London, and obtained a situation as clerk in the house of a West India merchant, where he came in contact with Mr. John Prie, a clerk, and Mr. Peter Laurie, a foreman in a saddler's shop, both of whom have since had the high civic honour of becoming Lord Mayor. Jerdan, like Jeffrey and Baines, whose lives we have recently noticed, joined a small literary society, which must have proved of immense service to him. He says, "It consisted of the three

Pollocks, three Wildes, two Bramahs (sons of the ingenious and celebrated mechanic), Frederick Burchell, and myself. * * * And here let me pause to offer a few words in earnest commendation of youthful associations of this kind. They are of immense utility in developing the intellectual faculties, in stimulating to instructive competition, in leading to self-improvement and a right standard of self-value, and in worthily employing the time which is otherwise but too likely to be wasted, if not worse, in idleness and want of thought. Our literature, our statesmen, our senate, our pulpit, our bench, our bar; yea, our public, and civil, and corporate, and even our vestry meetings, afford abundant evidence of the future capacity which is derived from such exercises, and eminently they serve to promote the advancement of those who have been trained in their voluntary school. The gift of elocution and eloquence is, in fact, the readiest, most certain high road to preferment, and if the mind is by the same process stored with information,—

'When house and lands are gone and spent,

This learning is most excellent.'

On the talents displayed at our club assemblages, in Mr. D. Pollock's chambers, it does not become me to deliver an opinion, for I was not a laggard in the race. David and Frederick Pollock and Thomas Wilde were the most active contributors; and when I reflect on the circumstance, that the first died Sir David and Chief Justice of Bombay, the second is Sir Frederick and Lord Chief Baron of her Majesty's Court of Exchequer, and the third Lord Truro, the other day Lord High Chancellor of England, the foremost civil subject of the realm, I cannot but marvel at the fate of their fourth and their not very unequal

competitor." And to what is this to be attributed? To the fact (Jordan being his own witness) of his "*leaning for life on the fragile crutch of literature for support.*" This is a sad reflection; but the only way of escaping it is to suppose the existence of concurrent circumstances connected with the case before us, at which it would not be generous to do more than hint. Serious illness occasioned Jordan's return to Scotland, where he spent three years in congenial pursuits, and afterwards he repaired again to the metropolis. He was now in a pitiable condition, with no fixed object—unsettled and dissatisfied. His resources were limited, and his prudence more so, for he now entangled himself in the difficulties of debt. In recording this fact we are pleased to find him saying, "I cannot omit the opportunity afforded by my earliest taste of the bitter fruit which poisons every pulse of existence, earnestly to exhort my youthful readers to deny themselves every expense which they cannot harmlessly afford, and revel on bread and water and a lowly couch, in humility and patience, rather than incur the obligation of a single sixpence beyond their actual means." His scarcely-recovered health could not withstand the mortification of debt, and he relapsed into serious indisposition. His uncle, a surgeon of a Portsmouth guardship, took him under his medical care, and he spent some months upon board. He now made his first appearance as a poet in print, and he thus pleasantly describes his *debut* and his feelings on the occasion (with which some of our readers may be able to sympathize):—

"I was restless, and could not tell what was the matter with me; I pulled the paper out of my pocket every ten minutes, and again and again perused my contribution with an intensity of satisfaction, ever growing—ever new. I had been writing lines to this, and lines on that, and stanzas to * * *, and epigrams, and songs, and the first staves of epics and tragedies, ever since I was ten or twelve years old. But what were they? They were never blackened with printers' ink—never impressed and multiplied by a great machine on wetted paper—never published to the wondering world! Now the deed was done which could never be undone, and I was a printer poet!"

Jordan soon after launched upon "the treacherous sea of literature," and was engaged as a reporter upon a short-lived morning paper, the *Aurora*. In the spring of 1808 he became connected with an evening paper, the *Pilot*, and subsequently with the *Morning Post*, the *British Press*, and the *Satirist*; but in 1813 he was installed in the more important position of editor of the *Sun*, which he retained, with the editorship of the *Literary Gazette*, for the long space of thirty-seven years.

The work contains some interesting editorial anecdotes, a lively sketch of Paris in 1814, and many *et ceteras*. We purpose duly noticing the subsequent volumes, and shall defer till then our more critical remarks.

Every-Day Astronomy; or, Practical Lessons on the Celestial Sphere. By Berenice Gazewell. Bath: Binns and Goodwin. London: Whittaker and Co.

This is not a regular treatise on astronomy,

but it is what was more required—a plain and practical guide to the every-day phenomena of the heavenly orbs. The authoress takes the position of a friendly teacher; and with steady finger and intelligent gaze, points to stars and planets, talking of their movements, and telling their names. Her lessons assume a conversational form, and are divided into daily portions. She thus, in the first place, secures advantages which a didactic style would not have afforded; and, in the second, avoids presenting at once too much of the technical and uninteresting. We have often wished in by-gone days for such a work, and believing that others have felt a similar want, we cheerfully recommend this, the only volume we have met with well adapted to supply it.

A Manual of Universal History, on the Basis of Ethnography. By J. B. Wright. Bath: Binns and Goodwin. London: Whittaker and Co.

The distinguishing characteristic of this work is the combination of ethnography with history: presenting at the same time a description of manners and customs, and a relation of public events. This is a desideratum in the study of history: for in contemplating the rise, progress, or fall of nations, we often feel desirous of knowing something of their most remarkable characteristics; as, their personal appearance, their costumes, their mode of life, their habits of thought. It too frequently happens, that imagination, unguided by knowledge, in attempting to gratify curiosity runs into many and serious errors. The present volume seeks to remedy this evil by associating with the general facts of history succinct descriptions of men and manners. The work is intended to embrace four definite periods of history, viz.: "1. The primeval period, when the world was young; when the greater and wiser part of mankind dwelt in the east, in the region of the rising sun, and civilization appeared in its orient brightness, clothed with 'the golden exhalations of the dawn.' 2. The classic period of Greece and Rome, when civilization began to concentrate its brightness, and assume palpable form. 3. The mediæval period—the dark ages, so called—the night of civilization; yet with many a bright star and beaming crescent raying forth through the surrounding gloom. 4. The modern period, when the daylight of civilization being restored, it is advancing to its culminating point." Such, then, is the prospectus which our author lays before the public; and with it he presents the first volume on the "Primeval Period," intimating that the appearance of the other volumes will be regulated by the reception given to this. For ourselves, we cannot but express our admiration of the plan of the work, and our satisfaction with the manner in which it has thus far been worked out. We hope the writer will be encouraged to persevere to the end, and we feel sure he will produce a useful addition to our historical literature.

We cannot conclude this notice without referring to the superior style in which the volume is got up, both with respect to the beauty of the typography, and the elegance of the binding. We have rarely seen it equalled, never surpassed.

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. XI.—ON STYLE.

"If men by nature had been framed for solitude, they had never felt an inclination to converse one with another; and if, like lower animals, they had been by nature irrational, they could not have recognised the proper subjects of discourse. Since Speech, then, is the joint energy of our best and noblest faculties (that is to say, of our Reason and our Social Affections), being withal our peculiar ornament and distinction as *men*, those inquiries may surely be deemed interesting as well as liberal which either search how Speech may be naturally *resolved*; or how, when resolved, it may be again *combined*."* The *resolution* of words belongs to that department of grammar denominated Etymology; the re-combination of them belongs in part to Syntax and in part to that portion of Rhetoric of which we are now treating, viz., Style. We are perfectly aware, of course, that the ordinary definition of a good Style, viz., "proper words properly arranged," has been assailed with the light arrows of raillery by that prince of wits, Dean Swift, who asserts that it conveys as little real information on the subject as if a telescope were described as an instrument consisting of proper glasses properly arranged. This objection, inasmuch as it implies that the queries, What are proper words? and What is their proper arrangement? require to be asked and remain unanswered, would be formidable if a similar one were not capable of being urged against all definitions; but if all other definitions, in a similar manner, present the ideas of which they are the exponents in the most concise and perspicuous form in which they can be placed before the mind, presupposing that the terms in which it is couched are already known, or delaying the peculiar signification in which they are to be understood for after-explanation, then this objection is as irrelative against this definition as against any other. A definition is a synthesis which requires to be unfolded by a minute analysis. To accomplish this analysis, and obviate the objection above stated, we have divided our prelections upon Style into two parts; the one treating of "Diction," and answering, so far as general directions can do so, the question, What are proper words?—the other concerning itself with the laws of composition so far as they regard Sentences, and affording a reply to the query, What are the proper places which words should occupy? In our previous papers we have discussed the laws of Diction, and had proceeded so far with the portion relative to Sentences as to bring us to the second quality which they ought to possess, viz., Conciseness; and to the consideration of this topic we shall now address ourselves.

II. CONCISENESS.—Conciseness is a term employed by rhetoricians to express that quality of Style in which all superfluity of words is avoided, and the ideas intended are

* Harris's "Hermes," book i. chap. 1.

exhibited with distinctness, brevity, and force. It does not countermand elegance or ornament, although it requires a skilful employment of clear, powerful, and compressed diction. It permits no "long drawn out" and elaborate artificiality—no straining after effect—no mere grouping together of high-sounding epithets—no dilution of thought; but a vivid, direct, and intelligible development of the ideas within us which pant for utterance. The chief object of Speech is, or ought to be, the communication of instruction. When the Style of an author is unnatural, stilted, grandiloquent, or verbose, this end is frustrated. When a sentence is not readily and easily understood by those parties for whom the writing was chiefly intended, the purpose of the author remains unfulfilled. Without due attention to the perspicuity and conciseness of a composition, the would-be sublime is bombast, and the most brilliantly ornate figurative language resembles the leaves of "the barren fig tree." To follow out a thought with strict logical consistency, to proportion the expressions employed to the real importance of our ideas, to give definiteness and compactness to the utterance of the intellect, and so to place before the mind the thought, the whole thought, and nothing but the thought, that it shall be clearly and distinctly understood, are the chief excellences of composition; and, if these purposes be kept in memory, and are steadily acted upon, a concise style must be the result;—

"For when the mind with clear conceptions glow,
The willing words in just expression flow."

When the soul is in earnest it cannot linger in the bowers of beauty, culling "the flowers of Rhetoric;" but improvises, in its enthusiasm, with succinctness and energy. The pure gold-ore of Intellect *may* be wrought into garish trinketry, but the concise writer is contented with bestowing upon it so much labour and ornament as shall secure its general currency. Such a Style obviously requires great concentration of mind, a thorough mastery of language, and a perception of the logical harmony of thought with thought and phrase with phrase. It stands opposed to tedious prolixity as well as to vague generality, because these are opposed to intelligibility and attractiveness. It does more. "Tediousness," says Dr. Johnson, "is the most fatal of all faults;" but an affected epigrammaticality, an overstrained sententiousness, or an elaborate smartness, in our opinion, ranks next in order. Hence it is necessary to say, be not too concise neither; express so much as will make what you leave to be understood by your hearers or readers perfectly easily perceived. A too great parsimony of words defeats its own object. Over-concise sentences may be forcible, but they are difficult of comprehension. Verbiage is distasteful and wearisome; but enigmatical brevity is annoying and repulsive. To do full justice to an idea, it must be accurately embodied in words. This, however, cannot be done if we do not condescend to discriminate, select, and arrange those terms through which a knowledge of it may be best conveyed. To pass hastily over necessary steps in an argument—to omit in our over-eagerness any needful explanatory clause, phrase, or vocable, or to slur over with incautious zeal any important element of a thought—is to defeat the object of conciseness, and to give our thoughts indistinct and imperfect utterance. Do not let it be supposed, therefore, that we advise a uniform condensation of phrase and conciseness of Style. Far from it. Diffuseness, and even prolixity, have their uses. We merely recommend the acquisition of the power of writing concisely, in order that when the necessity shall arise,

viz., when important truths demand forcible statement, you may not be found wanting. In this, as in all things else, "let your discretion be your tutor;" for rhetorical rules, being for the most part elaborations of the intellect when too strictly followed, are apt to make too little allowance for the exercise of the affections.

Conciseness must not be purchased at the expense of intelligibility. Let it never be forgotten that there is "a limit to the grasping power of man's apprehension, beyond which, if you add article to article, the whole shrinks from under his efforts. The point is, therefore, to distribute the materials of the several divisions of the fabric into parcels that may be portable without fatigue."* This is to be really and truly concise; this is the most effectual method of complying with the rhetorician's demand, viz., that no one shall be put to any unnecessary trouble in discovering what you *intend* to say. It is true that

"Within the soul a faculty abides,
That with interpositions that would hide
And darken, so can deal, that they become
Contingencies of pomp."

To the exercise of this faculty—"the shaping spirit of Imagination"—we do not object, when it is not so employed as to make composition "dark with excessive bright;" so long as the writer is not one of those who

"With gold and jewels cover every part,
And hide with ornament their want of art."

Harmonious grouping, idealized colouring, statuesque simplicity, compactness, and taste, we admire rather than deprecate. Against excessive brilliancy of diction, redundancy of phrase, and lengthiness of simile or metaphor, we are desirous of warning unpractised writers or speakers. To all such we would say, in the language of the old adage, "*in medio tutissimus ibis*:" you will be safest if you adopt a middle course. Archbishop Whately has given the same advice already, and we cannot do better than quote his directions, with the very significant reason which he gives for acting upon them, viz.:—"To an author who is, in his expression of any sentiment, wavering between the demands of perspicuity and of energy (of which the former, of course, requires the first care, lest he should fail of both), and doubting whether the phrase which has the most forcible brevity will be readily taken in, it may be recommended to use *both* expressions—first to expand the sense sufficiently to be clearly understood, and then to contract it into the most compendious and striking form. * * * The hearers (or readers?) will be struck by the forcibleness of the sentence, which they will have been prepared to comprehend; they will *understand* the longer expression, and *remember* the shorter."† "A noble energy of thought, modestly decorated by a proper and natural expression,"‡ ought sedulously to be cultivated; for, "As when the rays of the sun are collected into the focus of a burning-glass, the smaller the spot is which receives them, compared with the surface of the glass, the greater is the splendour; so, in exhibiting our sentiments by speech, the narrower the compass of words is wherein the thought is comprised, the more energetic is the expression."§

* Bentham's Works, vol. x.—"Memoirs and Correspondence," p. 74.

† "Rhetoric," p. 93.

‡ Ward's "System of Oratory," Sect. xxxv.

§ Campbell's "Philosophy of Rhetoric."

"Circumlocution seldom conduces to plainness; and you may take it as a maxim, *that* when once an idea has been *clearly expressed*, every additional stroke will only confuse the mind and diminish the effect. When you have once learned to express yourself with clearness and propriety, you will soon arrive at elegance. Everything else, in fact, will follow as of course. But I warn you not to invert the order of things, and be paying your addresses to the Graces, when you ought to be studying perspicuity. Young writers are in general, too solicitous to round off their periods, and regulate the cadences of their Style. Hence the feeble pleonasm and idle repetitions which deform their pages. If you would have your compositions vigorous and masculine in their tone, let every *word tell*."

The following extracts will illustrate what we mean in the preceding paragraphs on Conciseness, viz.:—

1st. "*It requires a clear soul to see a truth so as to believe it at first sight, and there is nothing more doubtful than a fact to an ignorant or presumptuous mind. The reason of this is, that nothing is understood while standing alone. To separate any idea from its connexion is to put it out of its place, and thus to make it a puzzle. It is like presenting a fossil to a man and asking him what it belonged to when alive, and begging him to describe the nature, property, and fashion of the creature of which it once formed a part. A large and exact extent of knowledge is demanded mentally to allocate anything, or to form a complete idea of any object before us. The man of small knowledge has a small vocabulary, and few meanings, or at least few truths, and whatever does not seem to fall in with these, he looks at as a wonder or a lie.*" †

2nd. "The use of language is not confined to its being the medium through which we communicate our ideas to one another; it fulfils a no less important function as *an instrument of thought*, not being merely its vehicle, but giving it wings for flight. Metaphysicians are agreed that scarcely any of our intellectual operations could be carried on to any considerable extent without the agency of words. None but those who are conversant with the philosophy of mental phenomena can be aware of the immense influence that is exercised by language in promoting the development of our ideas, in fixing them in the mind, and detaining them for steady contemplation. Into every process of reasoning, language enters as an essential element. Words are the instruments by which we form all our abstractions, by which we fashion and embody our ideas, and by which we are enabled to glide along a series of premises and conclusions with a rapidity so great as to leave in the memory no trace of the successive steps of the process; and we remain unconscious how much we owe to this potent auxiliary of the reasoning faculty." ‡

The general rule for concise composition is, Avoid the use of superfluous words and phrases; be content when a thought is clearly expressed; aim at acquiring such a command of language as shall enable you to get the right word in its right place at the right time. Superfluity of words must be particularly eschewed; "the world is too rich in books to endure it."

As writers distinguished in general for conciseness we would mention J. S. Mill, Macaulay, Foster, Carlyle, Sir W. Hamilton, and Grote, the historian of Greece; Crabbe, Rogers, and James Montgomery.

III. UNITY is a term employed to designate that characteristic of Style which places an idea before the mind clearly demarcated from all others, free from extraneous words, and so connectedly and completely embodied as to leave no part unexpressed—

* "Kirke White's Remains"—Letter to Mr. B. A.—, Nottingham, May 7, 1804.

† Moore's "Man and his Motives," chap. ix. p. 251.

‡ Roget's "Thesaurus of English Words and Phrases," Introduction, p. viii.

which gives an integrity and oneness to the conceptions of the intellect. Heterogeneity of expression, the disjunction and disparting of the several elements necessary to present a whole thought in its individuality, affected laconism and oracularity, needless pauses, unnecessary parentheses, and the want of a clear and distinct differentiation of one idea from another, are all opposed to unity. Unity of Style can only result from unity of thought, the capacity of taking a thorough grasp of our ideas, and an habitual striving after the attainment of continuity and fixedness of thinking. The flighty, fickle, uncontrolled mind cannot follow any intellectual operation through all its consecutive developments, and seize, retain, and represent the resulting conception; it is only from the steady, resolute, practised mind that unity of thought can be expected. To such alone is it given to rank amongst

“The mighty, who with tranquil brow,
In the pale majesty of thought, control
The boisterous world.”

The properties of a really correct Style are so closely interrelated, that attention to one point necessarily conduces to the observance of others. No composition can be concise without being somewhat perspicuous, nor perspicuous without being concise; in like manner, perspicuity and conciseness almost necessitate unity, while unity as necessarily concurs in promoting the clear, brief, and pointed expression of our thoughts. And it is well that the rhetorician's laws should be thus mutually aidant; for when an accurate knowledge of the several laws of Style has been attained, carefully studied, and rigorously practised, there naturally results an actionary and reactionary influence of one upon another, by which the comprehension of the whole is facilitated, and each becomes more easily obeyed, while the increase of light thus flowing upon the subject from numerous points enables the inquiring mind more readily to perceive the combined beauties of a clear, concise, and captivating style. Few thoughts are so definite as to be wholly detached from the modifications of circumstances, and hence it is that accessorial and dependent ideas are generally associated in the mind with the principal conception in any sentence. To indicate the respective influences which these exert upon the primary idea, like the grouping of a picture, requires skilful management. Without this, the due concatenation and arrangement of the subordinate parts in the respective gradation of their subordinacy could not be properly accomplished, neither could the chief idea be *thrown out* in accurate perspective. The general conception, destitute of all accessorial modifications, or without any mention made of the circumstantialities of time, place, or manner, is a pure abstraction, cognizable only by the philosophic mind, and not referrible in any manner to general experience. It is needful, therefore, if we wish to be understood, to attend to the circumstances which modify and influence ideas, and exhibit them in just proportion. Unity demands that the precise idea should be presented to the mind as one whole, with all its subordinate relations duly arranged and fittingly grouped, so that no misconception can possibly arise.

The following rules ought to be carefully studied and assiduously attended to by young writers, in order that violations of Unity may be as seldom as possible observed in their compositions:—

1st. Ideas having no intimate or necessary relation to, or dependence on, each other,

ought not to be associated in the same sentence; or, in other words, different topics should be treated in different paragraphs, and distinct ideas ought to be embodied in separate sentences. False metaphors and mixed figures of speech, mutually-contradictory terms applied to the same object of thought, or the introduction of two leading subjects into the same sentence, violates the above-given rule, as will be seen from the following examples, viz. :—

1. "There is a period in the history of Europe when every commotion on its surface was occasioned by one cause deeply seated, *like the internal fire that is supposed to have produced the earthquake at Lisbon*; and, like it, breaking out with violence in one place, and making itself felt in every part of the globe. This cause was the Reformation. From 1520 to 1649 the Reformation was the great lever of Europe."—*Memoirs of Europe from the Peace of Utrecht, by Lord John Russell*, vol. i. p. 27. Here it will be observed that one elevating agency has, by a mixed metaphor, been substituted for another, viz., a lever for an earthquake! Had the last sentence stood thus, "From 1520 to 1649 the Reformation was the great earthquake which convulsed Europe," the unity of the metaphor would have been sustained.

2. "Every sentence should be simple, energetic, and perspicuous; laconic, yet simple in explication; *fertile and flowing*, yet free from turgidity, pomposity, and affectation on the one hand, and sterility on the other; divested of ambiguity and vulgarity, together with a strict adherence to the rules of grammar. This being granted, Custom, like the hydra-monster Credulity, when coupled to Ignorance, must be *exploded*, and sent to seek its baneful retreat among the haunts of Superstition, in the mountains of Error, no more to make its appearance in the fruitful valleys of heaven-born Science, among the illuminated sons of Wisdom."—*Samuel Alexander's "Logical Essay on the Syntax of the English Language,"* Preface, p. vii. We can merely quote this passage; we cannot amend it.

3. "Devotion is that holy and heavenly fire which darteth into our minds the light of spiritual knowledge, which kindleth in our hearts the warmth of holy desires; if, therefore, we do continue long absent from it, a *night* of darkness will overspread our minds—a deadening coldness will seize upon our affections."—*Barrow's "Discourse on Devotion."* Were the word *night* changed into season, the unity would be preserved. We cannot talk consistently of fire being the cause of day, which is implied by the use of that word.

2nd. The course of a sentence should be interrupted as seldom as possible, whether by the introduction of parenthetical clauses, a change of the grammatical structure, or the employment of superfluous relative words or clauses. The following are examples of the neglect of this rule:—

1. "The noun, or subject of a proposition, variously modified as we have seen it may be, is frequently complicated *still farther* by a definition or description of the object which it denotes. Now, the reference of the description to the object, *and* which object is called the antecedent, because antecedently *expressed*, is marked by the relative pronoun, *which* is called *relative*, because, like the clause which it introduces, it relates to the object or antecedent. In truth, the relative is but another and varied expression for the object or noun, *which* is represented under a new relation, and therefore put in that case *which*, with the verb of the relative or descriptive clause, expresses the relation."—*Professor A. Alexander's "Elements of Greek Grammar."* The unity of this passage might be improved thus, perhaps:—The noun, or subject of a proposition, variously modified as we have seen it may be, is frequently still farther complicated by a definition or description of the object which it denotes. Now, the reference of the description to the object, which is called the antecedent, because expressed antecedently, is marked by the relative pronoun, so called because *it*, as well as the clause which it introduces, relates to the object or antecedent. In truth, the relative is but another and varied expression for the object or noun, and therefore put in such a case as, with the verb of the relative or descriptive clause, expresses a relation.

2. "My voice proclaims
How exquisitely the individual mind
(And the progressive powers, perhaps, no less
Of the whole species) to the external world
Is fitted;—and how exquisitely, too,
(Thence this but little heard of among men,)
The external world is fitted to the mind."—*Wordsworth's "Excursion."*
3. "Lorenzo, thou hast seen (if thine to see)
All nature and her God (by nature's course,
And nature's course controlled) declare for me;
The skies above proclaim, 'Immortal man'!
And 'Man immortal' all below resounds."—*Young's "Night Thoughts."*

3rd. Abrupt, short, smart, oracular, and laconic sentences must not appear too frequently in composition; although they may appear energetic, they are destitute of the dignity, beauty, and clearness which belong to the carefully-constructed though lengthy period. While by not placing the whole object and its concomitances at one view before us, but elevating each itemal relation into the dignity of an independent subject, we break the unity of aspect which it ought to possess. It does not present the picture in a group, but brings before us in succession the individual figures which are intended to form a group. Such sentences as the following are inconformable to this requirement, viz.:—

"Nor let any church of our order take upon itself, as a necessary part of its character, the form of aggression. This is often said to belong to it. If the calm and consistent presentation of principles be the strong assault upon their opposites, then such must be our offence. But it is no more. We seek not to condemn. To maintain the right is our duty. Against what may be wrong there may be in this an implicit rebuke. Yet it is not for us to trouble other churches. We doubt if certain success would compensate for all the evil the attack would provoke. To live for denominational purposes seems to us an unworthy end. It is no ultimate good. It is no immortal triumph. It is only an included benefit. It is only a subservient use. Far be it from us so to bear ourselves as though we raised but one stern protest against all who differ in anything from us; so as to set up the model of our church, as if, forsooth, we disallowed the existence and acceptance of any other."—*"Sermons," Second Series, by R. W. Hamilton, LL.D.*

The length to which our preceding remarks and extracts have extended, leaves us no space for farther remark at present. We hope to conclude, in our next paper, all the directions which are needful for writing a pure prose style; meanwhile, we say again, have these precepts "writ in your remembrance" and diligently reduced to practice.

"It was said by Charles XII. of Sweden, that he who was ignorant of the arithmetical art was but half a man. With how much greater force may a similar expression be applied to him who carries to his grave the neglected and unprofitable seeds of faculties which it depended on himself to have reared to maturity, and of which the fruits bring accessions to human happiness—more precious than all the gratifications which power and wealth can command."—*Dugald Stewart.*

"Who in the same given time can produce more than many others, has *vigour*; who can produce more and better, has *talent*; who can produce what none else can, has *genius*."—*Lavater.*

History.

WERE THE EFFECTS OF THE CRUSADES FAVOURABLE TO THE
CIVILIZATION AND MORAL ELEVATION OF THE PEOPLE?

AFFIRMATIVE ARTICLE.—III.

"Nor doth the mastering voice
Of Nature cease within to prompt aright
Their steps; nor is the care of heaven withheld
From sending to the toil external aid;
That in their stations all may persevere
To climb the ascent of being, and approach
For ever nearer to the life divine."
AKENSIDE, *"Pleasures of the Imagination."*

IN glancing back through the volume of the past history of our race, a thoughtful observer cannot but feel that every page has had its use—that it is a link in the chain of progress, the destruction of which mars the unity of the whole—which may, indeed, be dark and discoloured, black with human passions and human conflicts, but which yet is a necessary step in that gradual unfolding and opening of the human mind which has conducted us to our present state of refinement and civilization. And this principle of weighing well all the circumstances and relations of an event, its bearings upon things to come as well as things present, we feel to be especially necessary in surveying the darker scenes of history, which, with their endless succession of battles, murders, machinations, and general depravity, would otherwise lead us to doubt whether there be a divine Ruler, and by inference a divine Maker, of the universe. Nothing, we think, is more necessary to one who would read history with profit, than a conviction that every event, however apparently untoward, has been productive of benefit to mankind, and has, in the end, advanced their social and individual well-being, although we, with our short-sighted visions and imperfect faculties, may be unable to trace the manner how, or the means whereby.

On these grounds, then, had there existed no other, I should feel obliged to differ from G. N. and J. M. S. in condemning the Crusades as detrimental to the general and final welfare of the human family. That they had quite a contrary effect there is strong evidence to prove; but, before adducing it, I

will briefly examine the nature of that in which those gentlemen so confidently trust.

G. N. and J. M. S. allege, as arguments against the utility of the Crusades, that they originated in error, in superstition, and unworthy motives; that "they were carried on at the most reckless expense of property and life;" that they ended in disaster, and failed to accomplish the object with which they were undertaken. But do these premises, if well founded, prove that no advantage, or no advantage equivalent to the disadvantage, sprung from the Crusades? If it was superstition that originated them, it was also superstition against which they were directed. Mohammedanism is the very essence of superstition. And the conflict of errors has been often the cause of the evolving of truth. Men, in this case, fought, it is true, for an empty shadow; but it is also true that they soon learnt to regard it as such—to regard the objects of their superstitious veneration in a juster light. Hence the crusading spirit quickly died away. It lasted long enough only to link the European nations together by one moral bond, their mutual Christianity.

But may not superstition in the end produce good? The monks of the middle ages frequently imposed on themselves as a penance the transcribing of the scriptures. Was this superstition or not? Yet it was probably the means, under Providence, of the conservation of those scriptures, which might otherwise have been irrecoverably lost to mankind. But the Crusades, we are told, "were carried on at the expense of much blood and treasure." Were they therefore injurious to civilization and freedom? The wars of Wellington in Spain were carried on, the battle of Waterloo was fought, at the expense of much blood and treasure; but were they therefore necessarily detrimental to the dearest interests of Europe? The answer is plain. Further, if the main object

with which these expeditions were undertaken, viz., the recovery of the Holy Land from the hands of the infidels, was wholly unworthy of such gigantic efforts—of such vast expenditure of blood and money, as we grant it was—it could not, surely, be injurious to Europe generally that they failed in accomplishing their object; and if they terminated in disaster to the individuals who embarked in them, they also, as I shall now proceed to show by a statement of their effects, produced lasting benefits to millions, by improving the condition of European society.

The first and most perceptible effect was the extension of commerce. After the series of mishaps which the adventurers in the first and second Crusades had met with, the French and English, Gibbon tells us, “preferred the navigation of the Mediterranean;” and the Italian maritime cities, Venice, Genoa, and Pisa, furnished transports for the conveyance of their armies to Palestine, and likewise “provisioned them when arrived off the coast of Syria, and kept up their communication with the West.”* But these cities did not wholly monopolize the benefits resulting from commercial intercourse with the East. “The Crusaders, on their return, brought with them from Asia to Europe specimens of the productions of those strange and splendid regions; and the exhibitions of rarities excited a general desire to possess them. Thus new wants were created, the spirit of commerce was awakened, and the intercourse which had been opened by the Crusades was, after the war, continued, in order to gratify the demands of the opulent.”†

Next we see as a result the increase of personal freedom. The petty fensual barons, whose wealth consisted in the extent of their lands and the number of their villans, or serfs, and who needed money to enable them to proceed to the Holy Land with a retinue suited to their dignity, were often forced, in order to raise the requisite sums, to sell their lands to their superior lord, or liberty to their slaves. Every serf, likewise, who would assume the cross was set at liberty. These causes “greatly diminished the number of petty fiefs and small domains—of inferior

fiefholders,—and they concentrated property and power in a smaller number of hands;”* and “thus,” says Robertson, “in every state there was formed a new order of citizens, to whom commerce presented itself as their proper object, and opened to them a certain path to wealth and consideration.” These burghers, forced to depend on their mutual aid for safety, and on the products of their own labour and skill for sustenance, gradually became the most powerful bulwarks of individual and national freedom. Oppressed and plundered by the barons when beyond the protection of their own walls, they eagerly received and sheltered any serfs that fled to them for protection from the tyranny of their masters, for this strengthened their own party at the expense of the enemy. To them kings and princes would naturally look for aid against their too powerful nobles—to them they would fly for subsidies in time of war with other nations, and in return would grant them various immunities and privileges. Thus originated the great towns and boroughs.

Thirdly, if we look at the Crusades in a religious point of view, we cannot but conclude, however much to a superficial observer they may appear to have forwarded the ambitious designs of the popes, that they were, on the whole, favourable to religious liberty, to freedom of conscience, and to the eventual emancipation of the human mind from the thralldom of priestcraft and superstition. For what first opened the eyes of Luther to the enormities of the Roman system? Was it not the sale of indulgences? And this corruption, which originated in the time of the Crusades, together with the crafty manner in which the popes took advantage of the religious enthusiasm which prevailed at their commencement to extend their power—“to bind the kings with chains, and the nobles with fetters of iron”—had undoubtedly, long previous to the time of Luther, opened the eyes of millions to the grasping and ambitious designs of Rome. “Numbers of the laity,” says Guizot, “viewed her policy and manners, and could see how much of personal interest influenced religious controversy. Doubtless this new knowledge inspired many minds with a hardihood till then unknown.”

Another, and by far the most important

* Sismondi's “History of the Italian Republics,” in one vol., p. 29.

† See also Guizot, “Civilization,” &c., vol. i. pp. 155—157.

effect produced, was the general extension of knowledge. Between the moral and intellectual condition of the people of the eleventh and that of the thirteenth century there is a wide interval. "Compare," says Guizot, "the contemporaneous chroniclers of the first Crusades with those of the twelfth and thirteenth centuries; for instance, Albert d'Aix, Robert the Monk, and Raymond d'Agiles, who took part in the first Crusade, with William of Tyre and James de Vitry. When we compare these two classes of writers, it is impossible not to be struck with the distance which separates them. The first are animated chroniclers, full of vivid imagination, who recount the events of the Crusade with passion. But they are, at the same time, men of very narrow minds, without an idea beyond the time in which they have lived—strangers to all science, full of prejudice, and incapable of forming any judgment whatever upon what passes around them, or upon the events which they relate. Open, on the contrary, the "History of the Crusades" by William of Tyre; you will be surprised to find almost an historian of modern times—a mind developed, extensive, and free

—a rare political understanding of events, completeness of views, a judgment bearing upon causes and effects. James de Vitry affords an example of a different kind of development; he is a scholar who not only concerns himself with what has reference to the Crusades, but also occupies himself with manners, geography, ethnography, natural history; who observes and describes the country. In a word, between the chroniclers of the first Crusades and the historians of the last there is an immense interval, which indicates a veritable revolution in mind."

If, then, the advocate for the beneficial influence of the Crusades be asked in which of their numerous effects he discovers that influence, his answer is ready:—"In promoting commerce and intercourse between nations; in bursting the bands of the oppressor and letting the oppressed go free; in sowing the seeds of the glorious reformation in religion; in awakening Europe from the sleep of ages, to run the career of improvement, until, in wealth, liberty, and intelligence, she had left the ancient seat of learning and religion, the birthplace of the human race, far, far behind." F. J. L.

NEGATIVE ARTICLE.—III.

If the human mind be susceptible of improvement under circumstances disadvantageous to its own welfare—if it be possible that any benefit can accrue to those who, being unfortunately the victims of superstition and idolatry, are buffeted with the scorn and derision of beings who profess to be the disciples of a religion which teaches us "to love our enemies," and "to do good to them that hate us"—or if the surest and simplest means of achieving a benevolent and praiseworthy object be to appeal to the malevolence and prejudice of those with whom we have to deal, to offer violence to their bodies, to set at nought the precepts of that faith which they profess, and openly, whilst giving assurance to the world of their good intentions, to negative them by our acts—then the advocates of the holy war have good reason to congratulate themselves on the position assumed by C. W., Jun., in the September number of this journal. But the proofs which he adduces to establish the truth of his argument by no means answer the desired end. If the extracts quoted are

sufficient to substantiate the view taken by him, then there is, at once, an end to the discussion. In themselves they are mere assertions; it therefore becomes our duty to see if they will agree with facts—to ascertain if they are likely to agree with the data which history has furnished, and whether they were the causes of those favourable results to which our opponents refer. C. W., Jun., has merely contented himself with a few extracts, affirming that the Crusades promoted the civilization and moral well-being of the people; but he forgot to explain to his readers how such effects were possible, when contrasted with the many baneful and noxious influences which were generated by, and attendant upon, all the Crusades. I shall prefer dealing even more "liberally" with the question than he has, and will endeavour to take a more extensive view of the whole subject. It must be admitted that certain effects always follow from certain causes; and, when it is considered that wars on so gigantic a scale as those which we are now discussing must of necessity be pro-

ductive of much good or evil, we can readily arrive at something like truth by making ourselves acquainted with the question in all its bearings, and drawing conclusions from the *total ensemble*, without attributing credence to gratuitous assumptions, which are only mere assertions in themselves, without affording the reader any clue by which he may seek to form his own opinion, independently of the views of any author. If we examine the principal elements which were at work in the holy wars—the motives which impelled the Crusaders to action—the professions which they made, and how they were carried out; and if we ascertain in what degree of prosperity Europe stood both before and after the wars, not forgetting to see if the feudal power was broken, whether the barons maintained inviolate their domineering tyranny over the serfs, and also whether the clergy were benefited or not by the Crusades—it cannot but be that we shall be able to form our own opinion on the result of the Crusades.

Of all wars, religious feuds are most to be lamented and deplored; and this applies with double force in the present instance. A people professing Christianity, acknowledging one Saviour as their head, and his injunctions as their rule or standard by which to measure their conduct, formed themselves into one mass for the purpose of recovering, per force, the scene of our Lord's sufferings, &c., in order that they might go thence and do him homage, forgetful that he was "risen and was not there," and that a grateful heart maketh every place a Jerusalem, where God may as well and as acceptably be worshipped. Without prejudging the question, the narration of these wars, which devastated Europe for two centuries, destroyed the lives of upwards of two millions of human beings, besides involving the destruction of an immense amount of property, other than that of military paraphernalia, &c., the generation of those evils which are attendant upon all wars (and this, being a religious one, only aggravated the evil, for then the worst feelings of our nature are aroused and brought into play), besides the hindrances and impediments which were created, and which would necessarily retard the progress, not only of civilization, but of commerce and the education of the people; when, I say, all these disastrous and fiend-like calamities are

set before the reader, they afford a melancholy exemplification of cruelty, treachery, robbery, and an utter disregard of the sacred character of human life. Let it be remembered, too, that the Crusaders were, or professed to be, Christians; and further—and this seems anomalous, and the more irreconcilable with the very doctrine which they acknowledged—all this was perpetrated against the infidels, a race whom we should have supposed they would have endeavoured to reclaim, if not by their religion, certainly by humane and conciliatory conduct—by examples of meekness and kindness of spirit, by benevolence and gentleness of temper and intention.

But it will be seen by those best acquainted with those portions of England's history that the fraud, cruelty, and treachery which were practised towards the heathen (besides the divisions and dissensions which frequently took place between the Christians) only served to open the eyes of the infidels to the real intentions of the former, to see them in their true colours, to discern their hypocrisy, to increase the animosity and hatred which already existed, to widen the breach between them, rendering further intercourse the more improbable, and extended concessions impossible. Granted, for argument's sake, that their real intentions were pure—how miserably carried out! and if not pure, how could good result? "By their fruits ye shall know them. A good tree cannot bring forth evil fruit, nor can a corrupt tree bring forth good fruit." Yet, forsooth, according to the argument of C. W., Jun., this emphatic declaration was falsified, and the order of nature "inverted." But enough of prelude. Now to an examination of the question by historic testimony.

We will first institute an inquiry into the question, whether the infidels were endangering the safety of Europe? Mill informs us that "no dangers hung over Christendom at the time when the Crusades commenced. But, as they (the Christians) had acquiesced for ages in the existence of Islamism, they could not afterwards draw the sword, except for the purpose of preventing or repelling new aggression."

The conduct of the Christians, and their general character, is thus described by Fuller:—"These Hospitallers afterwards getting wealth, unloosed themselves from the strict-

ness of their first institution, and grew loose into all licentiousness. The Templars, to whom the king promised the spoil if they took it, entered through this breach into the city: they set a guard at the breach, that no more of their fellow-Christians should come in to be sharers with them in the booty."—"But the most remarkable church matter in this king's reign was the clandestine christening of a sultan of Iconium. And more of his courtiers might have followed him, but that his ambassadors, being at Rome, were offended with the viciousness of the Christians' lives, which made them to exclaim, 'How can fresh and salt water flow from the same fountain?' This hath made many pagans step back which had one foot in our church, when they saw Christians *believe so well and live so ill*, breaking the commandments against the creed. * * King Almeric having looked on the beauty of the kingdom of Egypt, longed for it; and now no longer to drive out the relics of the Turks, but to get Egypt to himself; and the next year, against the solemn league with the caliph, invaded it with a great army. He falsely pretended that the caliph would make a private peace with Noradin, king of the Turks, and hence created his quarrel. An oath being the highest appeal, perjury must needs be a heinous sin, whereby God is solemnly invited to be a witness of his own dishonour. I know what is pleaded for King Almeric, viz., that Christians are not bound to keep faith with idolaters. But open so wide a window, and it will be in vain to shut any doors. All contracts with the pagans may easily be voided if this evasion be allowed. And God, to acquit himself, knowing the Christians' prosperity could not stand with his justice after their perjury, frowned upon them."—"Yea, never could the *christian religion* be shown to pagans to more *disadvantage*. *Grecians and Latins* were at *deadly* feud. Many among the Latins, Guelfs and Ghibellines sought to ruin each other. *Humility* was *preached*, and *pride* practised; they *persuaded* others to *labour* for *heaven*, and fell *about earth* themselves; *their lives* were *contrary* to *their doctrines*, and their doctrines one to another."—"Meladin, much troubled with this loss, to purchase peace, offered the Christians all Jerusalem, in as ample a manner as ever formerly they had enjoyed it—all *prisoners* to be *released*, with

a *great sum* of MONEY to defray their charges, and many other good conditions; so that we may much wonder at his profuseness, and more at the Christians' indiscretion in their refusal."—"Next unto superstition, which was deeply inlaid in the holy war, we may make the Christians' *peace breaking* with the infidels the second cause of their ill success. When Godfrey first won Jerusalem, *pardon* was *proclaimed* to all the Turks who yielded themselves; yet, three days afterwards, in cold blood, they were all, without difference of *age* or *sex*, put to the sword."—"And how could safety itself save this people, and bless this project, so blackly blasted with perjury?"

Referring to the Christians falling out amongst themselves, he says:—"But these civil wars amongst themselves were dangerous, and destructive to religion."

Keighley (who views the wars favourably) says:—"It is not our desire to exalt the Mahometans at the expense of the Christians; but these facts, all of which are related by the people themselves, testify strongly for the *degeneracy* of the latter, and *for the benefit* which the fall of their power was to the *Holy Land*, over which they were no longer worthy to hold dominion."

Mill says:—"None of the principles which originally caused the Crusades influenced the actions of either." At the siege of Acre, as well as at the old siege of Antioch, the morals of the holy warriors were as depraved as their condition was miserable. The Crusaders were seemingly devout, but in reality were *dissolute*; and compromised for personal excesses by *pharisaical scrupulosity* and *uncharitableness*.

The "Encyclopædia Londinensis" says:—"The Christians neither could agree while marching together in armies with a view to conquest, nor could they unite their conquests under one government after they had made them. *They were continually making war upon one another.*"

Their cruelty in war is equally as revolting as their hypocritical show of devotion to piety. The last-named writer says:—"The *horrid cruelties* they committed were such as must have inspired the Turks with the most invincible hatred of them, and made them resist with the greater obstinacy. When Jerusalem was taken, not only were the numerous garrison put to the sword, but the

inhabitants were massacred *without mercy or distinction*. No age nor sex was spared, nor even sucking children. According to Voltaire, some Christians who had been suffered by the Turks to live in that city, led the conquerors into the most private caves, where women had concealed themselves with their children, and not one of them escaped. What eminently shows the enthusiasm by which these conquerors were animated, is their *behaviour* after this terrible slaughter. They marched over *heaps of dead bodies* towards the *holy sepulchre*; and while their hands were yet polluted with the blood of so many innocent persons, they *sung anthems to the common Saviour of mankind!!!*"

Lingard says:—"The next was the last day fixed by the treaty. The hostages were led to the summit of a hill, in sight of the Saracen camp. The Crusaders assembled in crowds to witness so glorious a spectacle, and at a given signal 2,700 infidels fell under the swords of their *butchers*. At the same time, an almost equal number, the portion which had fallen to the lot of the king of France, was *massacred* under the walls of Acre, by the troops under the Duke of Burgundy. Out of 5,000 captives, only seven emirs were saved, for the sake of exchange or ransom. Nor was this the end of the tragedy. The dead bodies were abandoned to the insults of the soldiers, who cut them open to discover the precious stones which it was believed they had swallowed, and carefully preserved the gall for medicinal purposes!" This is corroborated by Fuller:—"Yea, in his anger Richard commanded all the Turkish captives, 7,000 in number, to be put to *death* (except some choice persons) on that day whereon the articles should have been, but were not, performed; for which fact he suffered much in his *repute*, branded with *rashness and cruelty*, as the *murderer* of many Christians, for Saladin, in *revenge*, put as many of our captives to death. On the other hand, the *moderation* of the French king was much commended, who, *reserving his prisoners alive*, exchanged them to ransom so many Christians." Keighley confirms the same, and adds, "Thus, with a massacre which covered the king of England and the Christians in general with disgrace, terminated the siege of Acre." Mill says, respecting Edward,—“But he was not less cruel than any preceding hero of the

holy wars, and he gave a dreadful earnest of that *savage implacability* which Scotland afterwards so often rued. The barbarities which stained the entry of the Christians into Jerusalem two centuries before were repeated, in a smaller theatre of cruelty, in Nazareth." Again:—"The conquest of the seat of the Grecian empire was achieved, and the triumphant barbarians had the choice of mercy or revenge; but the ferocity to which they were indebted for success was not easily extinguished, and they abandoned themselves to the usual vices of conquerors. The scenes of *female violation* need not be described. The palaces of the rich, and the meanest houses of the poor, were explored for plunder by the cruel diligence of the victors. Their *sacrilegious hands* tore away the ornaments of churches, the coffins of the emperors were broken open, and the mouldered imperial vestments were stripped from the corpse of Justinian. Their destruction of the rich and beautiful church of Sophia would pass as an ordinary circumstance in the history of sieges; but the annals of profanation have seldom presented us with an instance of a vulgar courtesan, the priestess of the furies, seating herself in the chair of the patriarch, and singing a bacchanalian song to the corresponding actions of the surrounding soldiers and mob. The Marquis of Montferrat and the French and Venetian ecclesiastics prayed and threatened their companions; but the voice of reason and religion could not abate the storm of the passions. Nothing was so difficult as to soften the ferocity of these barbarians and to gain their affections. They were so irritable that a single word would kindle the flame: it was folly to attempt either to lead them or to make them hear reason."

These examples might be multiplied, but enough has been said on this part of the question.

It is gratifying to observe that there were in these barbarous days those who foresaw that the Crusades would be demoralizing, destructive to life and property, prejudicial to good manners, and repugnant alike to religion and common honesty. Mill says:—"Though pilgrimages were generally considered acts of virtue, yet some of the leaders of the church accounted them *useless and criminal*. Gregory, bishop of Nice in the fourth century, dissuades his flocks from

these journeys. 'They were not *conscientious obligations*,' he said; 'for in the description of persons whom Christ had promised to acknowledge in the next world, the name of *pilgrim* could not be found.' A migratory life was dangerous to virtue, particularly to the modesty of women. Horror at spectacles of vice would diminish with familiarity, and the moral principle would gradually be diminished. Malice, idolatry, poisoning, and bloodshed, disgraced Jerusalem itself; and so dreadfully polluted was the city, that if any man wished to have a more than ordinary spiritual communication with Christ, he had better quit his earthly tabernacle at once, than endeavour to enjoy it in places originally sacred, but which had since been defiled. Some years after the time of Gregory a similar description of the depravity of Jerusalem was given by St. Jerome, and the Latin father commends a monk, who, though a resident in Palestine, had but on one occasion travelled in the city. The opinions of these two venerable spiritual guides could not stem the torrent of popular religion. The coffers of the church were enriched by the sale of the relics, and the dominion of the clergy became powerful in proportion to the growth of religious abuses and corruption."

The general results of the Crusades are thus summed up by the authors already quoted; but, as I observed before, I give the principal features of the wars, and it will be for my readers to draw their own conclusions, and to determine in their own minds whether good or evil resulted from them. At the same time, the *finale* of the authors following is entitled to grave consideration, inasmuch as the reasoning is consistent and concordant with the facts of the case. Fuller, who is favourably disposed towards the war, says, "The French proverb was verified of this voyage, 'Much bruit and little fruit.' They (the Christians) not only did no good in the Holy Land, but they did much harm. Thus, after one hundred and ninety-four years, ended the war, for continuance the longest, for money spent the costliest, for bloodshed the cruellest, for pretences the most pious, for the true intent the most politic, the world ever saw." Of the latter phrase let my readers judge.

Another writer (Keighley), alike favourable, says:—"Though the Crusades certainly did not produce all the good imputed to them, they may have produced some; and though

it is not just to deprive them of all redeeming qualities, we must concede that they had in them a sufficient alloy of evil to neutralize much of their good." Whether the writer be really sincere in adding that "it is not just to deprive them of all redeeming qualities"—whether it proceed from a deep conviction, evoked by a study of the wars only, or whether he says it out of compliment, I cannot determine; but certainly the latter appears to me to be the probable motive.

Lingard says:—"The only benefits which the nation received in exchange for the immense sums with which it had furnished the king (Richard) in his expedition to Palestine, for his ransom from captivity, and in support of his wars in France, were two legislative charters, one establishing uniformity of weights throughout the land, the other relating to wrecks, which provided that the cargoes of a ship were recoverable if the sons or daughters of the owner, or, in default, their brothers and sisters, existed, in preference to the crown."

The results of the holy war, as regards the power of the feudal barons, the spiritual authority of the clergy, the progress of "civilization and moral well-being," and the general effects on the times which followed, are thus eloquently and cogently summed up by Mill:—"The origin and history of the fanatical and military enterprises, called the Crusades, have been traced. No religious wars have ever been so long, so sanguinary, and so destructive. Countless hosts of holy warriors fell the victims of their own vindictive enthusiasm and military ardour. Fierceness and intolerance were the strongest features in the character of the dark ages. It was not for the conversion of people, or the propagation of opinions,* but for the redemption of the sepulchre of Christ, and the destruction of the enemies of God, that the crimson standard was unfurled. Men did not arm themselves from any conviction that the co-existence of Christendom and Islamism was incompatible with the doctrines of the Koran, or that the countries of the West would be precipitated into the gulch of destruction if Asia Minor were not torn from the hands of the Turks and restored to the emperor of Constantinople. The floodgate

* How does this accord with the assertion of C. W., Jun., that it was "the emancipation of the human mind?"

of fanaticism were unlocked for the savage and iniquitous purpose of extermination.

"The question of the justice of the holy wars is one of easy solution. The Crusaders were not called upon by heaven to carry on hostilities against the Mussulmans. Palestine did not of right belong to the Christians in consequence of any gift of God; and it was evident, from the fact of the destruction of the Temple, that there was no longer any peculiar sanctity in the ground of Jerusalem. There is no command in scripture for Christians to build the walls of the holy city, and no promise of an earthly Canaan as the reward of virtue. On principles of morals and politics, therefore, the holy wars cannot be justified. If the Christians had been animated by the conviction that war with all the world was the vital part of Christianity, then also a right of hostility would have been raised (to the infidels). But, before they could have been justified on this last-mentioned argument, proof is necessary that the danger was imminent, and that time and circumstances had not reduced the principle to a mere dry imperative letter of the law.

* * * In tracing the history of Europe in its progress from civilization to refinement, and in accounting for the various phenomena of the moral world, the philosophical observer of man reverts with anxious seriousness to the Crusades of the Latins in the East. These transmarine expeditions so deeply convulsed the moral fabric of the West, they stand so prominent in the picture of former ages, that curiosity is awakened whether they left some lasting impression of good or evil. In the two hundred years of their continuance Europe was making slow and silent advances in arts and civilization, and there were great changes of scene in the political theatre. Viewing, then, the natural union between principle and event, and guarding ourselves against the error of confounding chronological coincidences with moral connexions, the inquiry is to be made into the consequences of the holy wars. A stamp of permanency was fixed on popular superstition when pilgrimages became a matter of public concern and national interest. These religious journeys were only consistent with the christian character when they were performed in harmony with great and primary duties. They might have been considered the ornaments of a religious life

if they had proceeded from holy sympathy; but, when their essential merit was made to consist in the destruction of men and trampling on the law of nations, their natural tendency was to indurate the heart and brutalize the character. The fair face of religion became besmeared with blood, and heavenly attraction was changed for demoniacal repulsiveness. The Crusades encouraged the most horrible violences of fanaticism, and the precedent for the military contentions of the church with the Prussians and the Albigenses; and, as the execrable Inquisition arose out of the spirit of clerical dragooning, the wars in Palestine brought a frightful calamity on the world. The pastors of the church used anathemas, excommunications, interdicts, and every weapon in their storehouse of spiritual artillery; and, when the world was in arms for the purpose of destroying infidels, it was natural that the soldiers of God should turn aside and chastise other foes to the true religion. When offences were commuted for money, the religious application of the price of pardon soon ceased to be necessary. Absolutions from penance became a matter of traffic, and holy virtues were discountenanced.

* * Undoubtedly, the Crusades augmented the wealth of the clergy. The rapacious barons frequently plundered the clergy; and when, afterwards, they were brought to such a sense of religion as to resolve on a holy war, the restitution of ecclesiastical property became a necessary preliminary proceeding. The ecclesiastics flourished more vigorously than any other men; they took a high rank in society, and purchased the birthrights of rash, fiery enthusiasts, who tried the hazard of fortune in the Holy Land." After stating that Europe, had she enjoyed peace during the temporary absence of the great mass of her people, it was "because the horrors of civil war were stayed," he proceeds to add—"But afterwards civil and national hostilities raged with unceasing and unrelenting fury; and, moreover, the spirit of the Crusades fanned the flame of military daring." Referring to the charm in the expression, "days of chivalry," and the suggestion that chivalry "dissipated a cloud of ignoble passions, and transports itself (that is, the fancy) to those remotest ages, which it gilds with the virtues of honour and courtesy, he proceeds to say:—"On the fair part of ancient warfare the Crusades cast a baneful influence.

That tenacious and delicate regard to veracity, which was a great characteristic of the true knight, must have lost much of its sensitiveness by the habitual and systematic violations of faith with infidels. A liberal treatment of prisoners was another remarkable point in the chivalric character. So firm was the trust of cavaliers in each other's honour, that it was common for a victorious knight to suffer his captive to return to his own country in order to collect his ransom; but (in Asia) bigotry and cruelty were the ruling passions of holy warriors. The soldiers of the cross had all the heroism, but none of the polish, of knight-errantry; and the sword leapt from the scabbard, not for the generous purpose of avenging the looks which threatened beauty with insult, but for the vile and rude office of striking off a Saracen's head. * * * We are unaccustomed to think that the national and civil hostilities which raged in the West during the middle ages were favourable to intellectual cultivation, and it would be as difficult to prove that the holy wars were beneficial to Europe, by rousing it from intellectual torpidity and strengthening or refining the tone of mind. They were times of action rather than of letters. They excited a cruel and savage cruelty, and lighted the consuming fires of superstition. Spoliation and slaughter were accounted the highest pitch of human glory, and therefore all that most merited fame was in silence hid. Modes for their destruction, not for their amelioration, occupied the minds of the Christians. The humble and unobtrusive virtues of peace, and their long train of useful and elegant arts, were not fostered, for tranquillity was perpetually broken in upon; the leaders of opinion made the duty of war their greatest theme; and, when the indulgence of their ferocious passions became sanctified, no desire could be felt to emerge from rudeness and ignorance. Much has been written on the supposed advantages to Europe of the collision of minds produced by the mixture of the various nations of Christendom in the course of the Crusades. The connexion between different states was so short and occasional that national prejudices were not softened, political varieties obliterated, or mutual knowledge interchanged. At the close of the Crusades the nations of Europe were as much separated as they had been at

the commencement. Religion had united them for a while, but the bond soon was broken, and the world returned to its former state. But, if the pilgrim ever steps out of his course, it is only to collect with holy reverence those relics which his idolatrous fancy has sanctified; and the mere soldier can imbibe no ideas except those which are connected with his professional habits. The letters that enlighten, the sciences that improve, and the arts that polish life, are not in the intellectual sphere of either. * *

"The last point of inquiry into the consequences of the holy war concerns their effect on the political relations of the great European states. As the Crusades were carried on for holy objects, not for civil or national ends their connexion with politics could only have been collateral and indirect. The spirit of crusading, composed as it was of superstition and military ardour, was hostile to the advancement of knowledge and liberty, and consequently, no improvement in the civil condition of the kingdoms of the West could have been the legitimate issue of the principles of the holy war. Great changes in the political aspect of Europe were coeval with, but were not occasioned by, the holy war. The power of the French crown was much higher at the end of the thirteenth than it had been at the same period of the eleventh century; but the influence of the imperial throne was materially depressed. These opposite effects could never have been the results of the same cause, viz., the loss of the flower of the western aristocracy in Palestine. The pusillanimous John assumed the cross; but the circumstance did not occur till after he had surrendered his crown to the papal see, and until the barons had formed a confederacy against him."

After stating that the great political event of the thirteenth century was the establishment of free and corporate towns—that this was not owing to the Crusades—he says:—"Whenever any part of the public became more rich and enlightened than the rest, the tyranny of the aristocracy was found to be insupportable. The kings of France and England eagerly assisted the burghers of their respective countries, and enfranchised the towns in order to raise a barrier against baronial aggressions on the throne. After various vicissitudes of fortune, the battle of Legnano and the peace

Constance established the independence of the towns in the north of Italy. The Crusades did not contribute to these events, for the two sacred expeditions which had taken place were as disastrous to peasants as to princes, and drained Europe of all ranks of society; consequently, it was not from the holy wars that the people gained their liberties. We find that, so ill regulated was the liberty of the towns alluded to, anarchy soon succeeded. Men of personal importance and wealth aspired to sovereign honours, an overwhelming aristocracy extinguished freedom, and at the end of the thirteenth century there were as many princes in Tuscany and Lombardy as there had been free towns at the end of the twelfth."

My task is now completed. I have traced the rise, progress, and termination of the war, and have exhibited the Christians' professed and actual conduct. As the *tout ensemble* had an influence for good or evil, taking into consideration the immense sacrifice of life and property, the impediments created to commerce, civilization, and Christianity, the numberless evils generated, and the consequent barrier thus raised against progress—were such effects likely to assist the moral well-being of the people? or were degradation, misery, and disgrace more probable? If my readers should possibly assume that the former be correct, it would be well to enquire if such good results followed as a natural consequence from the holy war, or whether they were collateral or indirect? if the latter, then the affirmative of this question cannot with justice be maintained, for its supporters will hardly venture to contend that their position is tenable when the good is merely accidental, and when it will not always flow from the same circumstances and from the same springs of action. In dealing thus "liberally" with this question, it will be seen that I have preferred to lay the moral facts and historical data of the Crusades before my readers, and thus enable them to form their own conclusions. By examining the conduct of the Christians, the motives which impelled them to act in concert, as well as by tracing their ruling passions and marking their diplomacy, a correct opinion may be arrived at. For my own part, I consider it derogatory to truth and good sense to place particular credence in mere quotations, in which certain effects

are merely asserted, *without making a comparison between the actual facts and assumed consequences.* It is too much the fashion, as Dryden says, to take on trust the evidence of historians, without *searching for ourselves* in order to ascertain the probability of certain influences.

Speaking on my own behalf, the contemplation of the holy wars is serious and instructive. It affords ample illustration to future generations of the utter folly of war being considered as a boon, or even as the arbiter of disputes. The holy war originated in a superstitious reverence for relics, both of locality and the seemingly less important articles of bones, clothes, wood, &c. Although it would be unjust to deny that many engaged in the warfare who were prompted by pious and holy feelings, yet the extracts show that a love for military glory, in combination with a despicable hatred of the infidels, animated the great mass of the Crusaders. Cruelty and bloodshed frequently stained their banners, when it would have been more christian and humane to have spared the defeated. They pursued a course which was detrimental to their own interest, repugnant to religion, revolting to humanity, and lamentably discreditable to Christendom in its consequences. They imbrued their hands in innocent blood, and then called upon God to bless and countenance the bloody deed. Whilst professing to adorn the "gospel of God their Saviour in all things," whilst preaching and commending christian virtues and duties, they outwardly showed an utter disregard for morality and decency, and, under the guise of hypocrisy, perpetrated the most cruel and reprehensible acts. That such conduct could have any influence but for evil on the infidels there can be no doubt, and the entire loss of the Holy Land is, perhaps, the most pregnant illustration of their dissolute conduct, and was a just retribution as well as a warning to future generations of the folly and madness of proclaiming, but not acting in unison with the dictates of Christianity. It cannot but be natural to suppose that a continental people, or a combination of professing Christians, visiting, for religious purposes, a foreign country whose inhabitants were infidels, would have their characters examined and a comparison instituted between their creed and conduct; nor is it less natural to surmise that the Chris-

tians would be as eager in being circum-spect and deliberate in their conduct as the infidels in gratifying their curiosity. But it was not so in this case; consequently the immorality and licentiousness which the Christians imported into Asia were not very creditable to the christian religion. Christianity was blighted by its own professors, and the very unfavourable contrast which existed between the two only served to render the former more contemptible in the eyes of the world, and the latter less worthy of respect and admiration.

A short comment on the concluding remarks of C. W., Jun., and I close, craving the pardon of my readers for this lengthened paper. He has certainly avoided a difficulty which he could hardly solve, when he says, "It would answer the present inquiry simply to show that in the end no real harm ensued. But we prefer to deal *liberally* with the question." As if discovering (in his own mind) that this could not possibly be substantiated, he coolly takes it for granted that his readers are aware of the circumstance "that in the end no real harm ensued," and thus very discreetly avoids entering into a topic, the discussion of which would involve him in the "horns of a dilemma," which would eventually expose the weakness of his argument, the fallacy of which he is conscious, and has not the courage to avow. And, as if viewing with derisive scorn the feelings of those who revolt at cruelty, he says:—"Lastly, there are those who become so completely absorbed in the contemplation of the horror and misery which naturally attended such perilous expeditions that they entirely overlook the final result. 'Look,' say they, 'at the immense sacrifice of human life! See the immense amount of property, and the consequent amount of misery and destitution which must have followed!'" And, as an apology for this, he makes the following unblushing exclamation:

tion:—"Remember, reader, however much you may deplore the fact, that in the early progress of European civilization and liberty you have the din and horror of war ever ringing in your ears." Is this any justification for the conduct of the Christians? or are we to sit down, consoled with the fact, that because, "in the early progress of European civilization we have the din and horror of war ever ringing in our ears," we must excuse the Christians on the same score? Is this the plea set up for forgiveness, or are we, forsooth, to accept C. W., Junior's doctrine of justification? Are we still to continue confirming the old adage, that "like begets like;" or, because I knock C. W., Jun., down, is that any justifiable reason why he should act similarly to me? Away with such arguments; no apology can be accepted for deeds done in cold blood, and when the blessing of the Almighty was invoked on such cruelty. I can take into consideration the character of the times; nevertheless, christian charity and forbearance were well understood even at that period. "They that take the sword shall perish by the sword;" and most assuredly as the Christians were the first to appeal to that weapon, this solemn though emphatic declaration was fulfilled against them in all its severity. They transformed benevolent feeling into furious and demoniacal passions; but

"They err who count it glorious to subdue
By conquest, far and wide—to overrun
Large countries, and in fields great battles win
Great cities by assault. What do these worthies
But rob and spoil, burn, slaughter, and enslave
Peaceable nations, neighbouring or remote,
Made captive, yet deserving freedom more
Than those their conquerors, who leave behind
Nothing but ruin whereso'er they rove,
And all the flourishing works of peace destroy
MILTON.

Gentlemen of the Jury,—What say you
to the Crusades?
J. G. R.

Philosophers have puzzled themselves how to define man, so as to distinguish him from other animals. Burke says, "Man is an animal that cooks his victuals;" "The says Dr. Johnson, "the proverb is just, 'There is reason in roasting eggs.'" Dr. Adam Smith has hit this case. "Man," says he, "is an animal that makes bargains: no other animal does this. One dog does not change a bone with another."

Politics.

SHOULD NATIVE PRODUCE AND INDUSTRY TO BE PROTECTED BY LEGISLATIVE ENACTMENTS?

NEGATIVE ARTICLE.—II.

In these days of bold speculation and extensive enterprise, when charts of the world are as familiar as county maps, and science persuades the distant hemispheres to fellowship, we must not examine questions of universal interest in the manner of old ladies peering through spectacles. Free trade and protection are not peculiar terms of English phraseology; they express ideas which interest every nation upon earth; and if we think that by excluding from our discourse all reference to foreign influences we can secretly monopolize the advantages of commerce, we shall presently learn that there is an experience on such matters wider than that of the platform. The best precaution against deception in the consideration of fundamental questions of importance, is a simple and comprehensive examination. Arguments held in a corner about intricate trifles perplex the mind: sophistry is never so successful as when it inveigles an opponent into minute discussion. In order to avoid such danger, we push our way through conflicting statistics to seek elementary truth.

Wealth consists of the produce of the earth, gathered, combined, and cultivated by the industry and ingenuity of man. The amount of the produce is proportioned to the fertility of the source and the expenditure of labour and skill. Those communities are the most wealthy which, favoured by local advantages, exercise an incessant industry, strengthened and guided by science. There are, indeed, instances in which entire populations are deprived of their due recompense by the oppression of power or the cunning of superior knowledge, but these are accidental exceptions, opposed to the tendency of the natural system; they will disappear at the approach of liberty and enlightenment, and will not be adopted in debate by those who prefer justice to the aggrandizement of dominant races.

There is no political district of the globe which can furnish, from its own territory,

all the necessaries of civilized life. The most favoured region must seek the luxuries of commerce. The whole world is thus connected by one interest, for since the universal produce is destined to a universal distribution, the general prosperity is identical with individual gain. Every circumstance, therefore, which tends to enrich the human family, deserves the approbation of the constituent members. Under a well-directed cultivation the bounty of the earth is adequate to satisfy a high civilization diffused through every continent. The greediness of protection implies a distrust of this providential goodness. It implies a selfish rapacity to appropriate a choice abundance, lest the horn of plenty should be prematurely exhausted. Hence arrives the absurd and iniquitous doctrine, at the root of every protectionist system, that Providence annually throws a scanty handful upon the earth, which is to be scrambled for, the prize of the most knowing and most powerful. Then follows the equally absurd corollary, that a nation is not happy in the possession of sufficiency while a neighbour flaunts in superfluity. Despising the fears of such extravagant husbandry, which would allow a whole continent to lie fallow, let us go on to consider in what manner the productiveness of all lands may be increased for the profit of all people.

The cultivation of natural advantages by communities corresponds to the division of labour among individuals. The same familiar arguments establish the efficacy of both. Resources are economized, perfection is attained, and production multiplied. There are few regions so destitute as not to furnish some staple peculiarity for the market of the world. Where the soil is barren, the mines may be rich, the waters prolific, the situation favourable, or the inhabitants persevering. The sterility of the ground may be compensated by ingenuity of mind; or, sometimes, fortune, enticed by accident, may be established by the precedent of custom. At least,

it is the wisest policy of mankind to encourage the production of useful articles in the hands to which they are indigenous, or in which they attain indisputable superiority, rather than by clumsy expedients to attempt to supersede them. A large and steady demand for any commodity tends to the improvement of its quality and the reduction of its price; and whether it is advantageous to obtain things plentiful, cheap, and good from the distance of our planet's diameter, in preference to the dear and villainous substitute of the shop round the corner, may be safely left to the decision of an old-fashioned housewife. Countries rich by nature, whose inhabitants can think hard and work hard, will support their pre-eminence with ease, and obtain the luxuries of every climate, in exchange for their coveted goods. Countries poorly endowed will gladly purchase, at a low price, the commodity they despaired of obtaining until the genius of commerce brought it to their shore. The entire world—those who sell and those who buy—will mutually benefit; not, as simple folks believe, at the expense of one another, but at the expense, so to speak, of the all-giving earth, stimulated to new generosity at the prayer of industry.

Against the promising simplicity of this scheme patriotism erects itself, exclaiming that native industry will be annihilated and the country ruined. How a country can be ruined by buying cheap instead of dear goods is somewhat paradoxical, since the difference in price is a clear profit on every item of purchase; or how a country whose industry is annihilated, can gather enough money to pay for foreign importations, throws suspicion upon its honour. Commerce is the very embodiment of *quid pro quo*: there must be an error in the patriotic argument, since it reduces itself to an absurdity.

Foreign competition can scarcely destroy native industry in its own home, unless there be such an original disproportion in the capacity of the rivals as to make the victory of the foreigner an advantage to them both. Most countries, as we premised, have pretensions to superiority in one or more productions which should form the substratum of their merchandize. Many of the necessities of life, and articles of minor consumption, are produced with such equability of cost throughout the world, that the attempt

to supplant native industry would be vain. Further, convenience, the influence of habit, and even pride, will retrieve the slightly fallen balance, and give to home-made goods, though a little extravagant, a preference over the goods of the stranger. From these causes foreign competition will not permanently prevail, except upon terms too advantageous for the purchaser to grumble. The defeated native had, perhaps, been accustomed to exorbitant profits, and deserves his fate: otherwise he must economize, employ more skill, take advantage of the benefits which a consistent free trade opportunely offers to himself, and, if these endeavours should fail (which experience declares they seldom have done), he must transfer his capital to another occupation; at any rate, his individual misfortunes, retrieved or hopeless, must not taunt with injustice the thousands who have gained by the discomfiture of his domestic monopoly.

The patriot, again, objects that free trade may place a country at the mercy of an enemy for the supply of its subsistence or the materials of its manufacture. But it must be borne in mind that free trade, when its success shall have been practically demonstrated, will make converts. Universal free trade will place every nation in one category; the same terror will hang over every head and persuade a reconciliation. The extreme supposition requires the correspondence of extreme circumstances. A country would seldom be embroiled with the four quarters at once; what an enemy refused, a friend might supply; and, finally, we recur to our assertion, that the cost of the production of staple food, when at its natural level, does not vary sufficiently to induce the belief that populous nations will ever trust their subsistence wholly to foreign supplies. Nor, while war continues a probability among mankind, is it likely that ministers of war will place the national commissariat in such jeopardy.

Protection starts with the assumption that there are no houses in the street but its own. It overlooks the political axiom, that commerce is mutual, and will flourish only while advantage is reciprocal. It is a great selfish error, which excites vexatious recrimination yet hopes, by a well-contrived tariff, to overreach its neighbours. The falsity of its principles is apparent from the consideration

that the prosperous thrive at the expense of the unfortunate. The quantities of the equation are simply shifted from *minus* to *plus*, from *plus* to *minus*. Protection is wasteful; for what is the essential operation of any undue tax but to divert capital from its original busy destination, to place it in the idle hands of wasteful governments, fine gentlemen, and luxurious monopolists? Whatever tax is not expended upon objects of utility, is, in the view of political economy, so much power thrown away. Protection, in the abstract, is a sham, which presumes to have amassed wealth because it has concentrated it in heaps. These heaps want to be scattered; there can be only partial germination till the sun of free trade sheds its warmth upon every atom.

The article of correspondent A., to the surprise of the reader, resolves itself into one argument—that the English people, possessing industry and an inquiring spirit, being famed for untiring toil, and assisted by inventions, require the further protection of legislative enactments. This is an honest John Bull blunder of a past age. It belongs to the era of the French war, King George, and top boots. Correspondent A. must have fallen asleep when the policy of Pitt led the nation to ruin, from which it was saved by extraordinary resources developed by the accidents of science. He wakes in the days of the policy of Peel; he beholds unexampled wealth, more equitably distributed, dominion extended, and power consolidated. The interval has elapsed in unconscious slumber; he attributes the consequences of to-day to the antecedents of fifty years ago. While he has slept, a great change has affected social institutions and national relations. Opinions have adapted themselves to the altered circumstances; the world looks forward, and not hindward as it used to do, and pursues destiny, instead of being driven by it. Among other speculations, an opinion is abroad that nationality is a remnant of barbarism, which, having bestowed its rude benefits upon the world, must accept the gratitude accorded

by philosophical historians to the Crusades and the feudal system. It has been discovered that nations, like the Olympic charioteers, endanger their own safety by malignant rivalry upon a narrow road. These opinions are yet in the bud, but they are quickly expanding beneath the breath of an irresistible experience. In England, at least, the old yeoman superstition, "Let us first be Englishmen," is receding before the faith that we are first human beings. Manchester spinners, on the brink of starvation, cling to common sense, and leave to the ridiculous three described in the fourth letter of the Citizen of the World, the honours of patriotism. When the time shall have come that the whole inhabitants of the globe, like a cordial family, shall reciprocate the scattered blessings of Providence, in the fulness of universal prosperity, how insignificant will appear the antiquated claims of national pre-eminence! Who, when the feast is at its height, regards the quaint armour that embellishes the convivial hall? The greatness and the happiness of a people are not correlatives. No sober-minded man believes it; but the protectionist legislator generously assumes the responsibility of starving a kingdom for the sake of making it "loved at home, revered abroad." With what result, let the past history of the people declare.

In this brief exposition of our opinion we have rested the claims of free trade upon the broad principle of fellowship. Unity is strength as well in peaceful as in warlike transactions. We are aware of the excuses which are suggested by the discordant aspect of the world. But the apparent disunion of governments must not be mistaken for want of sympathy among the people. Besides, free trade is young; the demonstration of its benefits, even upon a partial trial, is limited to the experience of a few countries. Let a full development discover its worth; and if some governments are obstinately blind to conviction, let the system be mutual among wise nations, to the qualified exclusion of the unsociable and selfish. H. T.

AFFIRMATIVE ARTICLE.—II.

Among the political questions which have of late years agitated the land, none has been more obstinately debated than the propriety of a change in our late commercial policy.

The previous questions which had engrossed the national attention—Catholic Emancipation and the Reform Bill—had for their object the granting of legislative power to classes

hitherto unenfranchised, and the consequent diminution of the influence of those who were formerly its sole possessors. With such prizes at stake, it cannot be wondered at that the contest was vigorous and protracted; but, on the question of protection, no motives were avowed which could account for the tenacity and zeal with which it was attacked and defended. A philanthropical motive—the wish to provide cheap food for the poor—was the only inscription on the banner of free trade. It may, perhaps, be uncharitable to suspect that the real motive of the agitators was the same as in the other political contests—the elevation of themselves and their order by the depression of the landed aristocracy; but it certainly does seem strange that men belonging to a class not celebrated for tenderness or consideration for their subordinates, should have been induced, by their benevolent feelings alone, to spend thousands of pounds in procuring cheap food for their poorer neighbours. But as, of course, the right or wrong of any question must be decided on its own merits, without regard to the motives of its assailants and defenders, I shall now endeavour to prove that protection in England was both just and expedient.

And, first, as to its justice. It is, obviously, the duty of every community to see that each of its citizens, with regard to commercial advantages, shall be placed on at least equal terms with foreigners, and that no class shall be depressed for the sake of a momentary advantage to the rest of their fellow-countrymen. To be just, protection must be proved to be in accordance with these principles. In a new and lately-settled country, whatever restrains the freedom of trade is injurious. The taxes being generally insignificant, and the population scanty, any protective duty can only cause capital and labour to be diverted from their legitimate channels. But in an old-established, populous, and wealthy state, where taxes are high, living costly, and profits reduced by competition to a very small per centage, there will always be abundance of capital and labour for every prudent speculation; and it then becomes necessary for the government to interfere to prevent the lightly-taxed and cheaply-paid foreigner from underselling the heavily-burdened native producer. Though this may increase the price of the

article protected, yet it is no robbery of the many for the benefit of the few; it is merely a means to prevent those burdens which should be borne by all from weighing too heavily upon those whom their pressure has disabled from competing on equal terms with strangers.

When we consider the causes of the decline and fall of most commercial states, I think the expediency of protection will be as evident as its justice. They have generally been—the destruction of the smaller capitalists, the proximity of great wealth to great poverty, and the preponderance of the commercial over the territorial interest. Protection to every branch of native industry is an antidote to the first two of these evils; to the last the duty on foreign corn affords a check. By protecting the smaller manufactures in this country, the glovers, the bootmakers, the hatters, &c., we are both rescuing an honest and respectable set of men from poverty, and preventing the absorption of the small capitals employed in these trades into the hoards of the mill-owner. If, however, by the admission of low-priced foreign goods, we destroy this middle class, we do not benefit the working class. Food and clothes may, indeed, be cheap, but wages will be cheap also. The hands formerly employed in these ruined trades being thrown on the labour market, naturally lower the rate of remuneration, till it reaches the lowest sum on which starvation can be prevented. It may be said that free trade opens out fresh markets, and thus, by giving additional employment, keeps up the price of labour. This might be true if all nations consented to adopt free-trade principles; but we do not find that our adoption of them has induced others to imitate our example. We fancy, because we are a commercial nation, that the great ambition of foreigners is to exchange their corn, cattle, brandy, and wine, for our calico goods and broad-cloth. But we are mistaken, especially as to the continental powers. France, for instance, would not give up the hope of revenging Waterloo and the double occupation of Paris for any commercial advantages we could offer her. Free trade is not the cause of our present prosperity: it has not opened to us a single market which we did not possess before. It has, certainly, cheapened food; but it would likewise have

cheapened labour, if a vent for our surplus population had not been discovered in California and Australia. We have also had a succession of good harvests, which have, in some measure, lessened foreign competition with our farmers. But we cannot always expect to be fortunate. Let the tide of emigration stop; let there be one or two bad harvests; let there be a general European war—none of which events, especially the last, are by any means improbable—and we shall reap the disastrous fruit of our imprudence. With wages at starvation point, their best customers—the landholders and middle classes—ruined, the foreign markets closed to them by another treaty of non-intercourse, fierce and hungry mobs clamouring for that food for whose supply we have become dependent on our foes, our manufacturers will then have time to regret the infatuated and grasping avarice which

induced them to consent to the destruction of their most constant and largest consumers, in the vain hope of monopolizing the trade of the world, and the misplaced confidence that, if we made large concessions to foreigners, they would be equally ready to reciprocate. Protective principles—those principles which teach us to prefer our own country and countrymen to foreigners—carried England with honour and success through the most costly and protracted war of ancient or modern times: it remains to be seen whether, under similar circumstances, free trade would do the same. The crisis has not yet arrived; but its distance no one can predict. God grant that, when it comes, England may not share the fate of her predecessors in commercial greatness, whose wealth has been their weakness, and their insatiate cupidity its own punishment.

S. A. J.

Social Economy.

IS THE CONFESSIONAL IN HARMONY WITH INTELLECTUAL AND MORAL FREEDOM OR SOCIAL WELL-BEING?

NEGATIVE REPLY.

We must say we delight in the intellectual discussion which debate affords, yet in our ardour we would not wrest the truth for the sake of degrading any subject, nor would we knowingly suffer our judgment to be misled by preconceived notions: the remarks of X. on this point are apposite, but too exclusive; he seems to think that the writers on the negative only are subject to party feelings, and perceives not that he himself yields to them in the same paragraph.

C. C. F. has replied so fully and so ably to the attempt of "Confessarius" to graft the confessional on scripture, that we need not pause to combat again his arguments on this point. We shall address ourselves to the arguments offered by the other writers, and we may incidentally have a word with him. "The confessional," says J. B., "is an institution coinciding with a law of our nature." To this assertion we cannot assent. There is some truth in his after remarks, when he alludes to the relief experienced in the un-

burdening of the soul to those in whom we confide, but that surely affords no pretext for the establishment of a *public* confessional—a regularly organized institution, in which the entire inhabitants of a parish confide in one man, and that man armed with authority to compel those, under penalty of excommunication, to reveal to him their sins, and who claims to be invested with power to remit or retain these sins according to the pleasure of his own will. In the one case confession is optional, and made for personal satisfaction only, to one who we are sure feels an affectionate interest in our welfare; in the other it is obligatory—is associated with future rewards and punishments, and made to one who cares not for our personal confidence: the differences are too grave to secure belief in the proposition, that the tendency to confess to one another is the reason for its establishment.

Further on he says—"A candid confession allows a person a starting-point for a new

course of moral rectitude; he is a 'new creature;' he has done with the past, and the future may be full of hope." This certainly is an attractive aspect of confession, and would be uncommonly convenient; but if intended to apply to the confessional, it is a merely fanciful speculation: so far from the confessional being an institution calculated to promote and maintain sinlessness of soul, it serves merely to cozen the confessed into forgetfulness of sins which otherwise might be a source of mental anguish; as the conservator of conscience, it ought to be a check on violations of moral and religious duty; yet, in contrasting non-confessing countries with countries in which the confessional is attended, the result, despite the special pleadings of Bishop Maginn, is highly flattering to the former, and presents an irresistible proof that the principles in which the confessional is founded are erroneous. That attendance at this tribunal does not conduce to "newness of life," is a fact painfully illustrated in the experiences of Roman Catholics. No sooner do they leave the tribunal than they relapse into their former habits, and so continue sinning and confessing their sins from year to year, without any amendment of heart being effected. In the primitive church, when a member sinned so as to lose communion, he was not readmitted until assurance was given, by a long course of irreproachable conduct, that a permanent improvement had taken place; but in the Romish church the penances, consisting of a vain repetition of psalms and paters, or it may be a pecuniary consideration, affords no certainty that amendment has been superinduced; indeed, the penance is so inadequate to the offence, that the passions are not restrained by fear of punishment. He who perceives that he has infringed the divine command will, if he be sincerely repentant, change his mode of life without the interposition of a confessor: the penitence which such inspire, whether by censure or rebuke, by exhortation or expostulation, may be violent at the time, but it is quite unfit to be accepted as a reason that the sins committed should be forgiven, even granting that that functionary does possess the power to remit or retain which he claims to have had delegated to him. He must be credulous to an extraordinary degree, who can believe that those who have life long been accustomed to

confession and absolution, are, on each occasion, duly inspired by a sincere repentance or a genuine love of God. The confessions made, it is to be feared, are but partial revelations; those delinquencies to which the penitent is attached are in danger of being concealed, as also such as are darkly complexioned and stain the moral character. Whatever a man's character may appear to be, he is himself conscious of many specks upon it of which the world is ignorant; and so it is with the penitent, his confessor does not know all: notwithstanding the man's knowledge that concealment is sacrilege, that self-respect of which he cannot wholly divest himself (and which if he could, society would be deprived of its surest guarantee for his conformity) prevents him from humiliating himself so far as to unbecom every dereliction of duty, more especially such as tend to lessen him in the estimation of others; thus wavering between the instincts of nature and the fancied claims of a fictitious duty, he is accustomed to stifle conscience, and he becomes gradually hardened by this course of concealment. Such is the natural result of the confessional. Its inutility is shown in the uncertainty to which class sin may belong: with an austere man, that may be accounted a grave offence which, with a man of easier disposition, would be considered trivial. And, further, it is inconsistent in its terms; for we are told that absolution is valid only after a minute and "circumstantial declaration of every sin;" and history records that whole armies, *en masse*, have been absolved without any such declaration.

"It is impossible it (the confessional) ever could have been established in the christian world but by the command of Almighty God himself," or "to assign any other beginning to it than that of Christianity itself:" such is the inconsiderately bold language indorsed by X., while the historical fact is, that previous to 1215, there existed no recognised public confessional, and that at that date a most important change was effected; till then absolution had been dependent on the performance of penance; since then "forgiveness attends the act of confession." It was owing to this change that auricular confession, which has conferred so much power and influence on the church, was adopted. Considerable address was mani-

feasted by the Lateran council in decreeing absolution to follow confession, who rightly reasoned that men would submit with less reluctance to the change, if by it they secured an immediate instead of a prospective pardon. At this period "the Roman church, having become preponderant from her numerous usurpations, aimed only at extending her dominion. By imagining a new system of confession and penance, by augmenting the catalogue of sins, and modifying their nature, and by reserving to herself the right of giving or refusing absolution, she has grasped at the consciences of nations and of kings. For this purpose it was necessary to render pardon as easy as sin is attractive."* Its introduction is merely another instance of the ecclesiastical hardihood of popes, and does not transcend their accustomed arrogance. It was not until confession was exalted to the dignity of a sacrament, that Rome assumed that lordship over conscience which results in the excommunication of sovereigns, the establishment of inquisitions, and the moral enslavement of the peoples over whom her sway extended; and had it not been for the imbecile policy of the continental governments, that cherished it as a means of checking sedition in the germ, it had not survived till now to "blast the human flower."

The question is asked—"Is the confessional in harmony with intellectual and moral freedom?" And we cannot reply more fittingly than by asking, in return, whether he can enjoy intellectual and moral freedom who suffers himself to be cajoled by intimations of a priest—whose mind is burdened by restrictions and prohibitions—whose memory is tasked recollecting a multitude of observances, and treasuring up against the next approach to the confessional a catalogue of real and fictitious sins? Whether he is an intellectual and moral freeman who renounces his right of judgment in the most important concerns of his spiritual nature, and accepts as heaven-inspired truth every word which proceedeth out of the mouth of a priest? Whether he is intellectually and morally free who permits a court at Rome, or anywhere else, to decree what books he may, and what he must not, read? Is he

not rather in the depths of mental and moral serfdom, who dares not read his bible, unless he have a licence from a priest? No, "Confessarins;" it is by no means clear that the confessional permits us to "do as we choose," even although that be "associated with the determination to do as we ought;" we must do as the priest prescribes, and not what our own opinion of duty may dictate: for instance, to read Milton, or study Newton, would not, in the view of any sane man, be construed into a violation of duty; it so happens, however, that the works of both these illustrious sons of light, in company with those of many of our best writers, are comprehended in the expurgatorial list, to read from which is an unpardonable offence. The absence of restraint incites to activity, but when penance may be incurred by the study of subjects, unless under priestly sanction, men are discouraged from engaging in mind-invigorating pursuits. So far as regards intellectual growth, the Romish church has a grand antidote in the unreasoning faith with which she requires every tenet of hers to be accepted; her adherents are taught that they cannot discern truth for themselves; that the attempt is impious.

X. complains that "in regard to the relation of the confessional to social well-being much has not been said." We shall endeavour to satisfy him. That the church intermeddles with political affairs cannot be denied. Now, whatever movements it has interested itself in supporting or defeating, the priests have uniformly promoted or opposed, by granting or denying absolution according as their penitents favoured or retarded their views. We cannot forget the active part which the priests take in the Irish elections, nor the threats by which their parishioners are menaced should they dare to be refractory. We know that in the continental countries, when the interests of the church did not run parallel with those of the state, the confessors did not hesitate to improve the opportunities afforded by the confessional to inculcate doctrines subversive of the civil power, and to enjoin the formation of secret societies, compelling those who approached their tribunal to become members, by refusing absolution on any other terms, and binding them to secrecy lest their own seditious designs might be discovered. In reference to this subject we quote the following paragraphs from Vol-

* "Hist. of Aur. Conf.," by Count C. P. de Lasteyrie.

taire—an authority to which our opponents cannot object, for “Confessarius” himself has pronounced him to be “an impartial and true witness:”—

“The good which confession has done is, that it has sometimes procured restitution from petty thieves. The ill is that, in the internal troubles of states, it has sometimes forced penitents to be conscientiously rebellious and blood-thirsty. The Guelf priests refused absolution to the Ghibellines, and the Ghibellines to the Guelfs.

“The counsellor of state, Lénét, relates in his memoirs, that all he could do in Burgundy to make the people rise in favour of the Prince of Condé, detained at Vincennes by Cardinal Mazarine, was ‘to let loose the priests in the confessionals’—speaking of them as bloodhounds, who were to fan the flame of civil war in the privacy of the confessionals.

“At the siege of Barcelona, the monks refused absolution to all who remained faithful to Philip V.

“In the last revolution of Genoa, it was intimated to all consciences, that there was no salvation for whosoever should not take up arms against the Austrians.

“This salutary remedy has in every age been converted into a poison. Whether a Sforza, a Medicis, a prince of Orange, or a king of France, was to be assassinated, the parricide always prepared himself by the sacrament of confession.

“Louis XI. and the Marchioness de Brinvilliers always confessed as soon as they had committed any great crime; and they confessed often as gluttons take medicines, to increase their appetite.

“A fanatical assassin, thinking that he serves God by killing his prince, comes and consults a confessor on this case of conscience; and the confessor commits a sacrilege if he saves his sovereign’s life.”

Is it, think ye, “incapable of tampering with public liberty?”

The confessional assists in defeating justice. If a Roman Catholic has been guilty of any crime, and has confessed, he may with perfect truth, according to Liguori, declare before any civil court that he is innocent of the crime with which he is charged, because by confession the crime has been taken away.

It is needless to say that the oath is the recognised mode of arriving at truth in judicial proceedings. We nevertheless find in these theological works prevarications reduced to a science. How detestable, for example, is the morality inculcated by Liguori in the following extracts:—

“It is a certain and a common opinion amongst all divines, that for a just cause it is lawful to use equivocation in the propounded modes, and to confirm it with an oath.”

Again: “The accused, or a witness not properly interrogated, can swear that he does not know a crime which in reality he does know, by understanding that he does not know the crime concerning which, legitimately, he can be inquired of, or that he does not know it so as to give evidence concerning it.”

And further, in reference to all oaths—“Let them be ever so valid, they can be relaxed by the church.”

Now, we appeal to the judgment of our readers, whether teachings of this nature are calculated to promote the well-being of society, or whether, on the contrary, they are not certain to introduce a universal faithlessness?

The only means by which to gain an adequate idea of what this moral nuisance—the confessional—really is, is to peruse the works employed in training confessors for their duties; and yet this is a proceeding not to be hastily recommended. One may indeed become versant with the iniquities of the confessional, but in doing so the imagination sustains pollution without counter-vailing profit.

Judge, then, whether “the confessional is,” as J. B. asserts, “a sort of quarantine for the mind, by which it is purified from pestiferous contact with the world of sin.” We consider it, in the hands of unmarried men, educated as the priests are, as the most diabolical institution which has ever existed for the perversion of mind and morals. How truly did Paul foreshadow the nature of the institution under review! “The time will come,” he says, “when they will not endure sound doctrine; but after their own lusts shall they heap to themselves teachers, having itching ears; and they shall turn away their ears from the truth, and shall be turned into fables.”

ARISTIDES.

AFFIRMATIVE REPLY.

As one of the openers of this interesting debate we gladly avail ourselves of the right of reply, although our task will be very light, from the nature of the arguments used by our opponents, and the efficient services of the gentleman who followed us on this side of the question. And here we may observe, that it is instructive to notice how X., with a few bold strokes, utterly demolishes the fine-spun theories of "Aristides" and W. G. Verily, error may be potent, but truth is omnipotent!

The lengthened and laboured remarks of C.C.F. do not require much comment. His strictures upon our quotations of scripture are without point, as we would have it carefully noted that they were adduced by us rather to establish the *principle* of confession than anything else. That principle J.B. has, with much ability, shown to be in harmony with man's mental and moral nature; and we think even our opponent will admit that we have shown it to be sanctioned by the word of God. The question then comes, in what institution of the church is this principle embodied, if the confessional be abolished? We own our inability to say, and we would ask our readers if they can furnish a reply; if not, let those opponents who believe the confession of sins to be enjoined in the scriptures, tell us how that injunction is obeyed by the various sects of Protestants at the present day?

With regard to the bearing of the confessional upon social and intellectual well-being, we deem the dangers referred to by W. G. and others as more imaginative than real, and would refer to the evidence already adduced as to what the confessional has done, and what it has done. But our position here we may support by other considerations.

We are all well aware that the jealousy of the various sects is very highly developed, and that they keep a continually watchful eye upon the movements of those parties to whom they stand opposed. The more powerful the opposing party, the more jealous and strict is the scrutiny of their dealings. Now, the world there are tens of thousands of confessionals, the doors of which are almost continually open, affording the intending penitents free ingress and egress, and hun-

dreds of thousands of persons of both sexes pass these portals. Can we imagine, then, that the lynx-eye of jealous sectaries would not, long before this, have accumulated a ruinous catalogue of crimes, with full and particular proofs attached thereto, were the confessional that place of sin, that hell of iniquity and corruption, which our opponents represent it to be? We think not. Nay, does not this very consideration make it probable that, even in those few cases which are reported, there may be a little spice of that exaggeration with which religious zealots and bigots have been too familiar? If crime walk barefaced through the land, and each priest is in himself a moral leper to the neighbourhood, how comes it that there is so little authenticated proof of this moral delinquency? Is there so little rivalry and jealousy amongst the sects—is there so little resentful feeling in the bosom of a female injured in "her honour's nicest part," as to render this impossible? Is there so much guile, cunning, and hypocrisy in each priest as to enable him to conduct his "*amours and liaisons*" unobservedly and unobstructedly? and is there so much latent viciousness and criminality, so much detestable moral passivity, so little regard for virgin honour, in the soul of woman, as to render this probable? We cannot believe the libel on humanity. Let not the evidence against an Achilli be referred to. We denounce the man.

Again. Against the alleged moral delinquency there is arrayed all the parental affections and family ties, as X. has very properly hinted. The parental feeling is, perhaps, the purest and strongest which causes the heart-nerve to vibrate; and the fraternal affection especially between brothers and sisters is almost angelic in its purity. Can we, dare we think, then, that all these feelings may be carelessly and ruthlessly infringed without a wild, rebellious outcry, which would be sufficient to sweep from amongst existing things any institution in connexion with which such wrongs were habitually committed? Can the generous love and the warm instincts of a mother's heart be so warped by priestly craft that she would train up her daughters to sacrifice

their honour to a vicious and immoral priest—one, perhaps, by whom she was herself betrayed? Can a father's sense of right be so thoroughly outraged, and yet there be no hand upraised to smite the spoiler? Could he tamely submit to see the opening woman's charms nipped in the bud by a cool, calculating monster? Can the valorous heart of youth consent to see his sister become "one of the sorriest things that walk the earth," and not be tempted to pour red-hearted destruction on the head of the villain who did the deed? Who would believe all this? Sooner would we believe that the sun's rays could freeze the heart's blood of a hero into

eternal ice than that any form of religion could so systematically succeed in erasing from the soul its normal instincts. And if this be not so, then the confessional is not that destructive thing to morality which our opponents would insinuate, and we are bound to believe that the cases quoted in "Anti-Romish Controversies" are slanders.

Reader, peruse the arguments again on both sides of the debate; do not cherish bigotry nor cling to old prejudices, and we think you will come to our conclusion—that the confessional is in harmony with intellectual and moral freedom and social well-being.

CONFESSARIUS.

The Societies' Section.

ESSAY ON HISTORY.

(Continued from Vol. II. p. 471.)

THE life of humanity is neither easily written, nor easily studied. So numerous are the influences which act upon man—so diverse are the phases in which he appears—so different are the stages through which he has successively passed—so varied are the actors in the great world-theatre—so multitudinous are the events to be detailed—so intimately interblended are causes and effects—so multiplex and almost sumless are the agreements and antagonisms to be chronicled—so manifold the passions, interests, manners, customs, habits, states, actions, &c., which are to be brought together in harmonious combination before the "mind's eye," that it is difficult indeed to give unity, coherence, proportion, and artistic beauty to the whole. To amplify details without losing sight of the general congruousness and consonancy of the whole, is far from being easy. An equal difficulty, perhaps, attends the attempt to constrain the attention—to hold before the mind the multifarious and ever-differing influences, circumstances, personages, and actions which require to be regarded as mutually active and reactive. These difficulties, however, may be surmounted—largeness of view may be obtained—concentration of intellect may be acquired. Resolute mind-discipline must, of course, be resorted to, and a strict enforcement of self-control is necessary: these being unswervingly and unwaveringly put into operation, success is certain. Nor is the benefit to be derived from this stern and decided mental subordination trivial. "The school of example is the world; and the masters of this school are History and Experience. I am far from contending that the former is preferable to the latter. I think, upon the whole, otherwise; but this I say, that the former is absolutely necessary to prepare us for the latter, and to accompany us whilst under the discipline of the latter, that is, through the whole course of our lives."—"Experience can go a very little way back in discovering causes, and effects are not the objects of experience till they happen."—"Experience is doubly defective; we are born too late to see the

ning, and die too soon to see the end, of many things."—"History prepares us for science, and guides us in it."—By it "we are cast back, as it were, into former ages; live with the men who lived before us, and we inhabit countries that we never saw. Time is enlarged, and Time prolonged, in this manner; so that the man who applies himself early to the study of History may acquire in a few years, and before he sets his foot on the world, not only a more extended knowledge of mankind, but the experience of more centuries than any of the patriarchs saw."* "Nature gave us Curiosity, to excite the industry of our minds;" and the study of History affords us full scope for all our mental activities. "The truth that progress is the very end of our being must not be received as a tradition, but comprehended and felt as a reality."† As a great element in self-culture History is invaluable, not only for the knowledge which it gives, but also for the discipline which it enforces. Expansiveness of mind, keenness of thinking, clearness and consecutiveness of reasoning, closely-applied attention, perspicuity of judgment, and mental vigour of mind, are some of the chief advantages which are necessarily produced by the exertions of mind for which it calls.

We are, of course, aware, that in speaking thus we allude more to a manner of writing and studying which *ought to be* rather than *is*, although a few modern authors have adhered upon the main features which we desiderate in historical composition; of this, however, we shall have occasion to speak again; meanwhile, it must be remembered that we do not now of those indiscriminating chroniclers—those registrars of rumours—those categorizers of mere events—those weavers together of fiction and reality, superstition and truth—those prosing dullards, who have so often been honoured with the name of historians unjustly. All respect due to them as the accumulators of much hidden wealth, the value of which they knew not, we cheerfully grant them; but their immense cabinets of rubbish, mingled with the gold-grains of truth, we cannot dignify with the name of history. Nor do we now refer to those collectors of mere inventories of the births, ages, thoughts, and deaths of

"Conquerors and kings,
Founders of sects and systems; to whom add,
Sophists, bards, statesmen, all unquiet things,
Which stir too strongly the soul's secret springs"—

the twaddlers, whose chief delight it is to blazon forth the so-called glories of those stupid curses of their kind who have occupied the vanguard in "the social savagery of the age," whose writings almost ignore the existence of the people as a source of power—an element in the constitution of a state—an element in humanitarian progression—an immense multitude of souls formed in the image of God, striving after the perfectionment of their natures, and with no ascertainable limits to their intellectual, moral, and religious development—as anything else, in fact, than "hewers of wood and drawers of water"—human hell-creatures thirsting for each other's gore, labour-machines for the production of the luxuries and necessities of life for their taskmasters—as serfs of an ignoble breed, whose only duty

The preceding extracts are, *disjecta membra*, culled from Bolingbroke's excellent essay, "Of the Study of History," a work which every intending student should read with care. See Manning's "Self-Culture."

it was to live and labour while they were required—graphic delineators of the gorgeous grandeur and super-exalted excellence of despotic dynasties and war-encounters; but of the critical school of historians which has lately arisen, of whom we shall only name at present, as examples, Montesquieu, Vico, Schlegel, Niebuhr, Grote, Schlosser, Guizot, and Macaulay—men who recognise the divineness of

“This strangely-given gift of human life,
Compassed by mystery, as the stars by night”—

who cannot believe that men were created merely to “float adown the fretful tide of circumstance,” aimless and wind-piloted—who regard the people as immortal beings, by whom the True is to be sought, the Good to be striven after, the Right to be practised, and the Beautiful to be realized—who combine in one view the great events which have taken place among the nations, and ask wherunto they have tended, “whether to freedom or to despotism, to one or another form of civilization”—who aim at the perception of human destiny, watch the course of man’s progress, collect from large inductions the causes by which this grand object is furthered—who, while perceiving and acknowledging the fact that

“Crushed from our sorrow, all that’s great in man
Has ever sprung,”

do not fling doubts up in the face of heaven of the benignness of its purposes, but rather carefully demonstrate that

“The statesman’s toil,
The patriot’s war—all progress that we make,
Laborious, slow, earned at tremendous cost,
Have solely for their end to guard, diffuse,
And purify the simple joys of home.”

“How sweetly on the ear such echoes sound!” Would that the time were come when the great lessons thus enunciated were capable of being learnt by all the children of men! O that it were in our power to aid in the formation of student-thoughts such as these, and to assist in the diffusion of that critical sagacity and skill which seem to us so much required in the student of humanity’s world-life! Somewhat we have already assayed, and something more we shall now attempt.

On the very threshold of historical studies, conducted as we have indicated in the preceding paragraphs, we require a knowledge of some large well-grounded principles to form “the light of all our seeing.” “History involves in its composition many different and distinct objects, and has many different ends in view. In the execution it receives from the pen of the historian many graces and embellishments; and from the interest which man always takes in the concerns of man, it becomes a species of writing the most instructive to the mind and the most pleasing to the imagination. Divested, however, of these adventitious considerations, and logically viewed, it is *the investigation of facts through the channel of testimony*.”* This being the case, the lone student of History must give the laws of probability an early and important place in his preparatory mental exercises.

The doctrine of probabilities, so far at least as it regards that belief which is requisite

* Tatham’s “Chart and Scale of Truth,” vol. i. p. 315.

in History, has been so excellently treated of by Locke and the authors of "The Port-Royal Logic," that we do not think it necessary to do more at present than lay before our readers a concise summary of the observations which they have made on this topic. Locke defines "probability" as "likeness to be true." It is intended "to supply the defect of our knowledge, and guide us where that fails." The two foundations of probability are—"1st. The conformity of anything with our own knowledge, observation, and experience. 2nd. The testimony of others, vouching their observation and experience. In the latter is to be considered—1, the number; 2, the integrity; 3, the skill, of the witnesses; 4, the design of the author, when it is a testimony out of a book cited; 5, the consistency of the parts and circumstances of a relation; 6, contradictory testimonies."—"The mind, if it would proceed rationally, ought to examine all the grounds of probability, and see how they make more or less, for or against, any proposition, before it assents to or dissents from it; and upon a due balancing of the whole, reject or receive it with a more or less firm assent, proportionably to the preponderancy of the greater grounds of probability on one side or the other."—"As the conformity of our knowledge, as the certainty of observations, as the frequency and constancy of experience, and the number and credibility of testimonies do more or less agree or disagree with it, so is any proposition, *in itself*, more or less probable."*

Of the chapter of the Port-Royal Logic containing "some rules for the right direction of reasoning in the belief of things which depend on human testimony," the following is a brief abstract, viz.:—Things are of two kinds, the *changeless* and the *changeable*. Of the former, all truths are necessary, and hence universal; if any predication therefore is false, in any one instance, it is false in all; of the latter, most truths are contingent, hence universals may either be true or false according to circumstances and the nature of the thing. It is therefore necessary to attend to all the circumstances—internal and external—connected with an event: internal circumstances are those which belong to the consistency of the parts, or the probability of the nature of an event *in itself*; external circumstances are those which relate to the testimony on which we believe it. If the circumstances are such as are rarely the concomitants of falsehood, we have good grounds for belief; if not, we must either remain in suspense or doubt. When, however, possibility and probability unite in support of one account of a matter, the *fact* of which is sufficiently attested, although the mode of the fact is divergently stated, we ought to believe the one so supported rather than any other.† We are perfectly aware that against the whole doctrine of probabilities the lines of Agatho—

"Τάχ' ἂν τις εἰπὼς αὐτὸ τοῦτ' εἶναι λόγῳ
Ἐροτοῖσι πολλὰ τευχίειν οὐκ εἰκότι,"‡

may be quoted with some truthfulness. In order that we may present a correct idea of this matter, we beg further to extract the following quotation from Britain's greatest logician:—"We must remember that the probability of an event is not a quality of the

* Locke's "Essay," book iv. chap. xv.

† "La Logique, ou l'Art de Penser," liv. iv. cap. xiii.

‡ These lines have been elegantly translated thus—

"Even this, it may be said is *probable*,
That many things *improbable* should happen in human life."

event itself, but a mere name for the degree of ground which we or some one else have for expecting it. The probability of an event to one person is a different thing from the probability of the same event to another, or to the same person after he has acquired additional evidence. . . . Yet this makes no difference in the event itself, nor in any of the causes on which it depends. Every event is, *in itself*, certain, not probable: if we knew all, we should either know positively that it will [or did] happen, or positively that it will [or did] not. . . . Bearing this in mind, I think it must be admitted, that even when we have no knowledge whatever to guide our expectations, except the knowledge that what happens must be one of a certain number of possibilities, we may still reasonably judge that one supposition is more probable to us than another supposition, and if we have any interest at stake, we shall best provide for it by acting conformably to that judgment.”*

We have now placed in the hands of our readers some information regarding the preliminary *criteria* of historical truth; in a future portion of this paper we shall notice some of the circumstances in our world-life which, although too generally regarded with indifference, in the composition as well as in the study of history, yet exercise a mighty influence on the life, happiness, and destiny of the human race. S. N.

* J. S. Mill's "Logic," book iii. chap. xviii. p. 60.

REPORTS OF MUTUAL IMPROVEMENT SOCIETIES.

Westminster Athenæum.—The third annual meeting of this institution was held on Monday evening, October 11.

Tea having been provided for the members and friends, the business of the evening was opened by Mr. J. P. Sealiff, who was unanimously voted to the chair. The chairman commenced his observations by remarking, that he believed the objects of the society were generally well known; and although it had been denominated the Westminster Athenæum, it was founded on the principle of mutual improvement, and this was promoted mainly through the medium of lectures and discussions, and the use of a library. That the society was progressing in the sphere of its operations, and becoming of greater importance, might be gathered from the fact, that its last anniversary took place in a building, the limits of which could not possibly have afforded accommodation to the present audience. Having made other appropriate remarks, the chairman concluded by calling upon the secretary for a report of the society's proceedings during the past year.

Mr. E. Round, on rising, confessed that he looked with feelings of pleasure and satisfaction on the assemblage before him. To a mind that loved to revel in the joys which wisdom afforded, and to cull the wayside flowers of intelligence which the incidents of every-day life profusely strews in our path, a meeting like the present, composed of the earnest, the thoughtful, and the young, furnished the means of the noblest and sweetest enjoyment. What more interesting than to be surrounded by those with whom we were journeying in our passage up the mountain of literary acquisition, who, when some apparently insurmountable obstacle threatened to intercept

our course, would help us to surmount it, and who, as new beauties rose within the pale of their mental vision, revealed them to our notice, making us participants in the treasures their vigilance had won. This was but an imperfect description of the advantages arising from the system of mutual improvement; let the diversified fancies of those he was addressing impart to it an additional amount of colouring, and it would be found to possess additional charms. As the result of his own short experience he would say, that, vigorously pursued, it was a system conducive to real and efficient progress.

The report was then read, at the close of which Mr. E. Round continued as follows:—

“Having recently been favoured with a communication from the Editors of the *British Controversialist*, in which they express a desire that their journal should meet with greater publicity among the advocates of literary effort, I feel, as far as my limited influence extends, that I cannot better promote the object of their correspondence than by introducing the subject to all connected with this institution on the present occasion. The papers I am about to read will convey to such as are unacquainted with the work some idea of its contents and character.”

The table of contents of the half-yearly volume, together with “a statement of the history and present condition of the *British Controversialist*, with projects for its improvement,” having been read, the speaker brought his remarks to a close by adding, that he was satisfied of the value of the work, and had recommended it to many of his personal friends. To those in quest of truth, eager to escape the shoals and quicksands of error, he would say, support the *British Controversialist*.

sialist. Certainly, no member of the Westminster Athenæum ought to remain without it.

Mr. G. D. Welsh then rose to move, "That the *British Controversialist* be regularly provided for the use of the members," and went on to speak in high terms of the able and impartial manner in which it was conducted. It was a work of great worth, if considered only on account of the arguments it contained on various momentous subjects; but he especially esteemed it for the unsectarian and unprejudiced position its editors assumed. He would urge every one present to encourage it.

Mr. J. E. Williams seconded the motion, and briefly bore testimony to the value of the magazine, adding, that he had derived from it much benefit and assistance.

Mr. R. J. Brand, after glancing at the course of lectures to be delivered during the present quarter, in an interesting manner observed, with reference to the *Controversialist*, that he should not only peruse it frequently himself, but should introduce it to the domestic circle.

The Chairman (who was the first to introduce the work to the members of the Athenæum) put the resolution, which was carried unanimously.

Mr. H. Hayward, in an eloquent address, dwelt on the pleasures and advantages to be derived from mental pursuits, remarking, that if "knowledge" was "power," ignorance was power also, and that it needed the salutary influence of societies like the one he was addressing to counteract the evil and immoral tendencies which illiterate minds diffused. The influence for good that had gone forth from this society was incalculable, and he questioned whether any of the members were arithmeticians enough to compute it. There were no bounds to the pleasures learning bestowed. True, there existed a class of persons whose rusted and time-worn prejudices would not permit them to countenance such institutions, who were alarmed at the spirit and enterprise manifested by the young of the present age, and who fancied that the achievements of science and the revelations of philosophy would shake the bulwarks of truth. Religion had nothing to dread in the march of science and the investigations of philosophy; on the contrary, it had everything to hope for.

This, with an eulogium on the sympathetic and friendly feeling ever animating the members of the Athenæum, by Mr. H. W. Monro; a compliment paid to the exertions of the late secretary by Mr. J. K. Worrall; a few sentences from Mr. A. J. Round; recitations by Messrs. James and Fowler; and votes of thanks to the retiring officers and the chairman, terminated the evening's engagements.—A. J. R.

Manchester.—George Street Young Men's Mutual Improvement Society.—The first annual party in connexion with this society was held on Friday evening, the 17th of September, in the Wesleyan schoolroom, George-street, Hulme, Manchester. About one hundred persons sat down to tea. Subsequently, on the motion of the Rev. J. D. Brocklehurst, the president (Mr. E. Harrison) took the chair, who, after a short introductory speech, called upon the late secretary (Mr. J. W. Williamson) to read the report. This stated, that there were twenty-two members in connexion with the society; that during the last session many papers on various subjects had been

read, and the following, among other questions, had been discussed:—"Would the Adoption of Vegetarianism benefit the Human Race?" "Ought Capital Punishment be Abolished?" "Was the Execution of Charles the First Justifiable?" &c. The society, upon the whole, was in a prosperous condition. The chairman then called upon Mr. E. Sowerbutt to address the meeting, who, after making a few remarks on the report, &c., moved that the "report now read be adopted," which was seconded by Mr. Lewis, and supported by Mr. R. F. Allen, and carried unanimously; after which the following resolutions were adopted:—Moved by Mr. J. T. Slugg, and seconded by Mr. T. Pearson, "That at the present time an increased amount of education is particularly needful among the youthful population of Great Britain." Moved by Mr. H. Summersett, and seconded by Mr. W. Jones, "That such societies as the one of which we are now celebrating the anniversary will be among the various agencies to effect so desirable an object, therefore this meeting pledges itself to support them." Moved by the Rev. J. D. Brocklehurst, and seconded by Mr. Dalley, "That whilst the members of this society will use their greatest exertions to attain more knowledge, they humbly acknowledge the necessity of the blessing of God to make their institution effectual for the ends for which it was established."—J. H.

Manchester.—Rusholme Road Young Men's Improvement Society.—This society celebrated its ninth anniversary on Wednesday, the 6th of October, in the schoolroom connected with Rusholme-road Chapel. About 200 members and friends partook of tea, coffee, &c. These preliminaries having been disposed of, the president, Mr. Darling, took the chair, and commenced the more important proceedings of the evening by calling on the secretary to read the report, from which it appeared that there were thirty-five members and sixty-eight honorary members connected with the society; that during the year fifty-two meetings had been held, which had been well attended, and at which questions of a more interesting nature than usual had been discussed; that the library, which comprised about 200 well-selected and valuable works and most of the leading reviews of the day, was in a most efficient state. The following resolutions were submitted to the meeting by members and students of the Lancashire Independent College:—First resolution, moved by Mr. McFall, seconded by Mr. Wilde, and supported by Mr. Pion—"That the present position of this society, as detailed in the report, calls for increased and energetic exertions from all the members to sustain the character and to extend the usefulness of an institution so eminently conducive to their moral and intellectual improvement." Second resolution, moved by Mr. Bumby, seconded by Mr. Hague, and supported by Mr. Reed—"That this society is entitled to claim the attention and support of young men generally, because, by the peculiar advantages which it possesses, it is eminently adapted to qualify them for acting an intelligent part in the great social and political changes evidently so near at hand." Third resolution, moved by Mr. Shillito and seconded by Mr. Birch—"That sanctified intelligence being the most potent auxiliary for good, it is important that this society should ever recognise, and constantly seek, that divine

agency, without which 'nothing is strong, nothing is holy.' The meeting was also addressed by the Rev. James Griffin, who expressed the deep interest he continued to feel in the society. It was said by some that the effect of such societies was to engender sceptical notions and sentiments, but he could safely say such was not the case with respect to this society. On the contrary, it had been a most efficient means in the spread of truth. He exhorted the members to steadily pursue their useful course; for so long as the kind and fraternal spirit, which had hitherto been manifest amongst them, should continue to exist, their society would be the means of accomplishing still greater good. In the course of the evening desert, consisting of the various fruits, &c., in season, was placed on the tables, and freely partaken of by the company. The proceedings, which had progressed most satisfactorily, and which appeared to afford enjoyment to all present, terminated shortly after ten o'clock.

Manchester.—*Lever Street Young Men's Mutual Improvement Society.*—On Friday evening, October 8, 1852, the members of this society, with their friends, partook of tea, in the bandroom adjoining the schoolroom. The Rev. Wm. Jackson, president of the Wesleyan Society, took the chair. In concluding an able and eloquent speech, he said, that some persons were of opinion that more harm than good resulted from associations of this sort, in originating in the minds of some young men a wrangling disposition and a captious spirit; but he believed that the benefits arising from such societies very greatly preponderated over any evil that might be connected with them. He exhorted young men in particular to read that class of books that required the most thought—books upon mental and moral philosophy. After the chairman's address, the members were expected, as their names occurred on the list, either to make speeches, give recitations, or read some interesting extracts. Several of the members spoke on the nature, necessity, and means of self-improvement. The meeting was concluded with an earnest address to the young men present, by Rev. G. Robinson, the superintendent of the Lever-street circuit of the Wesleyan Association.

Hirwaun Mutual Improvement Society, formed in connexion with the *British Controversialist*. The first meeting of this society was held on Tuesday evening, October 12th, and proved very successful. It was numerously attended by the young men of the place; the chair was occupied by Mr. J. Sims, who delivered a short address, showing the beneficial effects of such societies. The object of the meeting was to elect the officers and adopt the code of rules, &c. The following gentlemen were elected officers for the first quarter:—Mr. J. Sims, chairman; Mr. W. Williams, treasurer; Mr. Leyson Rhys, secretary; Messrs. Evan Evans, Evan Rees, and D. P. Davies, committee-men. The newly-appointed secretary introduced the *British Controversialist* to the notice of the members, and recommended it "to all young men in pursuit of useful knowledge." He also mentioned the editors' kindness in sending circulars, &c. It was agreed that the society should order all the volumes already published of the *British Controversialist*, and that the members should take it in monthly.

Chipping Sodbury Mutual Improvement So-

ciety.—A soiree of the members and friends of this society was held on Tuesday evening, October 12th. After a social tea, the committee were enabled to present a very favourable report of the progress of the institution since its establishment in July, 1851, and an encouraging statement of its present position and prospects. The detail of the original essays and lectures of different members, and the discussions on various subjects carried on during the past year, was such as to prove that the society had not failed in the accomplishment of its professed object, and furnished grounds of cheering anticipation for the future. The engagements of the meeting were pleasantly varied by the introduction of an excellent desert; some interesting and encouraging addresses were given, and the party separated after an evening's enjoyment which will long be remembered with gratification. It appears by the report that the society numbers about twice as many members as at the corresponding period of last year, while its balance of cash in hand is also nearly doubled, notwithstanding the expenses consequent upon the establishment of a library and reading-room in connexion with it since that time. On the whole, the society has reason to congratulate itself on its past success and present condition, and may look forward hopefully to the occupation of an increased and extended sphere of usefulness.

Birmingham.—The annual meeting of the *Birmingham Debating Society* was held at the Philosophical Institution on Friday evening, October 1st. The chair was taken by J. T. Chance, Esq., president, who delivered an address, in which he dwelt upon the apparent hopelessness of permanently establishing such a society, when so many had failed. The rules of the society, however, afforded hope that it would be more permanent than its predecessors, since it excluded no class, and permitted free discussion to persons of every opinion. The election of officers was afterwards proceeded with, when Mr. G. Jabet was elected president, and Mr. W. J. Allen, secretary.

On Wednesday evening, October 6th, the seventh annual meeting of the *Edgbaston Debating Society* was held at the Hen and Chickens Hotel, Birmingham. After an excellent repast, the president, Mr. Thomas Martineau, commenced the business of the evening by a brief but appropriate address. Mr. W. Hudson read the secretary's report, from which it appeared that the number of members was thirty-two; that the average attendance was fifteen; that fourteen meetings had been held; and that the privilege of introducing strangers to the debates had been found to work well. Mr. Izod read the treasurer's report, showing a small balance in favour of the society. After the election of officers, and votes of thanks to those who retired, thirteen new members were proposed, and several interesting discussions announced.

Falkirk Literary Society.—A number of gentlemen residing in Falkirk and its vicinity held a meeting in the Red Lion Hotel there, on the evening of Tuesday, 5th October, for the purpose of establishing a society, having for its object the dissemination of knowledge and the cultivation of a taste for literary pursuits among its members, by means of essay reading and debates. A society was accordingly constituted under the above name, which, it is hoped, will supply a desideratum long

felt in the district, and be instrumental in carrying out the designs of its promoters.

Glasgow.—Manuscript Journal.—This journal was originated about six months ago by a few young men, anxious for their mutual improvement in composition, &c. All articles are sent to a committee, appointed for the purpose of examining and correcting them, and if approved they are inserted, and if not, they are returned to the authors, with such remarks as may be useful for their future efforts. It is based on thoroughly literary principles, as will be seen from the following articles, which appeared in the October number:—Review of the Past Month; the Duke of Wellington; History of English Literature, Art. IV.; Sonnet; the Sweetest Flower, a poem; Review of "Uncle Tom's Cabin;" Essay—Poetry, No. 2; Cholera. The benefit which the contributors have already experienced they unanimously confess to exceed their anticipations; and desirous that more should enjoy the benefit, they take the liberty of directing the attention of those readers of the *British Controversialist* who may be resident in Glasgow to it. A small annual subscription to defray expenses is the only condition of membership. All articles and correspondence to be addressed to Mr. David Mitchell, 61, Grove-street.

British Guyana Mutual Improvement Association.—The third anniversary of this association was celebrated by a soirée on the evening of the 3rd of September, 1862, at the spacious residence of J. C. Devonish, Esq., Hadfield-street, Werk en Rust, city of Georgetown, on which occasion a large number of ladies honoured the members with their presence. At eight o'clock the proceedings were opened with the "Grand State March," performed by the Misses Devonish on the pianoforte; after which Mr. J. C. Devonish, Jun., president of the association, was called to the chair, who made a few appropriate remarks in reference to the progress of the association during the preceding year. The honorary secretary, Mr. Isaac Smit, then read the report of the committee, which stated that the following ten useful and important subjects were discussed at the association's hall, viz.:—

1st. Who had the greater right to the British throne, Prince Arthur or King John?

2nd. Was Wat Tyler's rebellion justifiable?

3rd. Were the Americans justified in becoming independent?

4th. Is an hereditary monarchy preferable to an elective one?

5th. Had the Saxons, in the time of Alfred, a superior right to the Danes to possess the throne of England?

6th. Which was the greater general, Hannibal or Napoleon Bonaparte?

7th. Which best merited the title "great," Henry IV. or Louis XIV.?

8th. Which did more good to his country, Charlemagne or Alfred the Great?

9th. Whose claim to the throne was just, that of Edward IV. or Henry VI.?

10th. Was the deposition of Louis XVI. justifiable?

Three essays were also written by members: the first, by Mr. Ernest Tennent, on "Time;" the second, by Mr. George White, on "Friendship;" and the third, by Mr. Archibald Devonish, on "Printing." A lecture on "Anatomy" was delivered to the members by Allan Houston, Esq., M.D. The number of members belonging to the association at present is twenty-eight, almost all being natives of the colony, and of African descent.

The business of the past year having been brought to a close, the president vacated the chair, and the Rev. E. A. Wallbridge, patron of the association, was called to the same, who presided the remainder of the evening with his accustomed ability. After a few remarks made by him congratulatory of the association's attaining its third anniversary, the following gentlemen were unanimously elected office-bearers for the ensuing year:—Mr. J. C. Devonish, Jun., president; Mr. S. W. Dummett, vice-president; Mr. Isaac Smit, honorary secretary; Mr. James Hoby, assistant-secretary; Mr. John Cook, treasurer; Mr. Alexander Cumming, librarian; and Messrs. A. Devonish and George White, members of committee.

At the conclusion of the election the following songs were sung with great effect:—"The Sea!" by the president, and "Come o'er the moonlit sea," by the president and Miss M. Devonish.

The patron then called on Mr. John Cook to speak to the first sentiment, "The Past." This was followed by an instrumental piece of music, "Rousseau's Dream," performed by Misses Taylor and Van Sirtema. Mr. Isaac Smit spoke to the second sentiment, "The Present." This was also followed by another piece, "O dolce concerto," with variations, performed by the Misses Devonish. Mr. Samuel W. Dummett spoke to the third sentiment, "The Future." This was also followed by another piece, "Sound the loud timbrel," performed by Misses Taylor and Devonish.

Votes of thanks having been tendered to the ladies for their presence, and to the Rev. E. A. Wallbridge for presiding on the occasion, the meeting wound up with the national anthem, sung in parts by five members and four strangers. All parties separated in good humour, highly gratified with the evening's entertainment.

J. C. D., Jun., President.

The Inquirer.

QUESTIONS REQUIRING ANSWERS.

131. I should feel much obliged to any of your readers who could give me any information concerning Photography, construction of apparatus,

preparation of plates, &c. Also of that branch of the above, in which prepared paper is used instead of metallic plates, called, I think, calotype.—J. M.

132. Can any of your correspondents inform me why the eldest son of the Duke of Buccleugh

is not entitled marquis? All the eldest sons of Scotch dukes, with this, I think, single exception, are by courtesy called marquis; but in the case referred to the title is Earl of Dalkeith.—PIERRE.

133. Will S. N., C. W., Jun., or any other of the talented readers of, and contributors to, this excellent periodical, be kind enough to furnish "A Student" with rules or directions, showing him how to cultivate a habit of attention? He is one whose mind is apt to wander from the subject he is studying; and the attention, by being so diverted, causes the eye to wander over the pages, without the facts being fully understood or impressed upon the memory. Are there any studies specially adapted to remove this weakness; and, if so, what are they? As this is a subject of incalculable importance to all seeking to further their own education, as well as to the inquirer himself, any rules given will doubtless be thankfully received by many of the subscribers to this work.—A STUDENT.

ANSWERS TO QUESTIONS.

111. *Hereditary Insanity and Matrimony.*—

Insanity, or mania, is a disease on which much is still to be learnt. We have had an opportunity for a considerable amount of observation; but there have been cases (although rare) which have not been traceable to any apparent cause. In fact, sometimes we have found no morbid condition of the brain whatever, although generally, on post-mortem examinations, we have that morbid state of the brain which the French term *ramollissement*, or softening. The causes which produce insanity are various: it may be originated by causes diametrically opposite. 1st. From an excessive amount of action imposed on the brain by the exertion of the mental faculties, i.e., an over-exertion from mental power, as in the case of Southey, &c. 2ndly. From inactivity, producing partial idiocy. How often do we find a low state of intellect (terrible to behold) where there is no apparent thought or mental action, excepting for the gratification of the passions, reaping a passing pleasure; the mental power by such inactivity becomes weakened and degenerates. But the most common cause is, 3rdly, what I may term breach or over-extension of moral law; or a better definition would be, a departing from or going beyond healthy bounds and correct limits; as, for instance, *perversion of judgment, eccentricity, monomania*. We find a man of decided talent and respectability possessing a wrong judgment on one particular subject, for which we cannot account—another having a certain notion or dogma on religion or politics, &c. These are but stepping-stones to the more severe form of deranged intellect—mania. All these morbid or abnormal conditions have been caused by the intellect having taken a false view, or wrong channel. I think medical men will soon be able to gather much valuable information on this disease by studying moral law more closely. That there are hereditary constitutions and diseases is a fact beyond dispute; for example, the scrofulous diathesis is decidedly hereditary, the patient, consequently, being predisposed to phthisis or consumption. Insanity is considered to be hereditary; but the cases on record where it has descended from parent to child are very few, so that it can

only be considered hereditary to a slight degree. Can the offspring eradicate this predisposition inherited from the parent? This is a question on which there is much difference of opinion; but the majority of pathologists give their evidence in favour of the affirmative, in which opinion I most decidedly coincide. I am well aware that phthisis and the scrofulous diathesis, or king's evil, have remained dormant in the second and third generation, and appeared with increased virulence in the fourth; a fact which tends to nullify the opinion above stated. But in hereditary diseases there is one circumstance that ought never to be lost sight of, viz., the similar or contracted habits of the offspring. For instance, it is said that gout is hereditary. We find a nobleman who possesses a very large estate leads a very active life, spending much of his time in foxhunting, shooting, and other active exercises, living above par, and indulging in the luxuries of the table, drinking port, &c. If his active career is out short, or any circumstance should happen to prevent this activity, and cause him to lead an inactive and indolent life, as by old age, &c., he is, as a natural consequence, attacked with gout. When he dies the estate is left to the son, who is placed in the same circumstances and the same temptations as his father, with the same influences acting upon him. He will, most likely, lead a similar life, and contract the same habits, as his father; and consequently, when compelled to live in an inactive, indolent state, gout appears. Can the scrofulous taint be induced into a constitution entirely free from it? This is a question which does not admit of doubt. Mr. Benjamin Phillips, F.R.S., surgeon to Westminster Hospital, has written a valuable work on scrofula, in which he says, that if you were to give him the most healthy child born, he could induce a decided scrofulous diathesis. And now to answer the question of your correspondent. To the first question, as to whether he should be deterred from contracting matrimony? If this affliction has not attacked the parents for generations back, I answer, *No!* and I repeat it most *emphatically* and *unhesitatingly*. Neither will any moral culpability attach to him. To complete the answer, the only fear that exists is, the offspring of the *afflicted parent being born* more or less idiotic. I have, perhaps, enlarged too much; but I have done so because I know of no work that would exactly suit the inquirer. There is a small work published by Churchill, and written by Dr. Millingen, on the treatment and management of the insane. There is another work, entitled, "Insanity Tested by Science," showing the disease to be rarely connected with organic lesion of the brain, by C. M. Burnett, M.D., published by Highley and Son, 32, Fleet-street. There is a work by Dr. Conolly, but, as I have not read it, it would not become me to speak as to its merits or demerits.—ARTHUR SCATLIF, M.R.C.S. and L.S.A.

122. *Dissenting Colleges.*—"Earnest" is informed that the requirements for entering dissenting colleges are so various, that no general standard can be laid down. If he contemplates entering one he must be guided by his own circumstances and attainments in making a selection. The following extract from the "Regulations" of one of considerable standing may be of service to him:—"The plan of education has been arranged to meet the circumstances of two distinct classes

of students—those of advanced general education, and those whose requirements are more limited. It therefore comprises two separate courses of study: one properly theological, which occupies four sessions; and one comprising Hebrew and the Aramaean dialects, Greek and Roman classics, English literature, mathematics, and mental philosophy, in which students remain as long as may be necessary to prepare them, in the way of information or discipline, for the studies more immediately connected with the ministry. In conformity with this arrangement, applications are received from young men who, either at a university or elsewhere, have attained a proficiency in the branches of study just enumerated for admission to the theological course only; and from others, for admission to both courses. Every application for admission must be made by letter, addressed to the Chairman of the Board of Education, and must state briefly, but explicitly, the candidate's age, his belief, the length of time he has made a religious profession, his motives for desiring the ministerial work, his previous education, and the extent to which his education is advanced. It should be accompanied by a letter of recommendation from his pastor, a certificate of health from some medical practitioner, and such other testimonials as he may be able to procure." New College, London, in connexion with the Congregational body, is a most important institution. It has recently been formed by the amalgamation of several distinct colleges. Its principal is Dr. Harris, the author of "Mammon," "The Pre-Adamite Earth," &c., &c.; who is assisted by Professors W. Smith, LL.D.; Philip Smith, B.A.; J. H. Godwin; E. Lankester, M.D., LL.D., &c.; and Maurice Nenner. Other information may be had on application personally, or by letter, at the College, Finchley-road, St. John's Wood; and prospectuses may be had at Jackson and Walford's, St. Paul's Churchyard, London.—A. C.

124. *The Best Method of Studying Mathematics, with Advice to Students.*—It will not, I hope, be supposed that an endeavour to supply the information which "A Lover of Nature" needs, implies any presumption of being entitled to rank with the gifted few whom he appears to consider as alone competent to reply to his queries; or that the following statements, based as they are partly on my own limited experience as a student, partly on the testimony of others, are not liable to be controverted by a more extensive and careful induction of particulars.

In the study of mathematics, the analytical method, or method of resolution (which is probably that by which most propositions and theorems in the pure mathematics were first discovered), is considered by many scientific men to be the most useful as a mental discipline; although the synthetical, or method of composition, being in use in the schools, and better adapted for rapid progress, is preferable for a member of a university, especially if he be ambitious of a high place at the examinations. In the working of examples, however, and proving deductions even, he will frequently find it convenient, and even necessary, to resort to analysis. In both methods the pen should be constantly in hand; propositions synthetically proved, which have been committed to memory, should be written out, without book, once at least, and it is utterly impossible to follow

out any long analytical processes without writing. Numerous examples of both methods are given in Mr. Potts' admirable university edition of Euclid, which, together with Goodwin's "Course," and the "Collection of Problems and Examples," forms a complete and harmonious curriculum of elementary mathematical study. The latter work is the best of its kind, and, for the particular object with which it was written, there is no other. A few alterations might perhaps be advantageously made; but most of the propositions are concisely stated and clearly proved, and are free from unnecessary illustrations and deductions, which only serve to bewilder and discourage the student. The treatise on astronomy, however, is *too elementary*, has not illustration sufficient, and should be replaced by Sir J. Herschel's "Outlines"—a masterpiece of its kind, and which has completely thrown into the shade all previous popular works on the same subject.

The study of mathematics is not, generally speaking, to be regarded as detrimental to the health of persons whose constitutions are sound. Combe affirms it to be conducive to longevity, inasmuch as it calls into operation the reasoning faculties alone, and is opposed to that wild play of the imagination and exaltation of feeling which, in poets, priests, artists, and others, whose province lies amid works of imagination and fiction, occasionally terminates in madness. I am happy to give this testimony in favour of mathematics, as, from some remarks made in answer to S. E. E. (p. 397), it might appear that I thought the study *per se*, prejudicial to the health. They were suggested by the circumstance of a friend, who is extremely subject to headache, and otherwise of sickly constitution, having been ordered by an eminent physician never to open a mathematical book, nor read a proposition, at the risk of losing that inestimable blessing for which Juvenal tells us we should pray—the *mens sana in corpore sano*. He consequently left college altogether. Nevertheless this study, considered with reference to the nervous system, is undoubtedly, to persons of strong, clear intellect, less irritating than the generality of literary pursuits. Abercrombie, in his "Intellectual Powers," tries to prove that mathematicians are generally credulous and superstitious; but the evidence he offers is inconclusive. There is an able, though partizan, and therefore one-sided, view of mathematical study as a means of education, in Sir W. Hamilton's "Philosophical Transactions," recently published. It appears needless to say, after what precedes, that no person, be his constitution sound or weak, would think, if he were wise, of devoting two years, or one year, or even a single month, to the *exclusive* study of abstract science. The mind, under such treatment, would become cramped and lose its elasticity. It cannot be idle; nor can it be occupied for twelve hours in the day with mathematics; and if nothing else is offered to its attention, the inference is plain—it will fall to castle-building, a most pernicious habit. Six hours a day of close, absorbing study, is amply sufficient, even for those who aspire to the highest honours Cambridge has to confer, and for the majority, who are less ambitious, three or even two hours a day is enough, according to capacity. None should study above two hours at the same sitting. The attention, chained down too long to one subject, wearies, and should be refreshed, either by physical exer-

cise, or by turning for a time to works of a different character—history, travels, biography, mental and moral philosophy, and especially poetry. Works of natural history, and of human and comparative physiology, also offer a delightful resource to the student during the intervals of severer study. But in choosing a course of reading from among the numerous branches of literature which offer themselves, with their minor ramifications, it is necessary to exercise discretion. Happily for university students, this is done for them to some extent, inasmuch as all are required to pay some attention to the classical writers of ancient Greece and Rome, the fountain heads at which nearly all the great minds of modern times have drunk largely. But other elements, besides mathematics and classics, will necessarily enter, more or less, into every student's intellectual nutriment, in the selection of which, as of food for the body, he must be careful to have one staple preponderating element, to which all the others should be subsidiary, and to vary the preponderating element seldom, but the subsidiary as often as occasion requires. It is not, however, absolutely necessary that the minor elements should be invariably subsidiary to the staple, but departures from the rule should be few and of short continuance. Nothing weakens the powers of invention more than desultory miscellaneous reading, especially if performed in a careless, irreflective manner. Every one should have some definite object in view in reading, and, as much as possible, make every book read subservient to that object. There is some useful advice on this subject in Todd's "Student's Guide" (cap. iv.); and in a work by G. Combe, on "The Constitution of Man Considered in Relation to External Objects," general rules are given for the proper disposal of one's time (cap. iv.); both of which works I would earnestly commend to the attention of all who keep the physical, intellectual, and moral improvement, of themselves and of mankind, constantly in view. Upon those also who have one foot on the threshold of the temple of science, but who stand in doubt whether they have any right to enter, or whether any advantage is to be gained by doing so, I would strongly urge a careful and attentive study of Sir John Herschel's "Discourse on the Study of Natural Philosophy."—A TRINITY MAN.

126. *The Pharmaceutical Society's Examinations.*—In reply to the former part of W. B.'s question, respecting the kind of examination required to be passed for admission as a member of the Pharmaceutical Society of Great Britain, I think the following may be relied on, the writer having himself passed the ordeal. The candidate must send a notice to the secretary a month previous, of his intention to present himself. The Board of Examiners sit the second Tuesday in the month. The candidate must possess a very tolerable acquaintance with the Latin language, and be thoroughly familiar with physicians' prescriptions. Chemistry occupies an important place, especially that of the Pharmacopœia; he

must be conversant with the symbols and atomic weights of the elementary bodies, the doctrines of the science, as well as the method employed practically in the manufacture of all the chemicals that enter a chemist's shop. Under the branch of materia medica he will be expected to know at sight the botanical name and natural order of any drug presented to him, its medical properties, dose, and the mode of its procuring. In botany he must know the specific name and natural order of all the medical plants in a fresh state, write the determinate characters of a few of the more common natural orders, and be acquainted with the scientific names of the different parts of a plant. In addition to the above, he must be familiar with the use of tests, whether for adulterations or poisons, and be ready with the best antidotes and treatment for the latter. The expense, provided W. B. is up in these branches, will be one guinea. If not, the best books he can study will be Phillips's "Translation of Pharmacopœia," Fowne's "Manual of Chemistry," Pereira's "Materia Medica," Lindley's "School Botany." But far better than books alone would be attendance at the School of Pharmacy, Bloomsbury-square, where he will have the advantage of lectures on these subjects, a capital museum, admission into the Regent's Park Botanical Gardens, and the acquisition of practical chemistry in an excellent laboratory, under the direction of Professor Redwood, whose eminence as a pharmaceutical chemist is only equalled by the respect entertained by all who have had the privilege of his assiduous tuition. The expense for five months is £15 15s.; let W. B. enter for that term, he will then be in a position to know if further study will be requisite to pass.

In reply to the second question, there is not at present any body examining in chemistry solely. The London University, by a recent charter, has the privilege of instituting examinations, and giving degrees in different departments of science, but it has not yet been carried into effect. The degree generally obtained by chemists is that of Ph. D., from one of the German universities.—J. L. H. D.

128. *Mercator.*—In answer to your correspondent, "Irene," who wishes to know about Mercator, I may observe:—Gerard Mercator was a distinguished Flemish geographer and mathematician, born in 1512. After receiving an excellent classical education, and taking the degree of M.A. in the University of Louvain, he began at the age of twenty-four to learn the art of engraving, and his first production was a descriptive map of the Holy Land. In 1541 he made a terrestrial globe, which procured for him the patronage of the Emperor, Charles V., by whom he was employed to construct several maps, globes, and mathematical instruments. He published several maps of the world, Europe, France, Germany, the British Islands, &c., and died in 1591, at the age of seventy-nine.—J. B.

Thinking leads man to knowledge. He may see and hear, and read and learn, whatever he pleases and as much as he pleases: he will never know anything of it, except that which he has thought over, that which by thinking he has made the property of his mind.

The Young Student and Writer's Assistant.

GRAMMAR CLASS.

Exercises in Grammar. No. X.

1. Point out the difference between a personal pronoun and a relative.
2. Point out the difference between a relative pronoun and an adjective pronoun.
3. Give instances of words which are both personal pronouns and adjective pronouns at different times, and show why they are so.
4. Give the origin of the words *its*, *him*, *his*, *her*, *its*, *that*, *what*, *which*, and *such*.

MATHEMATICAL CLASS.

SOLUTIONS.—IX.

Arithmetic and Algebra.

Question 32. $\frac{4}{a} + \frac{4}{b} + \frac{4}{c} = 1$ (1)

$$\frac{5\frac{1}{2}}{b} + \frac{5\frac{1}{2}}{c} = 1 \quad (2)$$

$$\frac{6}{a} + \frac{6}{b} = 1 \quad (3)$$

$$3\text{rd} \times 2 \dots\dots\dots = \frac{12}{a} + \frac{12}{b} = 2$$

$$1\text{st} \times 3 \dots\dots\dots = \frac{12}{a} + \frac{12}{b} + \frac{12}{c} = 3$$

$$\text{by subtracting} \dots\dots\dots \frac{12}{c} = 1$$

$$\text{substitute } 12 \text{ for } c \left\{ \begin{array}{l} \frac{5\frac{1}{2}}{b} + \frac{5\frac{1}{2}}{12} = 1 \\ \times \text{ by } 12b \dots\dots\dots 66 + 5\frac{1}{2}b = 12b \\ \text{transposing, \&c.} \dots\dots\dots 6\frac{1}{2}b = 66 \\ b = 10\frac{2}{3} \end{array} \right.$$

$$\text{substituting } 10\frac{2}{3} \text{ for } b \text{ in third equation} \left\{ \begin{array}{l} \frac{6}{a} + \frac{6}{10\frac{2}{3}} = 1 \\ \times \text{ by } 10\frac{2}{3}a \dots\dots\dots 60\frac{2}{3} + 6a = 10\frac{2}{3}a \\ \text{transposing, \&c.} \dots\dots\dots 4\frac{2}{3}a = 60\frac{2}{3} \\ a = 14\frac{1}{2} \end{array} \right.$$

$$\begin{array}{l} \text{A, in } 14\frac{1}{2} \text{ days;} \\ \text{B, in } 10\frac{2}{3} \text{ days;} \\ \text{C, in } 12 \text{ days.} \end{array} \left\} \text{—Ans.}$$

D. D. S.

Question 33. Here $\frac{100 \times 3}{98} = £3\frac{1}{4}$ interest in the

Three per Cents. at 98; put x = required price;

then $\frac{100 \times 2\frac{1}{2}}{x} = \frac{250}{x}$ interest in the Two-and-a-Half per Cents. at x ;

$$\text{whence } 100 : 105 :: \frac{150}{49} : \frac{250}{x}$$

$$\text{or } 20 : 21 :: \frac{3}{49} : \frac{5}{x}$$

$$\therefore \frac{63}{49} = \frac{9}{7} = \frac{100}{x} \text{ and } 9x = 700 \text{ and } x = \frac{700}{9} =$$

$$77\frac{7}{9} \text{ the required price.}$$

W. D.

Question 34. $£100 : £30,000 :: £5 : £1,500$, amount of rent;
 $£100 : £80 :: £1,500 : £1,200$, the amount to be assessed;

6d. | $£\frac{1}{10} \mid \frac{1,200}{£30}$ the produce of rate. W. D.

Question 35. $7x + 8y = 127$ (1)

$$8x + 7y = 128 \quad (2)$$

subtracting (1) from (2) $x - y = 1 \therefore y = x - 1$ (3)

$$\text{substituting in (1) the value of } y, \text{ and reducing}$$

$$15x = 135$$

$$\therefore x = 9$$

$$\text{and } y = x - 1, \text{ or } 9 - 1 = 8.$$

P. T.

Geometry.

Question 16. The curve surface of a right cone is half the product of the perimeter of the base into the slant side; hence this product, added to the area of the base, gives the superficial content required.

$$\text{Slant side} = \sqrt{20^2 + 8^2} = 21.54;$$

$$\text{curve surface} = \frac{21.54 \times 16 \times 3.1416}{2} = 541.360512;$$

$$\text{area of base} = 16^2 \times 7854 = 201.0624;$$

superficial content,

$$= 541.360512 + 201.0624 = 742.422912 \text{ sq. in. —J. K.}$$

Question 17. Put x for diameter of smaller circle, or that described by the inside wheel, then diameter of circle described by outer wheel $= x + 11$. Now, the circumference of the outer circle is to circumference of inner circle as 3 to 2, and the diameters are in the same ratio,

$$\therefore x + 11 : x :: 3 : 2 \therefore 2x + 22 = 3x \therefore x = 22 \text{ ft.}$$

$$\therefore \text{Circumference of inner circle,}$$

$$= 22 \times 3.1416 = 69.1152 \text{ feet;}$$

$$\therefore \text{circumference of outer circle,} \quad \left. \begin{array}{l} = 33 \times 3.1416 = 103.6728 \text{ feet.} \end{array} \right\} \text{—Ans.}$$

$$\text{Question 18. Circumference of base of cylinder,}$$

$$= 2.5 \times 3.1416 = 7.854 \text{ feet}$$

$$\therefore \text{superficies of cylinder,}$$

$$= 7.854 \times 20 = 157.08 \text{ feet. —Ans.}$$

$$\text{Or, if we add the area of the two ends,}$$

$$= 4.90875 \times 2 = 9.8175;$$

$$\text{the total superficies,}$$

$$= 166.8975 \text{ feet. —Ans. C. D. S.}$$

Mechanics.

Question 15. We leave this question open another month.

Question 16. The pressure of water on a given part of the vessel containing it = the weight of a column of water whose base = in area the given part, and whose height = the mean height of water above that part.

$$\therefore 6 \times 10 \times \frac{1}{2} \times 62\frac{1}{2} = 18,750 \text{ lbs. = pressure on flood-gate.}$$

W. H. R.

QUESTIONS FOR SOLUTION.—XI.

Arithmetic and Algebra.

40. In what time will five shillings become five pounds, at five per cent. per annum, simple interest?

41. In what time will five shillings become five pounds, at five per cent. per annum, compound interest?

42. A house, garden, and field, are, together, worth a rental of £180 per annum; the house and garden, £150; and the garden and field, £90. What is the rental of each?

43. $3x^2 + 17y = 317$, and $3y^2 + 17x = 173$, to find x and y .

Geometry.

20. Required the weight of a hemispherical copper bowl, when filled with water, whose internal diameter is 18 inches, and the average thickness a quarter of an inch, the specific gravity of copper being 8.878?

Mechanics.

19. It has been found that the resistance to a train of eight carriages is 50 lb. when the train moves at the rate of 10 miles per hour. Required the horse-power necessary to convey a train of that size, and weighing 50 tons, at the rate of 50 miles per hour.

Notices of Books.

The Autobiography of William Jerdan, with his Literary, Political, and Social Reminiscences and Correspondence during the last Fifty Years. Vol. II. London: Hall, Virtue, and Co.

We regard this volume as unequal in interest with its predecessor. At the onset Mr. Jerdan devotes too much space to criticizing his critics. In his first volume he made, as we stated, some humbling remarks on literature as a profession, and made them in such a way as to imply regret that he had pursued it. This has drawn upon him the censure of some of his brethren, who, standing up for the dignity of "our order," have freely suggested that the error might lie in the complainant, and not in his profession. Now, it appears to us that here, as in many other disputes, there is some truth on both sides. That literature and literature receive the support which is their due few will maintain; while that William Jerdan was not a very prudent or provident man the readers of this volume must admit. In fact, he confesses some faults, and appears conscious of others, as he exclaims—

"O! would some power the giftie gie us,
To see oursel as ithers see us;
It would frae mony a blunder free us,
And foolish notion."

After Mr. Jerdan has rebuked his rebukers, he favours us with a further history of his connexion with the *Sun*, which terminates in a long account of anything but a creditable quarrel between himself and his partner, and which was wound up by serious litigation and loss. As we read the sickening details we could not but feel that the practice of a few elementary lessons on friendship and forgiveness would have prevented all this. In 1817 Jerdan, having left the *Sun*, became editor of the *Literary Gazette*, and connected with Messrs. Pinnock and Maunder, two of the world-wide names of literature. He presents his readers with some notices of his contributors, and many short extracts from their writings. It appears that Barry Cornwall made his debut in the *Literary Gazette* for 1818; and we find the following beautiful lines among his earlier pieces:—

"Gone from her cheek is the summer bloom,
And her breath hath lost its faint perfume,
And the gloss hath dropt from her golden hair,
And her forehead is pale, though no longer fair.

"And the spirit that sate on her soft blue eye
Is struck with cold mortality;
And the smile that played on her lip hath fled,
And every grace hath now left the dead.

"Like slaves they obeyed her in the height of
And left her all in the wintry hour; [power,
And the crowds which swore for her love to die,
Shrank from the tone of her last sad sigh.
And this is *Man's* fidelity!

"'Tis *Woman* alone, with a firmer heart,
Can see all these idols of life depart,
And love the more, and soothe, and bless,
Man in his utter wretchedness."

Under Jerdan the *Literary Gazette* appears to have increased in circulation; but this was probably as much owing to the efforts of the contributors as those of the editor himself. Strange as this opinion may seem, it naturally arises from noticing the names and reputation of many of the former, and the evident carelessness of the latter. If a man can allow himself to be indifferent to the literary execution of a work like the present, he would not be more attentive to one of a less permanent character.

Let not this judgment be deemed harsh, for in it we give our author credit for ability where it has not been displayed, and attributed that to carelessness which might have been put down to a want of discernment. The following extracts we hesitate not to append, in order to illustrate our meaning, and afford a suggestive lesson to our "neophyte" writers.

Speaking of the editor of the *Standard*, he says:—"His son, Dr. Giffard, is now one of the ablest political writers of the age; and, educated under such a father, it is not surprising that he should be as zealous as he is powerful; as is testified by the *Standard* newspaper, and everywhere else where his pen is wielded."

Referring to duelling he remarks:—"Party spirit rages, as it too generally does, in Dublin at this time, and was ATTENDED by CONSTANT duels, in superseding which there is undoubtedly some improvement."

Of Mr. Chalmers he bears this testimony:—"He had a thorough enjoyment of the good things of social life, to which his conversation contributed the appendages of pleasurable intelligence and instruction."

The exiled Princess of Condé, his "proximate neighbour" at Little Chelsea, is the inelegant subject of the following laughable description:—"The daughter of the murdered King of France dressed little better than a milkmaid, which rank, indeed, she much resembled in form, and walking about in thick-soled boots."

Space warns, or we might have given "a perfect shower of radiant suns" which have fallen from our author's "shivering quills," but we prefer bidding him adieu for the present, and, with a good-tempered smile, leaving him—to use his own figure—"like a peacock, the hero of his own tale" (tail?).

Rhetoric.

BY THE AUTHOR OF "THE ART OF REASONING."

No. XII.—ON STYLE.

SATIRE, to be pungent, must contain a considerable amount of truth; hence the causticity of the wit of him who said, Language has three purposes to subserve—1st. To conceal thought; 2nd. To conceal the want of thought; 3rd. To reveal thought. With what a keen eye must he have looked upon and seen through the falsities, the hypocrisies, the corruptions, the shams, of our ordinary social life! How accurately has he perceived the tedious malignity of scandal-mongers—the wordy eloquence of the dull and thoughtless! How cleverly has he peeped behind the veil of politic cozenage, sentimental nothingnesses, and hollow-hearted pretence! But no satirist, however "*acerbis fucetis incidere solitus*"—accustomed to scoff with bitter jestings—can be true to his vocation without being at once a humourist and a moralist, so that we must look beneath the surface of the words for the moral truth contained in this *jeu d'esprit*. It appears to us to imply that thinking is the true function of human life—that, as Intellectuality is our highest prerogative and most God-like attribute, its proper use ought also to be our holiest care. This entirely accords with our own opinion. Language should be the exponent not only of what is true, but also of what *ought to be* so. He who absorbs himself wholly in worldly gratifications—in those delights which belong to him as "the quintessence of dust"—is deaf to "the voice of God," with which the universe resounds—destitute of a due appreciation of the purest and most ecstatic joys which have been allotted to the tenants of this "nether globe," and guilty of soul-suicide. Man is essentially "a being breathing thoughtful breath." Truth is the aliment which his soul desires; and "Truth is thought which has assumed its appropriate garments, whether of words or actions." Truth-search and thought-utterance, these are the great duties of man. The world has endorsed this opinion by crowning with "blessings and eternal praise" the thinking members of the human race, whether their thinkings have resulted in the immortalization of marble, by imparting to it the visible presence of beauty—upbuilding the quarried rock into architectural sublimity—touching "the kindling canvas into life"—tracing the orbit-path of distance-hidden stars—performing the various chemical manipulations—the achievement of patriot deeds—adding to the comforts and conveniences of existence—making "the glittering arrows of the Almighty the medium between soul and soul hundreds of miles apart"—or revealing, in "the sweet music of words," all that transpires in the "fairy-land of thought." To think is an eternal necessity of the mind; to express the conceptions which pass within us is an irrepressible desire. That which ~~must~~ be done we ought to endeavour to do well. Hence arises at once the need and the use of our instructions in Style. We grant you that in giving these we have been dull

and prosaic; but not more so, we hope, than the necessities of the case warrant; for, as Father Malebranche remarks, "it is impossible in all discourses to move the senses and imaginations of others; nor ought it always to be done. * * * Writers of comedies and romances are obliged to please, and so procure attention; but for us it is sufficient if we can instruct even those that labour to make themselves attentive."* But to our task, with cheerfulness and care.

IV. STRENGTH.—Strength is the power of moving others at will. In enabling us to move, excite, and persuade men, words are peculiarly efficacious. Perspicuity, Conciseness, and Unity, are all elements in Strength, which latter supposes language to be animated with an earnest and intensified purpose, and to be so selected and disposed that the end in view may be efficiently wrought out. Strength, then, is that quality of Style which presents our ideas with the greatest possible force to the minds of those whom we wish to move. Upon the selection and arrangement of words the Strength of a sentence depends. "If words have all their possible extent of power, three effects arise in the mind of the hearer. The *first* is the *sound*; the *second* is the *picture* or representation of the thing signified by the sound; the *third* is the *affection of soul* produced by one or by both of the foregoing."† When all these *three* effects are produced, language has done its utmost. How these may be produced is the problem before us. The senses are the primary sources from which knowledge is derived, and hence the opening mind can only be intellectualized by being led to see Truth through a sensuous medium. The *real* is much more easily apprehended than the *ideal*. In the choice of words, therefore, those which are most specific and most clearly expressive of circumstantialities ought to be preferred to those which are abstract and general. "The more general the terms are, the picture is the fainter; the more special they are, it is the brighter." It is only by a judicious selection of what may be called picturesque words—words which place ideas before the mind with a vivid embodiment, an appearance of circumstantial actuality—that a strong impression can be made. "To make words *paint*, as if with brush and canvas, is a very high effort of literary art." "Picturesque language," says Emerson, "is at once a commanding certificate that he who employs it is in alliance with Truth and God." Specificity of terms renders tortuous circumlocution unnecessary, vapid redundancy impossible, and ambiguity of phrase unachievable if attempted. Terseness, brevity, and clearness are needful, if we desire forcefully to impress, mightily to move, or earnestly to urge on the human mind. The flatulent, the flippant, the frothy, the bombastic, do not move—to anything but laughter and contempt. Direct, straightforward, and sustained, must be the force which is intended to persuade to thought or action. Vagueness, generality, feebleness, and obscurity, are all adverse to this. Every phrase and figure employed must be so chosen and so disposed as to impress the mind strongly, and set the ideas before it clearly and completely. Precision of terms and brevity of expression, in opposition to whatever is ambiguous or superfluous; effective disposition and impressive arrangement, in opposition to nerveless and languid carelessness, is what must form the main object of study to him who would express his ideas strongly, or impress his hearers or readers vividly. Some

* "Recherche de la Verité," liv. iii. cap. i.

† Burke, "On the Sublime and Beautiful," part v. sect. iv.

observations regarding "what to aim at and what to avoid" we subjoin, in order to give form and precision to these otherwise disjointed remarks:—

1st. Be concise. Eschew verbosity: concentration of force is always advisable. Strength is employed in the empire of mind for the same purposes as force in the realms of matter—1, to counteract opposing force or forces, and thereby to produce equilibrium; 2, to overcome inertia, and produce motion. The more directly, therefore, the force is brought to bear upon the right point, the better. Mere epithets, and the profuse relation of unnecessary circumstances, are condemned by this rule.

2nd. Place the more important words in such situations as shall ensure the greatest attention. It is a principle of the human mind that the most vivid part of any thought—that which most strongly affects the speaker, or occupies the greatest prominence in his mind—demands utterance first; hence great attention may be secured for an important word or clause by placing it at the beginning of a sentence; *e. g.*, "*Great* is the Lord, and of great power."—" *They sank*, as lead, in the mighty waters." But if it be desirable to detain the mind, to sustain the attention, and pique curiosity, it is advisable to place the important word or clause at the end of the sentence; *e. g.*, "All these things will I give thee, *if thou wilt fall down and worship me.*"—"I confess it sometimes makes me shudder to see a young rake clasp his arms round the waist of a pure and innocent girl."*

3rd. So arrange the various clauses of sentences that they may appear in the order of their relative importance; *i. e.*, let them rise in a climax. No weaker assertion should succeed a stronger one as corroborative of it, for the natural properties of speech in general require that the proof adduced should be stronger than the thing sought to be proven by it. It is bad policy to put out all one's strength at the onset; the force which increases in power as it is exerted is more valuable than that which becomes weaker by expenditure.

4th. Employ specific words, when suitable, in preference to general or abstract ones. If a whole class of sensible objects can be described by an individual member of it; if an intellectual subject can be illustrated by a reference to sensible objects, or an abstract idea made more readily intelligible by an analogy between it and any perceptible quality in objects; a more striking impression is made upon the mind than if we neglected these means of definitely representing our thoughts to the mind; *e. g.*:—

———— "O'er many a dark and dreary vale
They passed, and many a region dolorous;
O'er many a frozen, many a fiery Alp,
Rocks, caves, lakes, fens, bogs, dens, and shades of death—
A universe of death."

5th. When resemblance or contrast of ideas requires expression, a similar or contrary mode of construction should, in general, be employed; an equal number of correlative words, appropriately adjectivized, should be used in each of the antithetical clauses, and these ought, as nearly as possible, to be of equal length. This antithetical uniformity will be found beautifully exemplified in Johnson's comparison between Dryden and Pope, as well as in the following sentences, *viz.*:—

* Longfellow's "Hyperion."

"Virtue is like precious odours, most fragrant when they are incensed or crushed; for prosperity doth best discover vice, but adversity doth best discover virtue."—*Bacon's Essay, "Of Adversity."*

"The joys of parents are secret, and so are their griefs and fears; they cannot utter the one, nor will they utter the other. Children sweeten labour, but they make misfortunes more bitter; they increase the cares of life, but they mitigate the remembrance of death."—*Bacon's "Of Parents and Children."*

6th. Never, if able to avoid it, terminate a sentence with an undignified word or phrase; *e. g.*, "That is a matter I shall require to think of."

7th. Let your thoughts be closely knit together, and never introduce expletives or intervening clauses, unless when absolutely necessary to strengthen the desired impression. See that you be not of those to whom Swift says—

"Epithets you link,
In gaping lines, to fill a chink,
Like stepping-stones, to save a stride,
In streets where kennels are too wide;
Or, like a heel-piece, to support
A cripple with one foot too short."

V. VIVACITY.—Vivacity is the result of a combination of many excellences, such as novelty, uncommonness, contrast to common-place, geniality, heartiness, and sprightliness of language. These give a smack to composition which makes the reader relish and admire it. Novelty is always delightful to man's fickle and changeable humour; the strange, or that which lies beyond our own experience, excites and attracts attention; anything opposed to the routine or habitual use and wont of ordinary life awakes the thought-powers of man. The manifestation of warm, loving, sympathetic feelings, large-heartedness, genuine philanthropy, and racy good nature, as they excite similar feelings within us, please and gratify our nature. Anything that strongly affects the human susceptibilities, and stirs unitedly the affections and the intellect, adds to the vivacity of Style, because it originates an intensified power of apperception in the reader or hearer. Thoughts are thus introduced at once to different faculties of the intellect, and when their interest is simultaneously gained, the capacities of idea-reception are increased. An easy, animated, flowing, figurative, and refined colloquiality tends much to the production of a vivacious Style. Of course, we mean that the Style should be adapted to the thoughts to be expressed, and do not at all wish to be understood as advising an affected familiarity and jocularly of expression on unsuitable occasions; we merely recommend the acquisition of that humanity of spirit which, expanded by love to all, and glowing with tenderness towards all, imparts a healthy heartiness and genuine cheerfulness to every effort which we make to inform or reform others. We have already more than once asserted that Thought and Style are twin-children of the Intellect; and all we can pretend to do here is to recommend a few directions for rearing them healthily, and enabling them to get over the diseases incident to the immaturity of infancy and youth. Vivacity of Style, therefore, will chiefly result from the inner nature of a man. If he feels as well as thinks—is emotive as well as intellectual—his Style must be vivacious and striking. There will be a loving sort of enthusiasm interblended with his greatest thoughts, and common-place will not befog his compositions; but a gratifying earnestness, a sympathetic kindness, a kind of continual good-humouredness, will suffuse all that he does or says.

There are, therefore, few directions regarding verbal usages required under this division of our subject: the heart which seeks to affect me must previously have been affected itself. The grasp of a death-cold hand will not warm my blood, neither will a dry, feelingless prosaicality arouse my emotive nature. Look to your own hearts; feel there, then express yourselves.

1st. Avoid an overstrained dignifiedness as much as a low, vulgar chit-chatiness and babblement.

2nd. Think clearly, then choose the most expressive terms to embody your thoughts. The man who merely "blunders round a meaning" can never write with vivacity.

3rd. Avoid a drawling, expletive, loquacious verbosity of speech or writing.

4th. Choose those figures of speech or illustrations which will be most likely to interest those whom you address, and that phraseology which is most suitable to the topic under your consideration.

VI. HARMONY.—Harmony refers to those melodious cadences which give agreeability to Style. It depends upon the choice and arrangement of words. Some combinations of letters are more easily pronounceable than others, and such words are, in general, more gratifying to the ear than those of more difficult articulation. Euphonism is certainly a high attainment in composition, as it is necessary that there should be an accordance between the sound and the sense, a sort of correlative symphoniousness between the thought and the words employed to express it; yet we would never advise the sacrifice of expressiveness to harmony. Whenever harmony can be introduced as the auxiliary of the foregoing qualities of Style it is right to introduce it; but, unless clearness is to be added to our conceptions by the use of harmonious and cadenced words, we ought rather to avoid their use. To attempt to express anger, indignation, or invective in the namby-pamby versification of Waller, or soul-nerving enthusiasm in the cold classicality of the Addisonian prose, would simply be ridiculous, and could only be paralleled by the folly of an endeavour to utter the airy gracefulness of Moore in the sonorous periodicity of Johnson. There seems to be a natural felicitousness of expression in some authors, which suits so exactly with their general strain of thought, that no contrast between the ideas and the expression is ever felt—no incongruity of matter and manner is ever experienced. This is an excellence which the student should diligently labour to acquire. The intimate connexion which exists between ideas and language seems to make the necessity for attention to harmony obvious. Discourse, to be attractive, must be pleasing, not grating and repellant. Quintilian truly remarks, that "nothing can enter into the affections which stumbles at the threshold by offending the ear." *Rythmus*, or the adjustment of the measure of sounds to the ideas which we intend to express, has a very powerful influence in determining the reception which these ideas shall receive. Every sound, syllable, word, and phrase, ought to be attuned to the sense, and have a relation to the moral purpose of the writer. If we would do this effectually, we must avoid a stiff and stately diction, strained syntactical inversions, pedantic and erudite terms. We must make nothing singular for the mere love of singularity. True harmony does not result from the adoption of the most decidedly musical sounds which we can find, but in the choice and fitting arrangement of those successions of vocables which possess the greatest possible *relative* melody; that is, such as are most nearly indicative of the feelings which

ought to be originated by such thoughts. Not the most melodious sounds, but those most consonant to the topic of discourse, constitute what rhetoricians denominate Harmony; hence the harshest hurly-burly of vocables may be, in their own places, as accordant with the principles of Rhetorical Harmony as the choicest "concord of sweet sounds."

The following passages may be quoted as illustrations of the accuracy of the foregoing remarks, viz.:—

1.

"Blue-eyed girls

Brought pails and dipped them in the crystal pool,
And children, ruddy-cheeked and flaxen-haired,
Gathered the glistening cowslip from its edge."—*Bryant's "The Fountain."*

2.

"Above them,

High in the air, perched on the precipice,
My fair enchantress spied a little flower—
A solitary rose—which bloomed distinct
Against the sky, and on its tender stalk
Held to the glorious sun and the wide heavens
Its leafy, nectared chalice;—held it there,
With laughing boast and bold fragility,
High o'er the head, beyond the reach of all.
She drew her rein a moment to admire
The little dauntless covetable flower;
And my brave knight, whose eye still follows hers,
Caught at the half-formed fancy; setting spurs
To his astonished steed, made up the height;
He tore his desperate course, and plucked the toy.
The lady shrieked; but, ere the blood had time
To quit that lovely cheek it revels in,
He brought the panting courser to her side.
The rose was hers."—*Smith's Dramas—"Athelwold."*

3. "And at night so cloudless and so still! Not a voice of living thing—not a whisper of leaf or waving bough—not a breath of wind—not a sound upon the earth, nor in the air! And overhead bends the blue sky, dewy and soft, and radiant with innumerable stars, like the inverted bell of some blue flower, sprinkled with golden dust, and breathing fragrance."—*Longfellow's "Hyperion."*

4.

"Now swells the intermingling din. The jar,
Frequent and frightful, of the bursting bomb;
The falling beam, the shriek, the groan, the shout,
The ceaseless clangour, and the rush of men,
Inebriate with rage. Loud and more loud
The discord grows; till pale death shuts the scene,
And o'er the conqueror and the conquered draws
His cold and bloody shroud."—*Shelley's "Queen Mab."*

5. "He has the indisputablest ideas; but, then, his style! In very truth, it is the strangest of styles, though one of the richest; a style full of originality, picturesqueness, sunny vigour: but all cased and slated over, threefold, in metaphor and trope; distracted into tortuosities, diallocations: starting out into crotchets, cramp turns, quaintnesses, and hidden satire."—*Carlyle's "On Mirabeau."*

The chief rules for Harmony are those which follow, viz.:—

1st. In the choice of words avoid, unless where absolutely necessary for expression, the use of harsh, grating, and unmelodious words; e. g.—(a) Those which contain a concurrence of the same vowel, as, re-estimated, co-ordinal, &c. (b) Those which contain two or more

rough-sounding consonants; *e. g.*, chroniclers, grudged, perturbed, attacked, &c. (c) Those which have frequently recurrent letters or nearly similar syllables, as, pre-reactionary, sillily, externalily, farriery, &c. (d) Lengthy compounds, when more fluent and equally expressive synonymes can be found, as, shamefacedness, tenderheartedness, distressfulness, &c. (e) Such lengthy words as have their accented syllable placed so near the beginning as to cause a difficulty in pronouncing them, as, réceptacle, arbitrarily, extra-mundaneity, &c.

2nd. In the arrangement of words, those collocations should, in general, be preferred by which the greatest euphony is producible; hence the following ought to be carefully guarded against, *viz.*:—(a) Successive words beginning with aspirated *h*, as, his historical genius. (b) Words ending with one sound succeeded by words beginning with that sound, as, sterile illiteracy—accuracy, assiduity, and care, &c. (c) Words ending in vowel sounds succeeded by words whose initial syllable has a vowel sound, as, Though all do owe you honour; Go! no evil will accrue to you, &c. (d) Words having a consonant ending similar to the initial consonant sound of the succeeding word, as, Who dares tax Xerxes with injustice? Strike, Iconoclast! Bring gingham! &c. (e) Words whose first syllables have the same sound, or the final sound of which is similar to the first syllable of the following words, as, I can candidly canvas Canterbury; You likewise wisely chose, &c. (f) Words of similar terminational sounds, as, I confess with humility my sterility of fancy and debility of judgment. (g) A succession of monosyllables, as, Do not go on on this road far, father, &c.

3rd. In distributing the clauses of a sentence, we should so arrange them that the whole may be easily and readily pronounced, and thus convey an agreeable impression to the ear:—(a) Clauses should neither be too long, nor disproportionately assorted. (b) The various clauses should be arranged in the order of their length and importance, *i. e.*, form a climax—this, of course, supposes that the length of the clauses is to increase with the importance of the thought. (c) Monosyllables ought as seldom as possible to end a clause, and terminational monosyllables ought never to be emphatic.

4th. In composing a paragraph, long, short, and intermediate sentences ought to be judiciously intermingled. Short sentences are conversational, and long ones are oratorical. Composition, to be good, ought to combine as much conversational ease and idiomaticity as is consistent with the calm dignity and elevation which are expected of the writer.

5th. Be natural and unaffected. It is true that, “with many readers, brilliancy of style passes for affluence of thought; they mistake buttercups in the grass for immeasurable gold mines under ground;” but “the natural alone is permanent.” “In Style, as in all things else, simplicity is the supreme excellence.”* “Unnatural utterance hinders usefulness. From aiming at peculiarity, or from too artificial a training, language becomes disjointed in a great variety of ways. Some men, in pursuing thoughts, forget harmony; while others seem to set their ideas so completely to music, that their hearers or readers lose sight of the subject in listening to the sweetness of the melody. Occasionally we find a man who speaks or writes as if his soul stuttered, so as to form a hundred

* We quote the above extracts from memory; we believe they are from Longfellow's “Kavanagh,” chap. xiii.

periods in a page. The jet from the fountain comes in fits, so many times a minute. The conjunctions are all disjunctive. It is a strange piece of music. It has startling variations. It is staccatoed throughout. There is a rest at every bar. It is emphatic; but it is apt neither to be understood nor remembered. Others take no breath, and rush on like a cataract, impetuous, unproductive, dangerous, destructive, wasting their rough energy in noisy violence; and, bounding headlong to an unknown end, they confound the waters of life into foam, and lose themselves in whirlpools. Sober reason instinctively adopts the medium, and measures her eloquence by the nature of the subject and the state of feeling proper to the occasion. The cause of so much ineffective utterance is found in the fact, that the thoughts and the feelings do not flow together. They are sought apart, and kept apart in spirit and in power, although seemingly wedded together by sound—*vox et præterea nihil*—(it is a voice, and nothing else). A natural ear can always detect an unnatural eloquence, and none but the habituated lovers of listening can feel the truth inviting them except from lips ‘touched with a live coal from off the altar.’

“Truth and right feeling have an order of their own; but an affected mannerism is the disguise of a false and rigid animation. * * * The living fires burn with a lambent harmony and freedom, and, like the luminous waves that clothe the sun, need no cincture to bind them to their places. The laws of light are those of beauty, and clear thoughts require but little art for their proper exhibition.”* They become harmonious, clear, strong, concise, and vivacious in expression, in exact proportion as the mind of the speaker or writer really feels, and utters what he feels just as he feels it. A play of shadows in the realms of fancy, however lovely, will never move like the actualities of earnest thought vigorously expressed; for,

“As the sun transmutes the sullen hues
Of marsh-grown vapours into vermeil dyes,
And melts them later into twilight dews,
Shedding on flowers the baptism of the skies,”

so does the heaven-given energy of earnest thought adorn our ideas with beauty and enable us to utter them in music.

Another year will soon have joined “the past eternity,” and during that period we have been companioning together. Have we rightly considered our relative responsibilities while so connected? and have we been earnestly striving to fulfil the poet’s imagination:—

“Stay, stay the passing moment, and impress
The mark of wisdom on its shining wing?”

Have we remembered that

“Whatever man possesses God has lent,
And to his audit liable is ever,
To reckon how and where and when ‘twas spent?”

If so, it will be well; if not, *now* is the fit time for “changing the fashion of our spirits.”

In the hope of meeting again, we say, Farewell, reader, till Time’s new babe be born.

* Moore’s “Man and his Motives,” p. 182.

History.

WERE THE EFFECTS OF THE CRUSADES FAVOURABLE TO THE
CIVILIZATION AND MORAL ELEVATION OF THE PEOPLE?

AFFIRMATIVE ARTICLE.—IV.

THERE are considerations affecting, in a degree the most stupendous, the moral and social well-being of society, which are nevertheless, to ordinary minds, a complete blank. If, indeed, to such minds they become matters of cogitation, they are looked upon as mere sentimental moonshine—an unaccountable anomaly in human nature, fit thoughts of persons in love or elderly bluestockings. For example, what is more common than to hear people laughing at what they term “superstitious fears,” without considering that they are dealing with the most recondite questions in human nature. There is an awful gloom which encompasses, to all rightly-constituted and powerful minds, all mysteries of death and the grave; it lives within them, and forms no inconsiderable portion of the moral forces of their nature. And nothing, in our opinion, is more preposterous than the attempt to substitute dry, scientific knowledge for this education of the imagination and mind—to drive all these sacred terrors from the mind—and, instead, to furnish us with the history of the steam-engine, or experiments in chemistry or natural philosophy.

It may, indeed, be urged that the unreality of these things has been demonstrated. This we beg leave to doubt. There are many things which do not admit of scientific demonstration, yet which, nevertheless, exist as motive and active power in this world. Nay, it might, no doubt, be demonstrated, with apparent logical correctness, that the sun does not shine; but would this avail? The glory of its beams would still continue to fall on tree and tower—the lake would still glitter, mirror-like, in the summer evening sunset, and *coups de soleil* would not be the less frequent. And how little avails the sceptical objections of material science against these freezing horrors—accompaniments of Nox and Erebus—reminiscences of lonely walks by midnight on haunted moors, when

the moonbeams burst from betwixt broken clouds! All these live not in the human mind without a purpose. Emerson, I think, speaks of the death of children as stimulating and awakening the higher nature of the parent—as linking him more closely with the invisible and infinite. And this is also the office of those supernatural terrors of which I have spoken. They, notwithstanding their being ignored by a few individuals destitute of an inner nature—by sceptics, defective in their emotional nature—fulfil a most important function, not only in the education of individuals and communities, but of the whole human race. That function is, to awaken the inner consciousness of man; in other words, they teach him how to THINK. They are the means which enable man to arrive at the highest privilege of his nature—the power of self-knowledge.

It might also be shown that this is the nursery of the sciences; in short, of all that has sprung from the reflective nature of man; but this I shall content myself with affirming.

But the scepticism of which I complain is not confined merely to that to which I have just alluded; it is extended to well nigh all the moral phenomena of man's nature, from religion downwards. But among the great moral forces, of which the existence has been doubted in more than a common degree, is that class from which has sprung great convulsions in the history of mankind; *e. g.*, the French Revolution of 1792; or, greater still, the Crusades. It is true, there is some ground for this among philosophic observers of history, these outbursts of mental force having interfered in a very sad and reckless manner with speculations and conclusions of the most promising character. Indeed, for a genuine old Tory to believe other than that this said French Revolution was incited by the Radicals would be considered tantamount to apostacy from his political faith.

Of these great mental impulses—heroic moments, as Emerson would call them—in the history of our globe, perhaps the greatest is the Crusades. It was a period of deep feeling, when the human race seemed to awaken to a sense of responsibility—when death and danger were disregarded, so that man could but perform the mission that was before him. Not but on such occasions he ran into great follies; nay, doubtless, in such moments of abandonment these were predominant; the motive and the mental condition alone were nobler. This mighty movement, so greatly remarkable for the absence of selfishness in its leaders, was perhaps, at the time it occurred, the most advantageous possible for Europe. The nations were then young—newly organized; they required pressure from without to consolidate and establish their power upon a firm basis, and this they found in the Crusades. What other movement than this—which united the strongest faith in the cross with the greatest courage and self-exertion in the individual—could have filled the heart of Europe with poetry—could have developed that noble institution, chivalry? And, doubtless, it was the holy and religious impulses which led the way to this war, that softened the hearts of the rude warriors to the gentle influences of women. Here was a holiness—a devotedness—which,

however foolish they may appear to us in the nineteenth century, were, nevertheless, of the very highest importance to the age of the Crusades—to the rude, unlettered barons, and men at arms. Courage and faith, are they not the twin pioneers of civilization—courage, the strong, self-helping arm upon earth; faith, the sanctifier, the spirit that comes from heaven? The one without the other is grasping selfishness or helpless inanity. The objection which is constantly urged against the Crusades by observers in the nineteenth century—that they were without practical results—is wretchedly unphilosophical. No age properly admits of comparison with any but itself. It is enough that the motives appeared sufficient for our forefathers. It is the purest arrogance to believe that, had we lived then, we should have been wiser. The positive direct benefits of these precipitations of Europe upon Asia are to be found in the strong faith which was evoked, the consequent deepening of the human consciousness, and thus a general awakening of the moral nature. That these benefits have not been more clearly seen; indeed, that the present subject is matter of debate at all, arises from the imperfect knowledge which we have of moral forces, and the difficulty of arriving at a correct estimate of them. HAROLD.

NEGATIVE ARTICLE.—IV.

"The principle of the Crusades was a savage fanaticism, and the most important effects were analogous to the cause. The belief of the Catholics was corrupted by new legends, their practice by new superstitions; and the establishment of the inquisition, the mendicant order of monks and friars, the last abuse of indulgences, and the final progress of idolatry, *flowed from the baleful fountain of the holy war.*"—Gibbon, "*Decline and Fall*," chap. lxi.

WHILE the Crusades have been a theme of exultation or regret to many, according to their feelings or prejudices, they have ever been the subject of astonishment to all. That so many human beings should, by the tale and tears of a solitary and despicable monk, be aroused from the sluggish habits of their social life, and fired with a spirit of daring enthusiasm—that the whole priesthood should have unanimously espoused his cause—that monarchs and merchants, princes and peasants, chieftains and slaves, fiefs and their vassals, and even maids, and mothers

with their children, should have at once entered into a scheme for leaving their fatherland and their possessions, and marching to an unknown country, cannot fail to arrest the attention of the student of history. That this enthusiasm should for such a length of years have continued to animate the minds and influence the conduct of the whole of the European nations, is indeed a matter of astonishment. That men who had hitherto led lives of the most widely different description—the unlettered boor, who had lived quietly in his humble cot; the robber, whose abode was the fastnesses of the mountains; and the haughty aristocrat, who had enjoyed the luxury of property and the services of vassals—that all should have suddenly given up their peculiarities, and have joined together, actuated by the same motive, and impelled by a like frenzy, to set out on a perilous expedition to free the Holy City

from the Turk, is certainly a subject which may well engross the attention of mankind, and from which they may be willing to learn. That this could not all be effected without producing deep and powerful organic effects, even where society was rude and unformed, no one will presume to deny. That these effects were unfavourable to the civilization and moral elevation of the people, we shall now attempt to prove by the following considerations:—

First. The causes and the motives which led to the Crusades. We have been at some pains to inquire into the history of these wars, and we fearlessly say that we can discover in their origin and prosecution the evidence of no worthy or ennobling motive. They were the product of rude ignorance, of treacherous cunning, of martial rapacity, and of frenzied fanaticism. The end seems to have been held to justify the means. There was the first and grand appeal to the people to enter the lists against the enemies of the Saviour, to succour and avenge their injured pilgrim brothers, and to redeem the Holy City from the possession of the Mussulman. In this they were deceived by "cunningly-devised fables" respecting "lands flowing with milk and honey—of mines, and treasures of gold and diamonds—of palaces of marble and jasper." These were to be the rewards of the pilgrim; and the wealth of the infidels was regarded as the fair and legitimate object of plunder; and even the flavour of the wines and the beauty of the women were held forth as incentives to the march. Promises of pardon for the deadliest crimes, and the sure possession of eternal happiness, was to be the reward of a pilgrimage to the East, with the destruction of the infidel, and the recovery of the tomb of the Saviour. How sadly was everything holy in the faith and practice of true religion perverted, and what sickening horrors were perpetrated in the name of the Prince of Peace!

Secondly. The character and conduct of the Crusaders forbid them being regarded as aids to civilization or moral elevation. "At the voice of their pastor the robber, the incendiary, the homicide, arose by thousands to redeem their souls by repeating on the infidels the same deeds which they had exercised against their christian brethren," and the "terms of atonement were eagerly

embraced by offenders of every rank and denomination." None were refused admission to the saintly army. The prince was honoured, the peasant flattered, the young and stalwart, whatever their character or crimes, were welcomed to the ranks, and even women and children were allowed to swell their numbers. To prisoners a general amnesty was granted, and to debtors a freedom from the diligence of creditors. Before all earthly ties and considerations was the call of the church and the battles of the cross. It was enough that they were filled with hatred to the followers of the false prophet, and longed to wreak vengeance on all who resisted the Pope, and were willing to hasten to the redemption of the holy sepulchre.

Such were the elements of the army that marched to Palestine. Men ignorant, avaricious, and bloodthirsty; not themselves the subjects of civilization or enlightenment, and certainly very unlikely to teach these to others. Their conduct was such as might have been expected from such an army placed in such circumstances. Wherever their march was opposed, or their hopes of plunder excited, their revenge was fearful, and their rapacity boundless. Oppression and cruelty were their concomitants, and a butchered people and a devastated country were in the track of their progress. Nor were they able to restrain the workings of strife and cruelty amongst themselves. The strong trampled on the weak, the married state was violated, and such scenes of rioting and debauchery were witnessed in their midst, that Gibbon says, "Seldom does the history of profane war display such scenes of intemperance and prostitution as were exhibited under the walls of Antioch."

Thus did the conduct and character of the Crusaders exclude the possibility of their doing any good to the nations they visited. "Heedless and unreflecting, they consumed with prodigality the stores of provisions and the water which they had. Like the plague of the locusts, they ate up and destroyed every article of food in the inland country which they traversed. The people among whom they marched either hated them and their designs with a deadly hatred, or were fain to flee before their cruel or rapacious brethren, and they were reduced to awful straits from thirst and famine. In the ex-

tremity of their sufferings they were sometimes compelled to roast and devour the flesh of their infant and adult captives, and acquired the character of cannibals, which was carried abroad and confirmed by spies, who discovered several human bodies preparing for food in their camps." This report the Normans were zealous to spread, in order to heighten the abhorrence and terror of the infidels. Thus debasing was the influence of the Crusades on all with whom they came in contact. Tell us not, then, in bitter mockery, that the "Crusades unfolded a Christian Europe," or were likely to carry the blessings of *enlightenment*, or respect for the social relations, to those with whom they came in contact.

Thirdly. The *results* of the Crusades show that they were not favourable to civilization and moral elevation. If we trace the course of the Crusaders, we find that it was one series of error, misfortune, and crime, ending in their own dispersion or destruction. The doom of the first expedition was a mournful one. "The populace who departed under the conduct of Peter the Hermit, without preparation and without guides or chiefs, and who were followed, rather than led, by some obscure knights, after traversing Germany and the Greek empire, dispersed or perished in Asia Minor."* "Thus perished (says another writer) 300,000 persons of the first Crusaders, ere their more thoughtful brethren had completed their preparations. Yet, so inefficient was the lesson, that vast numbers still flocked under the same standard to encounter the same fate." The savage countries of Hungary and Bulgaria were whitened with their bones, their army was cut in pieces by the Turkish sultan or the Grecian emperor, and myriads perished by the climate, fatigue, and the dangers of the way, the more insuperable as they were unforeseen to these ignorant fanatics. And of the few who returned, they had learned no laws of love, they had been schooled by no kindness, and they settled down in their former state, to their former pursuits, still more gloomy and unlovely than before.

They neither accomplished the object for which they were ostentatiously undertaken, nor produced any enlightening or ennobling effects on the nations. Let us hear the tes-
